VOLUME 14, NUMBER 1
JANUARY 1, 1981

W81-00001 -- W81-00250
CODEN: SWRABW

SELECTED WATER RESOURCES ABSTRACTS (SWRA) is produced by the Office of Water Research and Technology, U.S. Department of the Interior, and published twice monthly by the National Technical Information Service (NTIS), U.S. Department of Commerce.

SWRA is available to Federal agencies and their contractors or grantees in water resources research upon request, citing contract or grant number and sponsoring agency. Write: Office of Water Research and Technology, U.S. Department of the Interior, Washington, DC 20240. The **SWRA Journal** is also available on subscription from NTIS, 5285 Port Royal Road, Springfield, VA 22161. Annual subscription rates for the North American Continent are: Journal only, $100; Journal and Annual Indexes, $125; Indexes only, $50.Other addressees, write for prices.

Some documents abstracted in this journal can be purchased from NTIS. Price codes are given in the entries and a current code-price conversion table is printed on the outside back cover. Other documents are available from originating organizations or authors as indicated in the citation.

Notice to Subscribers

The input system within the Office of Water Research and Technology, U.S. Department of the Interior, is undergoing transition. This action has temporarily reduced the number of reports available for announcement.

Volume 13, Numbers 22 and 23, and 24 are combined in this issue.

384-5

SELECTED WATER RESOURCES ABSTRACTS

A semimonthly publication of the Office of Water Research and Technology,
U.S. Department of the Interior

VOLUME 14, NUMBER 1
JANUARY 1, 1981

The Secretary of the Interior has determined that the publication of the periodical is necessary in the transaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1983.

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

PREFACE

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. These documents cover water resources as treated in the life, physical, and social sciences and the related engineering and legal aspects of the characteristics, supply condition, conservation, control, use, or management of water resources. Each abstract includes a full bibliographic citation and a set of descriptors which are listed in the **Water Resources Thesaurus.** The abstract entries are classified into 10 fields and 60 groups similar to the water resources research categories established by the Committee on Water Resources Research of the then Federal Council for Science and Technology.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several services of the Office of Water Research and Technology. The cumlative SWRA file from 1968 and montlhy updates are available also in magnetic tape through lease from NTIS.

THE OFFICE OF WATER RESEARCH AND TECHNOLOGY DOES NOT PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Comments and suggestions concerning the contents and arrangement of this bulletin are welcome.

Office of Water Research and Technology
U.S. Department of the Interior
Washington, D.C. 20240

CONTENTS

SUBJECT FIELDS AND GROUPS

Please use the edge index on the back cover to locate Subject Fields and Indexes.

01 NATURE OF WATER

Includes the following Groups: Properties; Aqueous Solutions and Suspensions.

02 WATER CYCLE

Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION

Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL

Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Nonwater Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION

Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING

Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA

Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS

Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES

Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION

Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

2A. General

PREDICTION OF BASEFLOW FOR PIEDMONT WATERSHEDS,
Clemson Univ., SC. Water Resources Research Inst.
T. V. Wilson, and J. T. Ligon.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-119091, Price codes: A04 in paper copy, A01 in microfiche. Report No 80, November, 1979. 47 p, 14 Fig, 4 Tab, 4 Ref, 1 Append. OWRT-A-034-SC(1).

Descriptors: *Base flow, *Watersheds, *Mathematical models, *Forecasting, *Excess water(Soils), Moisture uptake, Moisture content, Base runoff, Groundwater discharge, Groundwater flow, Groundwater runoff, Flow, Drainage divides, Basins, Drainage systems, Computer models, Statistics, Statistical methods, Soil moisture, Model studies.

Ability to accurately predict baseflow rates under adverse weather conditions would be beneficial in systems planning for water supplies, pollution dispersion and removal, and recreational facilities. Four Piedmont watersheds and one Sandhill watershed, all unregulated flow, were selected for this study, which used a previously-developed baseflow model to estimate daily baseflow regimes for Piedmont watersheds. Two factors that appeared to give most trouble were (1) the lack of representative watershed precipitation data, and (2) the inability to use simple relationships to estimate surface runoff (which was not part of baseflow). The watersheds were divided into upper and lower zones based on the approximate depth to the water table. Using the nearest available precipitation data, estimated daily evapotranspiration rates, estimated surface runoff, and root zone soil moisture storage capacity, a daily soil moisture balance was used to calculate excessive soil moisture (EXSM); water assumed to contribute to saturated water storage and ultimate baseflow. All baseflow was assumed to be derived from EXSM. A simplified approach permitted the many variable watershed characteristics to do the integrating, and gave results that were reasonably good estimates of baseflow. (Zielinski-IPA)

2B. Precipitation

WEATHER FORECAST NEEDS FROM THE VIEWPOINT OF HYDROLOGY,
Geological Survey, Reston, VA. Water Resources Div.
D. M. Thomas, and T. J. Buchanan.
Available from OFSS, Box 25425, Fed. Ctr., Denver, CO. 80225, Paper copy $1.00, Microfiche $3.50. Geological Survey Open-File Report 80-754, 1980. 10 p, 6 Ref.

Descriptors: *Weather forecasting, *Hydrology, *Meteorology, *Flood forecasting, Reservoir operation, Reliability, Water supply, Water quality, Acid rain.

Hydrologists now depend on directly observed data in their forecasting and only infrequently use meteorological forecasts. Case studies show how reliable meteorological forecasts could be beneficial in flood and drought situations. Hydrologists need meteorological forecasts that recognize spatial variability, that are unbiased, and that have a specified degree of uncertainty. (USGS)
W81-00070

FIELD SITE DIRECTION OF PREPARATORY OBSERVATION FOR DETERMINING EFFECTIVENESS OF PROGRAM OF APPLIED WEATHER MODIFICATION IN THE CANARY ISLANDS,
AIRAO, Inc., Pagosa Springs, CO.
A. H. Schnell.
Completion Report prepared for Water and Power Resources Services, December 12, 1979. 85 p, 9 Ref, 3 Append. 0-07-85-V0031.

Descriptors: *Weather modification, *Climatology, *Meteorological data, Cloud cover, *Islands, Measurement, Dropwise condensation, Artificial precipitation, *Cloud seeding, Meteorology, Precipitation(Atmospheric), Rain, Storms, Water supply, Weather, Clouds, Convections, Nucleation, Weather patterns, Radar, Instrumentation, Remote sensing, *Canary Islands.

This report describes work conducted during the period of December 1979 through July 1980 on field site direction of preparatory observation for determining the effectiveness of a program on applied weather modification in the Canary Islands. Work carried out during this period consisted of observation of small convective systems within the sea of clouds over the Canarian Archipelago, using ground-based radar and airborne instrumentation and cloud condensation nuclei counter and simple drop-recording equipment. These observations fell under a preliminary studies phase. The three basic cloud types that were identified were warm sea clouds, warm orographic clouds, and cold clouds. The limited number of case studies obtained and the numerous observations made during the course of this project seemed to suggest that, for eventual future programs of Applied Weather Modification, especially over the eastern province of the Canary Archipelago, use of materials and techniques to enhance vertical development of isolated cells should be handled with extreme caution. A number of other recommendations related to potential weather modification activities were presented. (Zielinski-IPA)
W81-00096

STANDARD INTENSITY CURVES FOR RAINFALL OF SHORT DURATION (STANDAARD INTENSITEITSKROMMES VIR REENVAL VAN KORT DUURTES),
Bruinette, Kruger, and Stofberg, Johannesburg (South Africa).
W. M. Van Heerden.
The Civil Engineer in South Africa (Johannesburg), Vol 20, No 10, p 261-267, 1978. 11 Fig, 1 Tab, 12 Ref.

Descriptors: *Rainfall intensity, *Duration curves, *Frequency curves, *Classification, Precipitation(Atmospheric), Rates, Meteorology, Precipitation intensity, Mapping, Geolographical regions, Evaluation, Time, Time series analysis, Mathematical studies, Gaging stations, Data collections, Rating curves, *South Africa.

Eight sets of rain intensity-duration-return period curves applicable any place in South Africa are grouped according to intensities. The rainfall events with durations of 5 to 60 minutes, with a point value of 120 minutes, are given on the x-axis and the intensities are given by the values on the y-axis. Rainfall data from sixty-two gaging stations can be used to establish the class of the intensity or one of the existing methods used for intensity determination may be employed. The eight classes of intensities were derived from data previously reported in the literature and the distribution of intensities in relation to duration and frequency is applicable to rainfall analysis in the U.S. and other countries. 2C. Snow, Ice, and Frost

PRELIMINARY BATHYMETRY OF MC CARTY FIORD AND NEOGLACIAL CHANGES OF MC CARTY GLACIER, ALASKA,
Geological Survey, Tacoma, WA. Water Resources Div.
A. Post.
Geological Survey Open-File Report 80-424, 1980. 4 Sheets.

Descriptors: *Bathymetry, *Glaciers, *Alaska, *Glacial drift, *Icebergs, Glacial sediments, Fjords, Scour, Dating, Glaciology, Hydrography, Maps, Profiles, *McCarty Glacier(AK), *McCarty Fiord(AK).

Preliminary bathymetry (at 1:20,000 scale) and other scientific studies of McCarty Fiord, Alaska, Conducted by the Research Vessel Growler in 1978, showed this 15 mile-long waterway to be a narrow, deeply scoured basin enclosed by a terminal-moraine shoal. This valley was formerly filled by McCarty Glacier, which began a drastic retreat shortly after 1909; the glacier reached shallow water at the head of the fiord around 1960. The relative rate of retreat in deep water and on land is disclosed by the slower melting of stagnent ice left in a side valley. Soundings and profiles show the main channel to extend to a depth as great as 957 feet and to have the typical 'U' shape of a glacier-eroded valley; since the glacier's retreat, sediments have formed a nearly level deposit in the deepest part of the fiord. Old forest debris dated by carbon-14 indicates that a neoglacial advance of the glacier began before 3,395 years B.P. (before present); by 1,500 B.P. the glacier filled most of the fiord, and before the glacier culminated its advance around 1860, two glacier-dammed lakes were formed in side valleys. (USGS)
W81-00056

PRELIMINARY BATHYMETRY OF AIALAK BAY AND NEOGLACIAL CHANGES OF AIALIK AND PEDERSON GLACIERS, ALASKA,
Geological Survey, Tacoma, WA. Water Resources Div.
A. Post.
Geological Survey Open-File Report 80-423, 1980. 1 Sheet.

Descriptors: *Bathymetry, *Glaciers, *Alaska, *Glacial drift, *Icebergs, Glacial sediments, Fjords, Scour, Dating, Glaciology, Hydrography, Maps, Profiles, *Aialik Bay(AK), Aialik Glacier(AK), Pederson Glacier(AK).

Preliminary bathymetry (at 1:20,000 scale) and scientific studies of Aialik Bay, Alaska, by the Research Vessel Growler in 1978 disclose that the head of the bay consists of a deep basin enclosed by a terminal-moraine shoal. A much smaller basin, into which Aialik Glacier discharges icebergs, is located west of two islands and a submarine ridge. Comparison of 1978 soundings with U.S. Coast and Geodetic Survey (now National Oceanic and Atmospheric Administration) data obtained in 1912 shows shoaling of about 64 feet in the deepest part of the small basin nearest the glacier and of about 40 feet in the large basin. The time of retreat of Aialik Glacier from the moraine bar is unknown; a faint 'trimline' is still visible in the forest on the east side of the fiord, and a carbon-14 date suggests the retreat could have taken place as recently as 1800. The time of Aialik Glcier's neoglacial advance to the moraine is unknown. Pederson Glacier, which terminates in part in a tidal lagoon or lake, has retreated about 0.90 mile from a moraine judged by Grant and Higgins to have been in contact with the ice about 1896. (USGS)

W81-00081

PRELIMINARY BATHYMETRY OF BLACKSTONE BAY AND NEOGLACIAL CHANGES OF BLACKSTONE GLACIERS, ALASKA,
Geological Survey, Tacoma, WA. Water Resources Div.
A. Post.
Geological Survey Open-File Report 80-418, 1980. 2 Sheets.

Descriptors: *Bathymetry, *Glaciers, *Alaska, *Glacial drift, *Icebergs, Glacial sediments, Fjords, Scour, Dating, Glaciology, Hydrography, Maps, Profiles, *Blackstone Bay(Alaska).

Preliminary bathymetry (at 1:20,000 scale) and scientific studies of Blackstone Bay Alaska, by the Research Vessel Growler in 1978 disclose that the head of the bay consists of two basins separated by

Willard Island and a submarine ridge. Both basins are closed on the north by terminal-moraine bars where Blackstone Glacier and its tributaries terminated as recently as about A.D. 1350; a carbon-14 date of 580 years before present on Badger Point, and old trees farther up the bay, disclose that the glaciers retreated to two narrow inlets at the head of the bay before 1400. The inlets were still glacier-covered until at least 1909. Glaciers in both inlets have continued to retreat; at present they terminate at the head of tidewater, where they discharge small icebergs. Only relatively thin sediments have accumulated in the eastern basin south of the terminal-moraine bar, and most of the bottom is hard and irregular as disclosed by soundings and profiles. The northern part of Blackstone Bay is very deep; at more than 1,100 feet below sea level a large, level accumulation of sediment is present which is presumably as much as 1,000 feet deep and has been accumulating since late Pleistocene glaciers retreated. (USGS)
W81-00138

PRELIMINARY BATHYMETRY OF NORTHWESTERN FIORD AND NEOGLACIAL CHANGES OF NORTHWESTERN GLACIER, ALASKA,
Geological Survey, Tacoma, WA. Water Resources Div.
A. Post.
Geological Survey Open-File Report 80-414, 1980. 2 Sheets.

Descriptors: *Bathymetry, *Glaciers, *Alaska, *Glacial drift, *Icebergs, Glacial sediments, Fjords, Scour, Dating, Glaciology, Hydrography, Maps, Profiles, *Northwestern Glacier(AL), *Northwestern Fiord(AL).

The first preliminary bathymetry (at 1:20,000 scale) and other scientific investigations of Northwestern Fiord, Alaska, were conducted by the Research Vessel Growler in 1978, disclosing this 10.5-mile-long branched waterway to be a deep basin enclosed by a terminal-moraine shoal. The basin was formerly filled by Northwestern Glacier, which began a drastic retreat around 1909 and reached the head of the main arm around 1960. Soundings and profiles show the main channel to be as much as 970 feet deep and to have the typical U shape of a severely glacially eroded valley; since the glacier's retreat, sediments have formed nearly level deposits in the deepest reaches, while the rest of the basin has a hard, rocky bottom. Preneoglacial forest debris dated by carbon-14 indicates Northwestern Glacier to have advanced into the fiord prior to 1,385 years before present (B.P.); a branch glacier evidently advanced into forest 1,635 years B.P. The combined glaciers from several arms culminated on the present terminal-moraine shoal around 1894. (USGS)
W81-00140

2D. Evaporation and Transpiration

WEATHER AND EVAPOTRANSPIRATION STUDIES IN A SALTCEDAR THICKET, ARIZONA,
Geological Survey Tucson, AZ. Water Resources Div.
T. E. A. van Hylckama.
Available from Supt. of Documents, GPO, Washington, DC 20402, Price, $4.00.

Descriptors: *Evapotranspiration, *Tamarisk, *Phreatophytes, *Hydrologic budget, *Water utilization, Analytical techniques, Vegetation, Riparian plants, Consumptive use, Water loss, Hydrologic cycle, Environmental effects, Climatology, Soil moisture, Transpiration, Evaporation, Soil-water-plant relationships, Lysimeters, Arizona, Aerodynamic resistance, Stomatal Resistance.

It is often assumed that flood-plain and riparian vegetation transpires large quantities of water. Because of the large area it occupies in the southwestern United States, saltcedar is especially suspected of doing so. The quantities of water transpired from small areas can be measured directly with evapotranspirometers or lysimeters, but can be determined indirectly faster and more efficiently if valid correlations can be established between such readily measureable ambient inputs as radiation and windspeed and the reaction of plants to such inputs. Observations of environmental conditions and of water use by saltcedar (Tamarix chinensis) were made over a 6-year period. Rough estimates of water use can be made for periods of a month or longer by the use of a few simple methods involving only a few ambient parameters. For precise prediction of water use much more elaborate measurement and recording equipment is necessary, and aerodynamic and stomatal resistances must be taken into account. Although there may be times and locations where transpiration rates are high, there are reasons to believe that vegetation management with the goal of slavaging transpiring water may often not be economically warrented. (USGS)
W81-00157

2E. Streamflow and Runoff

METHODS OF LOW FLOW PREDICTIONS FOR SMALL GEORGIA STREAMS,
Georgia Inst., of Tech., Atlanta.
J. R. Wallace, G. N. Day, W. R. Howard, Jr., and K. J. Wiederkhr.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-109779, Price codes: A08 in paper copy, A01 in microfiche. Environmental Resources Center, Georgia Institute of Technology Report, ERC 03-80, April 1980, 144 p, 55 Fig. OWRT-B-130-GA(1), 14-34-0001-7114.

Descriptors: *Low flow, Droughts, *Runoff forecasting, *Georgia, Streams, *Model studies, Small watersheds, Low flow predictions, Ungaged streams, Waste assimilative capacity, Watershed simulation, Precipitation models.

Low flow in Georgia streams was estimated for use in determining waste assimilative capacity, the amount of oxygen-consuming waste that can be released into a stream without violating water quality standards. Low flow data are also needed for allocation of this resource during times of scarcity. Several approaches to the analysis and prediction of low flow were examined. The first used the concept of a deterministic watershed simulation model to estimate stream flow. The model developed was used to simulate six watersheds in Georgia, two in the mountains, two in the Piedmont and two in the Coastal Plain. Simulated low flows were considerably more accurate for some watersheds than for others. Another approach was statewide estimation of low flow based on data at more than 150 continuous and partial record gaging stations. Zones with similar 7-day average low flow were outlined for different return periods. The potential for using the correlation between precipitation and low flow as a method for predicting low flow was investigated. It was concluded that stream flow-precipitation correlation methods hold promise as a technique for estimating low flows. Analysis of the techniques examined in this investigation led to the conclusion that maps showing zones of average low flow represent best currently available method for estimating low flow in Georgia streams. It is recommended that these maps be used when estimates of low flow are needed on ungaged streams.

LIMITED CONFIDENCE IN CONFIDENCE LIMITS DERIVED BY OPERATIONAL STOCHASTIC HYDROLOGIC MODELS -- COMMENTS,
Cornell Univ., Ithaca, NY. Dept. of Environmental Engineering.
J. Stedinger.
Journal of Hydrology, Vol 47, p 377-380, 1980. 8 Ref. OWRT-A-085-NY(2).

Descriptors: *Streamflow, *Model studies, *Synthetic hydrology, *Stochastic processes, *Statistical methods, Hydrology, River forecasting, Mathematical studies, Sampling, Probability, Statistical models, Time series analysis, Optimization, Statistics, Estimating, Evaluation.

The purpose of this commentary paper was to explain why the results of a study reported earlier by Klemes and Bulu (Journal of Hydrology, Vol 42, p 9-22, 1970) demonstrating that standard procedures for synthetic streamflow generation fail to generate flows which capture the likely range of the sample moments of future streamflow sequences, should have been expected. The Klemes-Bulu study showed that, in particular, the means and standard deviations of monthly flows calculated using the second, third, and fourth 25-year streamflow segments (of four 25-year segments of a 100-year streamflow record) too frequently fell outside 95% confidence intervals. Monthly streamflow models used in the earlier study that reproduce only between month correlations of flows in nearby months often underestimate the year-to-year correlations of annual flows, and for a given month, the variance of the difference between a sample mean and its modeled value is greater than the modeled variance of the generated means used to construct the confidence intervals. A reply prepared by Klemes and Bulu appears in the same issue (Journal of Hydrology, Vol 47, p 381-383, 1980), clarifying this modeling presentation approach in explanation to these comments. CONSERVATION AND FLOW MAINTENANCE DURING DROUGHT,
Rutgers - The State Univ., Brunswick, NJ. Water Resources Research Inst.
W. Whipple.
In: Proceedings of the Conference on Water Conservation Needs and Implementing Strategies, July 9-13, 1979, Franklin Pierce College, Rindge, NH, p 103-116, 1979. 5 Fig, 5 Ref.

Descriptors: *Water conservation, *Droughts, *Flow rates, *Environmental effects, Water policy, Planning, Urbanization, Forecasting, Water rights, Water supply, Water resources development, Runoff, Recharge, Groundwater, Hydrology.

Water supply planning, water quality planning, and comprehensive basin planning are needed to prevent further erosion of environmentally necessary flows during periods of drought. Water supply planners and managers are apt to consider the total quantity of water carried by a stream at any given time to be available for use without consideration of the maintenance of environmental streamflow needs. To combat this situation a comprehensive approach is needed involving tradeoffs between reductions in customer demand, maintenance of environmental stream flow needs, and levels of capital investment in improved facilities. Present Western water laws make this type of approach difficult and appropriate Eastern water laws do not exist. Too often overt conflicts are avoided by making unacknowledged over-appro-

priations. While the establishment of minimum flows is important, it is, however, unrealistic to insist that these flows be maintained under any conceivable conditions. Streams will recover rapidly in most cases if they have zero flow for a few days. Extended zero flow would cause more serious environmental damage. Projections of future hydrology indicate that with development total water available from surface runoff and ground supplies will increase, but more of it will be as flood flows. Natural drought flows and groundwater recharge will be reduced. These forecasts must be considered when planning for future water supplies. (See also W81-00160) (Seigler-IPA)
W81-00172

THE NWS EXTENDED STREAMFLOW PREDICTION TECHNIQUE,
National Weather Service, Silver Spring, MD.
D. C. Curtis, and J. C. Schaake.
In: Proceedings of the Conference on Water Conservation Needs and Implementing Strategies, July 9-13, 1979, Franklin Pierce College, Rindge, NH, p 182-195, 1979. 2 Fig, 1 Tab, 17 Ref.

Descriptors: *Forecasting, *Model studies, *Mathematical models, Streamflow forecasting, Channel flow, Routing, River forecasting, Low-flow frequency, Regression analysis, Droughts, Hydrologic data, Hydrology, Evapotranspiration, Computer models.

The Extended Streamflow Prediction Model (ESP) is a stochastic dynamic model using conceptualizations of catchment hydrology with historical data to produce probabilistic estimates of future streamflows. ESP has a more physically based approach than common regression methods through the use of the conceptual hydrologic model. ESP provides for a more complete description of watershed physics and a probabilistic analysis of model outputs. The model eliminates many of the weaknesses of regression analysis type techniques and is more flexible. ESP utilizes data from the National Weather Service River Forecast System including mean areal precipitation, mean areal temperature, and mean areal evapotranspiration. There are three major hydrologic and hydraulic computational elements, soil moisture accounting, snow accumulation and ablation, and channel routing. Data required other than program control and option information include hydrological model parameters, initial basin conditions, and representative future time series inputs. Two examples given of the use of ESP are the California drought of 1976-1977 and the northern Virginia drought of 1977. Areas for future research include optimal state estimation, short and long term weather forecasts, model error analysis, model output analysis, and analysis of economic impact. SHIFTING LEVEL MODELLING OF HYDROLOGIC SERIES,
Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
J. D. Salas, and D. C. Boes.
Advances in Water Resources, Vol 3, No 2, p 59-63, June, 1980.

Descriptors: *Hydrologic data, *Computer models, *Flow measurement, *Time series analysis, *Stochastic processes, Low-flow frequency, Non-uniform flow, Correlation analysis, Application methods, Simulation analysis, Rivers.

The potential use of shifting level models of time series hydrologic data is discussed, and deficit and run properties are compared with those of certain autoregressive (ARMA) models. Though still in a developmental stage, the shifting level model is better able to reproduce droughts, floods, and other natural, abrupt shifts in streamflow for long-term historical records. Potential applications include modelling the hydrology of equatorial lakes, of sea-current effects along equatorial coastlines, and hydrologic changes related to natural disturbances such as forest fires, earthquakes, landslides and changes in land use. The model is based on a sequence of random variables whose values represent the different levels of streamflow over random time spans. The correlation function of this model is composed of a low-frequency component due to the random shifts of level. When simplified, the correlation structure is identical to that of the ARMA model. In a comparison of shifting level and ARMA models, based on annual flows of the Niger River, it was found that mean maximum accumulated deficit, mean longest negative run length, and mean largest negative run sum for both models are similar. However, variances for the shifting level model are greater than the corresponding variances of the ARMA model. (Titus-FRC)

Ambio, Vol 9, No 3-4, p 187-193, 1980.

Descriptors: *Organizations, *Research and development, *Baltic Sea, Marine biology, Oceanography, Oceans, Administrative agencies, International commissions, Water pollution control, Research facilities, Conferences.

International cooperative bodies which are dealing with Baltic marine problems are named and a brief description of the functions of each body is given. Bodies confined to the Baltic Sea area are the International Baltic Sea Fishery Commission, Committee for the Gulf of Bothnia, Conferences of Baltic Oceanographers, Baltic Marine Biologists, and the ICES/SCOR Working Group on the Study of Pollution of the Baltic. Bodies covering a larger area than the Baltic but with sub-bodies for the Baltic are the International Council for the Exploration of the Sea, International Hydrological Program of UNESCO, Council for Mutual Economic Assistance, Scientific-Technological Cooperation Committee between Finland and the USSR, and the Scientific Committee on Oceanic Research. The Nordic Council, Nordic Council of Ministers, Nordic Council for Marine Biology, Nordic Council for Physical Oceanography, Commission for Economic and Technological-Scientific Cooperation between Denmark and the USSR, and the Soviet-Swedish Committee on Economic, Scientific and Technological Cooperation have wider coverage than the Baltic but have great impact on Baltic research. About half the approximately 350 scientists (mostly biologists and oceanographers) who devote most of their time to Baltic marine science work for one or more of these bodies. Each year, there are 20-25 international meetings on the Baltic. There are about 25 marine research institutions along the Baltic coasts, and about 20 research vessels working on the sea. The author urges that the rigidity of the present structure be relaxed and many scientists allowed to give more of their time to science rather than to organization. (Baker-FRC)

2F. Groundwater

AQUIFER RECHARGE FROM THE 1969 AND 1978 FLOODS IN THE MOJAVE RIVER BASIN, CALIFORNIA,
Geological Survey, Menol Park, CA. Water Resources Div.
A. Buono, and D. J. Lang.
Available from OFSS, Box 25425, Fed. Ctr., Denver, CO. 80225, Paper copy $5.00, Microfiche $4.00. Geological Survey Open-File Report 80-207 (WRO), April 1980. 25 p, 11 Fig, 3 Tab, 14 Ref.

Descriptors: *Groundwater recharge, *Floods, *California, *Streamflow, *Water lvels, Aquifers, Water wells, Flood recurrence interval, Precipitation excess, Surface runoff, Peak dicharge, Flood damage, Hydrographs, *Mojave River basin(CA), *San Bernardino County(CA).

The Mojave River basin, a high desert area in southwestern San Bernardino County, Calif., received 2.3 times the normal annual precipitation during the 1969 and 1978 water years. Precipitation in the mountainous upper part of the watershed is the primary source of flow in the Mojave River. The resulting floods had an instantaneous peak discharge of 18,000 cubic feet per second in 1969, about 100 miles downstream, representing the maximum flood-recurrence interval in the basin of 30 years. The instantaneous peak measured during the 1978 floods at Deep Creek represented the maximum flood-recurrence interval in the basin of 20 years. A comparison of the hydrologic data for the 1969 and 1978 flood periods indicates that although more precipitation occurred in 1969, more recharge occurred in 1978. The factors that caused the greater recharge were: (1) The more evenly distributed precipitation from December 1977 to April 1978, allowing for more uniform surface-water runoff in the Mojave River; (2) the dams constructed in the upper basin after 1969 which regulated floodflow peaks and allowed more water to stay in the basin; and (3) the lower water level in the aquifer in 1978, which made more space available to store the recharge water. Total recharge resulting from the floods is estimated to have been 245,000 acre-feet in the 1969 water year and 282,000 acre-feet in 1978. (USGS)

A QUASI THREE-DIMENSIONAL FINITE-DIFFERENCE GROUNDWATER FLOW MOEL WITH A FIELD APPLICATION,
Maryland Geological Survey, Towson.
G. Achmad, and J. M. Weigle.
Report of Investigations No 33, 1979. 57 p, 22 Fig, 1 Tab, 19 Ref, 4 Append.

Descriptors: *Model studies, *Groundwater, *Flow, *Mathematical models, *Simulation analysis, Aquifers, Aquicludes, Leakage, Aquifer systems, Pumping, Water level fluctuations, Observation wells, Hydrographs, Maryland, Computer programs, *Quasi three-dimensional flow, Finite difference, Worcester County(MD).

This report describes a quasi three-dimensional model which was constructed from a sequence of aquifer areal-flow equations coupled by leakage terms representing flow through the confining beds. In simulating a four-aquifer system in northeastern Worcester County, Md., the model was able to reproduce the hydrographs of several observation wells with differences of less than 1 foot for 60 percent and less than 5 feet for 95 percent of the data points. The computer program of the model is given in the appendices. (USGS)

GROUND WATER FLOW SYSTEMS IN THE PHOSPHATE SEQUENCE, CARIBOU COUNTY, IDAHO,
Idaho Univ., Moscow. Water Resources Research Inst.
G. V. Winter.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-113078, Price codes: A07 in paper copy, A01 in microfiche. Technical Report, March, 1980. 120 p, 45 Fig, 14 Tab, 32 Ref, 5 Append. OWRT-C-7651(No 7253)(5).

Descriptors: Groundwater, Groundwater availability, *Geologic control, *Phosphates, *Geologic formations, Subsurface waters, Idaho, Groundwater resources, *Groundwater movement, Groundwater barriers, *Hydrogeology, Phosphorus, Phosphorus compounds, Geology, Groundwater basins, Hydrology, Rocks, *Caribou County(ID).

Potential impact of phosphate mining on the hydrogeology/hydrology of an area can only be evaluated if the capability of the formations to support groundwater flow systems is understood. A study was conducted to evaluate this capability in the study area, and to test the hypothesis that similar systems exist within the phosphate sequence of geologic units (Dinwoody, Phosphoria, and Wells Formations) throughout a large area of the Western Phosphate Field of Caribou County, Idaho. It was concluded that the formations comprising the phosphate sequence exhibited similar hydrogeologic characteristics throughout the study area. Support for major groundwater flow systems were noted for the upper and lower members of the Dinwoody and Wells Formations. Groundwater flow systems above the Phosphoria Formation were separated from those below the Formation, causing the upper flow systems to be local in extent and the lower flow system to be regional. Findings for the presence/absence of other groundwater flow systems were included. The groundwater information derived from this study should be transferable to other areas where this phosphate sequence is present. Minor variations of the flow system characteristics may occur with variations in physical composition of the formations. (Zielinski-IPA)

A GEOCHEMICAL AND HYDROLOGICAL INVESTIGATION OF GROUNDWATER RECHARGE IN THE ROSWELL BASIN OF NEW MEXICO: SUMMARY OF RESULTS AND UPDATED LISTING OF TRITIUM DETERMINATIONS,
New Mexico Inst. of Mining and Technology, Socorro.
G. W. Gross, and R. N. Hoy.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-114647, Price codes: A07 in paper copy, A01 in microfiche. New Mexico Water Resources Research Institute, New Mexico State University, Las Cruces. Report No. 122, April 1980. 141 p, 3 Fig, 12 Ref, 1 Append. OWRT-A-055-NMEX(4).

Descriptors: *Groundwater recharge, *Tritium, *Hydrologic budget, *Basins, New Mexico, Hydrogen radioisotopes, Deuterium, Radioactivity, Groundwater, Recharge, Natural recharge, Infiltration rates, Inflow, Precipitation(Atmospheric), Geochemistry, Groundwater basins, Stochastic processes, *Roswell basin(NM), Surface-groundwater relationships.

Different approaches were used to study recharge and flow patterns in the Roswell, New Mexico, artesian basin. Isotope determination for tritium, deuterium, and oxygen-18 were made as a function of time and space. Observation well levels, springflow, and precipitation were analyzed by stochastic/numerical approaches. Also, a hydrogeologic survey was made of representative springs in the recharge zone on the basin western flank. An updated listing of tritium activity in precipitation, springs, surface runoff, and subsurface water from over 120 sampling sites in the basin covers 117 pages of the report, and supersedes and continues that reported earlier by the same investigators. Detailed interpretation of the tritium data, while remaining to be done, is expected to yield answers to questions on the effect of basin pumpage on deeper (older) water leakage, on the residence time of groundwater in the southern (Artesia) part of the basin, and on the role of the structure zones in recharge to the Principal Aquifer. The accumulated evidence indicated that the contribution of the Principal Intake Area to the basin recharge was overestimated in the past. Substantial deep leakage contributions from the basin western flank must be included to account for the basin groundwater budget. (Zielinski-IPA)

LINEAR SYSTEM MODELS FOR REGIONAL AQUIFER EVALUATION STUDIES,
Parsons, Brinckerhoff, Quade and Douglas, Inc., New York.
C. T. Bathala, A. R. Rao, and J. A. Spooner.
Water Resources Research, Vol 16, No 2, p 409-422, April 1980. 11 Fig, 9 Tab, 17 Ref. OWRT-C-3277(No 3713)(16) and C-6106(No 5213)(13).

Descriptors: *Aquifer characteristics, *Mathematical models, *Groundwater movement, Hydraulic properties, Model studies, Equations, Storage coefficient, Transmissivity, Surface-groundwater relationships, Pumping, Drawdown, Water levels, Water wells, Well spacing, *Linear systems, Aquifer-stream systems, Regional aquifer systems, Sensitivity analysis.

A generalized linear system model was formulated to analyze several types of groundwater flow problems. An iterative procedure was developed to predict aquifer response due to pumping demand by considering the analytical relationships governing the groundwater flow. Historical pumping rates, groundwater levels, stream stages, and estimated storage coefficients were used as inputs to the model. The model outputs were the aquifer transmissivities and the predicted groundwater levels. The sensitivity of the model to variations in the estimated storage coefficients was investigated. The technique was illustrated by considering a realistic but hypothetical regional aquifer system, and the results were demonstrated to be satisfactory. The technique is insensitive even to large errors in the estimated storage coefficients. The number of simultaneous equations to be solved and hence the computational time required are much smaller than those encountered un the conventional numerical models of aquifer systems. Aquifer transmissivity and storage coefficient values are computed as a part of this procedure, therefore, expensive pumping tests that are usually required to estimate these aquifer parameters are not necessary in this technique. (Visocky-ISWS)

POTENTIOMETRIC SURFACE OF FLORIDAN AQUIFER, SOUTHWEST FLORIDA WATER MANAGEMENT DISTRICT AND ADJACENT AREAS, MAY 1979,
Geological Survey, Tampa, FL. Water Resources Div.
R. M. Wolansky, L. R. Mills, W. M. Woodham, and C. P. Laughlin.
Geological Survey Open-File Report 79-1255, 1979. 1 Sheet.

Descriptors: *Maps, *Aquifers, *Water levels, *Potentiometric level, *Florida, Water wells, Water utilization, Irrigation, Water level fluctuations, *Floridan aquifer, Southwest Florida Water Management.

A May 1979 potentiometric-surface map depicts the annual low water-level period. Potentiometric levels declined 4 to 21 feet between September 1978 and May 1979, in the citrus and farming sections of southern Hillsborough, northern Hardee, southwestern Polk, northwestern DeSoto, and Manatee Counties. Water levels in these areas are widely affected by pumping for irrigation and have the greatest range in fluctuations. Water-level declines ranged from 0 to 6 feet in coastal, northern, and southern areas of the Water Management District. Generally potentiometric levels were higher than previous May levels due to heavy rains in April and May. In parts of Hillsborough, Pasco, and Pinellas Counties, May 1979 potentiometric levels were 18 feet higher than those of September 1978. (USGS)

GROUND-WATER CONDITIONS IN UTAH, SPRING OF 1980,
Geological Survey, Salt Lake City, UT. Water Resources. Div.
L. R. Herbert.
Utah Division of Water Resources Cooperative Investigations Report No 19, 1980. 72 p, 39 Fig, 3 Tab, 2 Ref.

Descriptors: *Groundwater resources, *Utah, *Aquifers, *Withdrawal, *Water level fluctuations, Water quality, Water wells, Water utilization, Water supply, Irrigation, Hydrogeology, Water table, Potentiometric level, Grondwater recharge, Hydrologic data, Precipitation(Atmospheric), Surface-groundwater relationships, Hydrographs, Maps.

This is the seventeenth in a series of annual reports that describe groundwater conditions in Utah. The estimated total withdrawal of water from wells in Utah in 1979 was about 860,000 acre-feet--about 31,000 acre-feet more than in 1978 and 73,000 acre-feet more than the average annual withdrawal during 1969-78. The increase in withdrawal from the amount reported for 1978 was due primarily to increases in withdrawal for public supply. Total withdrawal for public supply in 1979 was about 162,000 acre-feet, which is 33,000 acre-feet more than reported for 1978. Withdrawal for irrigation was 567,000 acre-feet, an increase of 5,000 acre-feet. The quantities closely related to local climatic conditions. Precipitation in 1979 was below average in most of Utah (Natio of water withdrawn from wells are nal Oceanic and Atmospheric Administration, 1980). Of the 33 stations for which graphs of cumulative departure from average annual precipitation are included in this report, 27 had below-average precipitation in 1979. This contributed most significantly to increased withdrawals from wells during 1979. The below-average precipitation in most parts of the State during 1979 resulted in local reduction in ground-water recharge as well as increased withdrawals from wells. This in turn resulted in a general decline of ground-water levels in many parts of the State from spring of 1979 to spring of 1980. Notable exceptions where rises occurred were in areas where local above-average runoff contributed greatly to the recharge of the groundwater reservoir. The total number of wells drilled during 1979, as indicated by well-drillers' reports filed with the Utah Division of Water Rights, was about 35 percent less than reported for 1978. The number of those wells 6 inches or more in diameter drilled for public supply irrigation, and industrial use was about 28 percent less than reported for 1978. (USGS)

2G. Water In Soils

PREDICTING THE EFFECTS OF CHANGING WATER-TABLE LEVELS AND ASSOCIATED SOIL MOISTURE REGIMES FOR SOIL SURVEY INTERPRETATIONS,
Soil Survey Inst., Wageningen (Netherlands).
J. Bouma, P. J. M. de Laat, A. F. van Holst, and Th. J. van de Nes.
Soil Science Society of America Journal, Vol 44, No 4, p 797-802, July-August 1980. 7 Fig, 1 Tab, 14 Ref.

Descriptors: *Water table, *Soil moisture, *Computer models, *Evapotranspiration, Soil types, *Crop production, Unsaturated flow, Water level fluctuations, Grasses, Hydraulic conductivity, Root zone, Depth, Retention, Mapping, Soil survey data.

A one-dimensional computer model for simulating the soil moisture regime was used to calculate evapotranspiration and equivalent productions of grass for six different soils. Input data consisted of rooting depths, moisture retention curves, and hydraulic conductivity curves. Physical boundary conditions were derived from climatic data and depths to water table. Average relative production was calculated for actual water table fluctuations and for lowered levels, thus simulating the effects of groundwater extraction. Productions for the six soils reacted quite differently to lowering of the water table. A classification was developed to characterize the different reactions. A SYMAP computer program was used to produce maps (which were based on soil maps) showing the effects in different soils to lowering of the water table. Storage of basic data on tape allows the production of many maps on demand for natural conditions and for conditions changed by man. Soil survey interpretation thus becomes a matter of offering many choices rather than a qualitative judgment based on actual conditions. The model can be used to express variability of mapping units on a soil map by simulating moisture regimes for the range of soil properties observed within the mapping unit. (Visocky-ISWS)

2H. Lakes

THE ROLE OF ZOOPLANKTON VERTICAL MIGRATION IN STRUCTURING THE PHYTOPLANKTON COMMUNITY,
New Hampshire Univ., Durham. Dept. of Zoology.
J. F. Haney, and C. L. Buchanan.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-112633, Price codes: A05 in paper copy. Water Resource Research Center, University of New Hampshire, Research Report No 30, 1980. 84 p, 32 Fig, 13 Tab, 36 Ref. OWRT-A-044-NH (2), 14-31-0001-5029.

Descriptors: *Zooplankton, *Vertical migration, *Phytoplankton, *Regression analysis, *Distribution patterns, Aquatic animals, Model studies, Lakes, Community depth distribution, Model lake systems, Population depth control, Multiple regression analysis, *Daphnia, Arctic lakes, Light concentration, Food concentration.

Development of a model to predict the effectiveness of zooplankton grazing on phytoplankton requires knowledge of the factors which regulate the depth distribution of both communities. In this study, model lake systems (columns) were evaluated for their usefulness in the study of depth control of zooplankton populations. Simple linear regression and multiple regression analyses were employed to develop predictive models based on these studies under controlled laboratory conditions and in the field. Zooplankton depth regulation was further tested under continuous light in arctic lakes and ponds as well as in experimental columns. The influence of light and food concentration was examined with the experimental columns under controlled conditions. Food concentration strongly regulates the day-depth distribution of Daphnia populations. At high food densities the population mean depth approaches the surface waters and at low food levels the population is found in the deep water. This relationship was described by a linear regression equation. Vertical movements resulting from food changes were almost immediate, although differences were found between long-term and short-term responses. The relationship between temperature changes and population mean depth was also defined. Absolute light intensity was not an important regulator of day-depth and vertical migration in temperate or arctic zooplankton. However, the rate of evening migration in temperate zooplankton and the daytime displacement velocity of arctic zooplankton populations was closely correlated with the relative light change. Implications of these results to models of depth control and grazing by zooplankton are discussed.
W81-00021

HYDROLOGIC SETTING OF WILLIAMS LAKE, HUBBARD COUNTY, MINNESOTA,
Geological Survey, St. Paul, MN. Water Resources Div.
D. I. Siegel, and T. C. Winter.
Available from the OFSS, Box 25425, Fed. Ctr., Denver, CO 80225, $8.00 in paper copy, $3.50 in microfiche. Geological Survey Open-File Report 80-403, 1980. 56 p, 14 Fig, 6 Tab, 19 Ref.

Descriptors: *Hydrology, *Water balance, *Lakes, *Minnesota, *Model studies, Statistical methods, Glacial drift, Precipitation(Atmospheric), Evaporation, Groundwater, Surface waters, Discharge(Water), Flow characteristics, Water quality, Chemical analysis, Hydrographs, Data collections, *Williams Lake(MN), *Hubbard County(MN), *Surface-groundwater relationships.

The hydrology and geology of Williams Lake watershed was studied to evaluate the accuracy of various methods used to determine precipitation and evaporation in lake water-balance studies and to define a lake and ground-water system according to approaches suggested by theoretical modeling studies. Regression analysis between estimated and measured precipitation at the lake showed that the accuracy of regionalization techniques is dependent on the closeness of the data network to the lake. For individual storms, the average-value method was found to be better than either the weighted average or isohyetal methods of determining precipitation, but it was least accurate in estimating 14-day average precipitation. The amount of evaporation calculated by the mass-transfer method ranged from 2 to 7 inches per month from July to October 1978, depending on the method used to determine the mass-transfer coefficient. Test drilling indicated that 30 to 150 feet of sand and gravel overlies till in the Williams Lake watershed. A sand lens about 50 feet thick occurs within the till. The configuration of the water table and vertical-head gradients measured from July to December 1978 indicate that ground water moves into the lake from the south and east and moves from the lake into the ground-water reservoir to the west. Preliminary numerical models indicate that the sand lens within the till is effectively isolated from the flow system interacting with the lake and that both inseepage and outseepage were about 1.4 inches from mid-July to mid-October 1978. When estimated as a residual in a water balance, ground water showed a net outseepage only of 1.47 inches. (USGS)

THE EFFECTS OF USING GROUND WATER TO MAINTAIN WATER LEVELS OF CEDAR LAKE, WISCONSIN,
Geological Survey, Madison, WI. Water Resources Div.
R. S. McLeod.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-197593, Price codes: A03 in paper copy, A01 in microfiche. Geological Survey Water-Resources Investigations 80-23, April 1980. 35 p, 17 Fig, 4 Tab, 6 Ref.

Descriptors: *Lakes, *Water levels, *Effects, *Groundwater, *Wisconsin, Hydrogeology, Water level fluctuations, Flow characteristics, Aquifers, Seepage, Pumping, Recharge, Hydrologic budget, Water quality, Physical properties, Chemical analysis, Limnology, Cedar Lake(WI), Inflow, Water transfer.

Cedar Lake, a kettle lake with no surface inlet or outlet, was studied to evaluate the feasibility of maintaining water levels of lakes in the glaciated kettle moraine area of eastern Wisconsin by pumping ground water into them. A volume of water equivalent to that needed to raise the lake level 47 inches was pumped from the shallow aquifer system into Cedar Lake between February 1 and September 30, 1977. The water budget for the lake during this period indicated that approximately 90 percent of pumped water was either recycled from the lake to the well or otherwise lost as seepage from the lake. There were no identifiable changes in measured physical and chemical characteristics of lake water during the pumping period, nor were there identifiable changes in the number or makeup of the phytoplankton community. Differences in physical and chemical characteristics of lake water and ground water added to the lake probably were not great enough to cause changes within the lake. (USGS)

ARCTIC INVESTIGATIONS OF SOME FACTORS THAT CONTROL THE VERTICAL DISTRIBUTIONS AND SWIMMING ACTIVITIES OF ZOOPLANKTON,
New Hampshire Univ., Durham. Dept. of Zoology.
C. L. Buchanan.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-118267, Price codes: A06 in paper copy, A01 in microfiche. Ph.D. Dissertation, 1978. 103 p, 26 Fig, 9 Tab, 73 Ref. OWRT-A-0440NHL1), 14-31-0001-5029.

Descriptors: *Zooplankton, *Vertical migration, *Phytoplankton, Distribution patterns, Aquatic animals, *Community depth distribution, *Population depth control, *Daphnia magna, Arctic lakes, Diel cycle.

The vertical distributions and movements of zooplankton populations in arctic lakes and ponds were studied. Plexiglas columns, which were surrounded on four sides by a light tight chamber and exposed to natural light from above, were used to study the vertical distributions and movements in closer detail and to measure zooplankton swimming rates. Populations did not undergo diel vertical migrations under continuous light or under long day photoperiods with dark nights. Extreme temperatures depressed the population mean depth, and diel temperature fluctuations could cause vertical movements in pond and column populations. A diel cycle was observed in the swimming rates of zooplankton populations exposed to both continuous light and long day photoperiods, with highest rates in the afternoon and sometimes in the morning. The cycle of swimming activity appears to be based in an endogenous rhythm, and could cause a slight vertical migration in zooplankton populations when phototactic orientation cues were weak. Zooplankton were transferred north and south to different light cycles to test the dependence of the diel cycle of swimming activity upon light. High or low temperatures changed the absolute rate of swimming activity but apparently did not affect the timing of the diel cycle. The behavior of a temperate species, D. magna, which was imported from New Hampshire, was similar to the behavior of species indigenous to the arctic. The association of zooplankton behavior with morphological and physiological features and the variation in vertical distribution caused by environmental and physiological factors are discussed in terms of the selective forces on vertical migrations.
W81-00084

DIEBACK ROLE OF MYRIOPHYLLUM SPICATUM IN MONROE RESERVOIR, INDIANA,
Indiana Univ. at Bloomington. Dept. of Biology.
D. H. Landers, and D. G. Frey.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-115685, Price codes: A07 in paper copy, A01 in microfiche. Water Resources Research Center, Purdue University, West Lafayette, Indiana. Technical Report No 134, September 1980. 105 p, 23 Fig, 16 Tab, 70 Ref, 2 Append. OWRT-B-099-IND(1).

Descriptors: *Myriophyllum spicatum, *Ammonia, Nitrogen, *Dieback, Senescence, Cholorphyll, Phytoplankton, *Monroe Lake(IN), *Chemical reactions, *Lakes, *Limnology, *Seasonal, Nutrients, Phosphates, Nitrates.

Enclosures (2-m diameter) were placed in the littoral zone of Monroe Reservoir, Monroe Co., Indiana, to evaluate the chemical and biological effects of late summer dieback of Myriophyllum spicatum. Aerial photography, combined with quadrat sampling, was used to measure standing crop at peak summer biomass. Plant tissue analysis was applied to total biomass estimates to determine potential N and P release from senescing macrophytes. At the time of dieback, considerable pulses of Soluble Reactive Phosphorous (SRP), NH3-N and NO3-N were detected in the enclosures with plants and the adjacent open water sites. These nutrient inputs were associated with episodes of normal macrophyte senescence and decay. Chlorophyll a increased greatly in response to these nutrient inputs, indicating important increases in phytoplankton production as a direct consequence of macrophyte dieback. Crashing autumn phytoplankton populations were responsible for additional pulsed inputs of SRP, NH3-N and NO3-N in enclosed and open water locations. Realized nutrient inputs from senescent M. spicatum are estimated to represent as much as 20% of the annual P budget, and not more than 2.2% of the annual N budget for the reservoir.
W81-00085

AN ANNUAL BUDGET OF REDOX ACTIVE MATERIALS IN A LAKE,
Connecticut Univ., Storrs.
P. H. Rich.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-115644, Price codes: A02 in paper copy, A01 in microfiche. Completion Report, August 15, 1980. 13 p, 3 Fig, 1 Tab, 2 Ref. OWRT-A-071-CONN(5).

Descriptors: *Oxidation-reduction potential, *Lakes, *Sediment-water interfaces, *Water quality, *Inorganic compounds, *Water chemistry, Lake sediments, Bottom sediments, Sediments, Mud-water interfaces, Ponds, Bodies of water, Sediment discharge, Peak discharge, Redox potential, Chemical reactions, Oxidation, Reduction(Chemical), Water properties, Carbon dioxide, Oxygen, Oxygen demand.

The objectives of this project covered (1) the determination of gross and net flux of iron, nitrogen, and sulfur compounds (redox-active) between interstitial water of surface sediments and the overlying lake water, through one annual cycle; (2) the determination of a synoptic material budget for the redox-active compounds in a small bog lake watershed; and (3) correlation of mineral activity in lake water and outflow stream with anaerobic benthic metabolism. It was noted that 50% more reducing power was generated as reduced alternate terminal electron acceptors in the lake (Durham Pond) as seen by reduction of oxygen to water; hence, areal hypolimnetic carbon dioxide increments better estimated total lake metabolism than areal hypolimnetic oxygen deficits. The watershed supplied more reducing power as dissolved organic matter than it supplied alternate electron acceptors on an annual basis. Finally, alternate electron acceptors were stored in oxidized form in surface sediments during circulation and high discharge periods, and used during both summer and winter stratification and low discharge. Hence, current input/output nutrient models accounted for a major biochemical energy transformation entraining redox-active elements and correlated within the lake ecosystem. (Zielinski-IPA)

CHANGES IN PHOSPHORUS CONCENTRATIONS DUE TO MIXING BY MOTORBOATS IN SHALLOW LAKES,
University of Central Florida, Orlando. Engineering and Industrial Experiment Station.
Y. A. Yousef, W. M. McLellon, and H. H. Zebuth.
Water Research, Vol 14, No 7, p 841-852, 1980. 9 Fig, 8 Tab, 22 Ref.

Descriptors: *Lakes, *Mixing, *Water quality, *Phosphorus, *Florida, Boats, On-site investigations, On-site tests, Turbidity, Data collections, Chlorophyll, Methodology, Nutrients, Water sampling, Dissolved oxygen, Propellers, Mechanical equipment, *Lake Claire(FL), *Lake Mizell(FL), *Lake Jessup(FL), Orthophosphorus, Organic carbon.

Recreational motorboats equipped with engines varying from 28 to 165 horsepower were operated at three selected Central Florida lakes. Also, a pair of isolation chambers representing aquatic habitats were placed in each lake for control and mixing studies. Mixing in isolation chambers was performed by small electrical motors connected to two blade propellers. Agitation of the water column in the lake mixing stations and inside the isolation chambers increased water turbidities and phosphorus concentrations. The increase in the orthophosphorus content for Lakes Claire, Mizell, and Jessup averaged 43, 16, and 73%, which corresponded to an average of 46, 24, and 105 mg-P of orthophosphorus resuspended per square meter of the bottom sediments, respectively. Similarly, the increase in the total phosphorus content for Lakes Claire, Mizell, and Jessup averaged 39, 28, and 55%, which corresponded to an average of 84, 58, and 249 mg-P/sq m, respectively. The increase in turbidity and phosphorus content occurred at a much higher rate than the rate of decline after cessation of mixing. The increase in phosphorus content could result in an increase in lake productivity as noticed from the increase of chlorophyll a concentrations in lake mixing stations. (Humphreys-ISWS)

PREDICTING FLUXES OF LATENT AND SENSIBLE HEAT OF LAKES FROM SURFACE WATER TEMPERATURES,
Florida Univ., Gainesville.
R. G. Bill, Jr., A. F. Cook, L. H. Allen, Jr., J. F. Bartholic, and T. Maki.
Journal of Geophysical Research, Vol 85, No C1, p 507-512, January 20, 1980. 5 Fig, 1 Tab, 14 Ref. OWRT A-031-FLA(3), 14-34-0001-8010.

Descriptors: *Heat flow, *Lakes, *Water temperature, On-site investigations, Measurement, Evaporation, Air temperature, Humidity, Winds, Instrumentation, Model studies, Mathematical models, Equations, Heat, Latent heat, Heat transfer, Correlation analysis, Meteorology, Limnology, Eddy correlation.

Wind velocity, air temperature, and humidity fluctuations were measured over Orange Lake, Florida, using an ultrasonic anemometer-thermometer and Lyman alpha humidity sensor. Latent and sensible heat fluxes were calculated from the data using the eddy correlation technique. Lake temperature at a 2.5-cm depth was measured in order to compare eddy correlation results with fluxes and the Bowen ratio predicted by the formulae of Hicks and Priestley and Taylor in which temperature is the sole parameter. Bowen ratio results were in good agreement with the formulations of Hicks and Priestley and Taylor if property values were evaluated at a temperature intermediate to the lake and 10-m air temperature. Disagreement with fluxes predicted by Hicks indicates that such formulations are inadequate for short-term flux evaluations under the meteorological conditions in which surface water temperature is changing with time. THE USE OF PERIODIC LIGHT APPLICATIONS OF ROTENONE AS A MANAGEMENT TECHNIQUE FOR SMALL IMPOUNDMENTS,
Purdue Univ., Lafayette, IN. Water Resources Research Center.
G. S. Libey, and L. E. Holland.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-118770, Price codes: A03 in paper copy, A01 in microfiche. Technical Report No 132, September 1980, 39 p, 7 Fig, 7 Tab, 28 Ref. OWRT-A-054-IND(1).

Descriptors: *Fish management, *Rotenone, *Farm ponds, *Fish control agents, Pesticides, Bluegill, Bass, Balance of nature, Ecosystems.

A light (.1 ppm) application of rotenone was administered to two experimental ponds on June 26, 1979 in an effort to reduce larval bluegill survival through direct toxicity and by reduction of the food base (zooplankton) leading to starvation of the larvae. Zooplankton reductions caused by the toxicant could not be distinguished from natural fluctuations observed in the control pond. An average of .1 ppm concentration of rotenone caused noticeable increases in larval bluegill mortality without observed mortality or stress in bass or larger bluegill. A dosage of .07 ppm rotenone was observed to have minimal influence on larval bluegill numbers. An accurate, properly timed, light application of rotenone has potential as a useful and inexpensive (about $3) technique to

manage ponds with excessive prey (bluegill) production.

2J. Erosion and Sedimentation

CROSS-SECTION, VELOCITY, AND BED-LOAD DATA AT TWO EROSION SITES ON THE TANANA RIVER NEAR FAIRBANKS, ALASKA, 1979,
Geological Survey, Anchorage, AK. Water Resources Div.
R. L. Burrows.
Available from the OFSS, Box 25425, Fed. Ctr., Denver, CO 80225, $5.50 in paper copy, $3.50 in microfiche. Geological Survey Open-File Report 80-699, 1980. 32 p, 22 Fig, 4 Ref.

Descriptors: *Bed load, *Erosion, *Rivers, *Alaska, *Streamflow, Flow rates, Measurement, Sediment transport, Particle size, Sieve analysis, Hydraulics, Retaining walls, Hydrologic data, *Tanana River(AK), *Fairbanks area(AK).

In an effort to relate river processes to vertical and lateral erosion at two sites on the Tanana River in the vicinity of Fairbanks, Alaska, measurements of depth, velocity, and bedload-transport rates were made at several sections at each site. To facilitate comparison of the river processes and ongoing erosion, compilation and graphic presentation of the velocity distributions and bedload-transport rates are presented in conjunction with cross-section configuration immediately adjacent to the area of erosion. Dry sieve analyses of the bedload samples give particle-size distribution. Approximately 85 to 95% of the material in transport at both sites was in the sand range (>0.062 millimeter <2.0 millimeter). (USGS)

2L. Estuaries

OCCURRENCE OF DAPHNIA PULEX IN LAKE ST. LUCIA,
Natal Univ., Pietermaritzburg (South Africa). Dept. of Zoology.
S. J. M. Blaber, and N. Rayner.
South African Journal of Science, Vol 75, No 2, p 87, February 1979. 3 Ref.

Descriptors: *Daphnia, *Freshwater, *Estuarine environment, *Salinity, *Salt tolerance, Surface waters, Lakes, Plankton nets, Plankton, Daphnia pulex, South Africa, *Lake St. Luica(South Africa).

In August 1978, relatively large numbers of Daphnia pulex (Cladocera) were captured in South Lake St. Lucia, South Africa. They were captured during routine monthly plankton sampling in surface waters of 11% salinity, with no layering, and a temperature of 21 degrees C. Clarke-Bumpus nets were used. They were fitted with a flow-meter and 70 micrometer mesh net and a 'D' net (crossbar of 30 cm and an arch of 19 cm maximum height) also fitted with a 70 micrometer mesh net. None was captured in the 'D' net. D. Pulex is a freshwater group and their appearance in an estuarine system is significant. It is believed that they could have entered the system from the Mkuze River, 30 km to the north allowing a gradual acclimatization to saline water as a horizontal salinity gradient exists from north to south at St. Lucia. Because D. pulex has a freshwater distribution, little is known of its salinity tolerance. Its upper tolerance limit to magnesium chloride is 0.12 g/l, its tolerance of sodium being somewhat greater. FRESHWATER RESOURCES OF BIG PINE KEY, FLORIDA,
Geological Survey, Tallahassee, FL. Water Resources Div.
C. E. Hanson.
Available from OFSS, Box 25425, Fed. Ctr., Denver, CO. 80225, Paper copy $5.00, Microfiche $3.50. Geological Survey Open-File Report 80-447, 1980. 36 p, 15 Fig, 6 Tab, 5 Ref.

Descriptors: *Freshwater, *Groundwater resources, *Available water, Aquifer characteristics, Water quality, Saline water intrusion, Tidal effects, Water level fluctuations, Rainfall, Pumping, Water wells, Water analysis, Potable water, Potential water supply, Planning, Hydrographs, Data collections, Freshwater lens, *Big Pine Key(FL), Saline water-freshwater interfaces.

The principal freshwater-bearing unit underlying Big Pine Key, Fla, is a layer of oolitic limestone averaging 19 feet in thickness. The freshwater exists in two separate lenses, one in the northern half of the island and one in the southern half. The slightly larger north lens is separated from the south lens by a low-lying land area 1 to 3 feet above mean sea level. The lenses float on saltwater in the aquifer and are affected by tidal fluctuations. The areal and depth configuration of the lenses fluctuate in response to rainfall, evapotranspiration, lateral and vertical losses, and pumpage from local wells. The lenses are not a major source of freshwater. Only a small amount of the freshwater in the lenses can be removed before saltwater intrusion will occur. (USGS)

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

3A. Saline Water Conversion

RESEARCH AND DEVELOPMENT ON A SPIRAL-WOUND MEMBRANE SYSTEM FOR SINGLE-STAGE SEAWATER DESALINATION,
UOP Inc., San Diego, CA. Fluid Systems Div.
R. L. Riley, and C. E. Milstead.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-105918, Price codes: A10 in paper copy, A01 in microfiche. Final Report to Office of Water Research and Technology, August 1977, 207 p, 52 Fig, 63 Tab, 14 Ref. OWRT (No 6516) (1), 14-34-0001-6516.

Descriptors: *Membranes, *Reverse Osmosis, *Desalination, *Sea water, *Spiral-Wound Elements, Separation techniques, Desalination processes, Desalination apparatus, Research and development.

Spiral-wound thin-film composite membrane systems have been developed for seawater desalination by reverse osmosis. Among the most promising membranes developed are a family of aromatic poly (ether/amides) and poly)ether/ureas). These membranes exhibit outstanding transport, mechanical, thermal, biological, and chemical properties. The major effort during the program focused on the poly (ether/amide) thin-film composite membrane, designated PA-300. Membrane fabrication optimization studies resulted in the scale up of the process from 14-in. to 38-in. wide membrane produced on a continuous basis. Characterization studies under various operating conditions were conducted. For single-pass seawater desalination, stable water fluxes of 9.0 gal/ft super 2-day and sodium chloride rejections of greater than 99% were attained with two- and four-in. diam. PA-300 membrane elements at an applied pressure of 650 psi in pilot plant tests at Sea World Marine Park in San Diego, CA. Water fluxes of 10-13 gal/ft super 2-day and rejections of 98-99% were attained with 30-45% water recovery at an applied pressure of 800 psi with four- and six-in. diam. PA-300 membrane elements in two-stage seawater desalination pilot tests at Wrightsville Beach, NC. The establishment of large-scale continuous membrane production, combined with excellent seawater performance of spiral-wound elements demonstrates a significant advance toward the commerical application of thin-film composite membranes.
W81-00001

DEVELOPMENT OF A CHLORINE-RESISTANT COMPOSITE MEMBRANE FOR REVERSE OSMOSIS,
Envirogenics Systems Co., El Monte, CA.
A. F. Graefe, and D. Wong.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-115420, Price codes: A03 in paper copy, A01 in microfiche. Final Report No 2001-20 to Office of Water Research and Technology, August 1980, 40 p, 4 Ref. OWRT-C-80 298-5 (No 8529)(1), 14-34-0001-8529.

Descriptors: *Reverse osmosis, *Membrane, Composite, *Seawater, Brackish water, *Desalination, Polysulfone, Sulfonated polysulfone, Lactic acid, Non-Cellulosic.

The objective of this program was to develop chlorine-resistant non-cellulosic composite desalination membranes that would exhibit a minimum flux of 10 gfd at greater than 99% salt rejection when tested with synthetic seawater at 1000 psi, and/or a minimum flux of 15 gfd at greater than 90% salt rejection when tested with 5000 ppm sodium chloride at 250 psi. The membrane selected for this purpose consisted of a sulfonated polysulfone barrier layer overlaid on the surface of unmodified microporous polysulfone as a support. In work involving sulfonated polysulfone dense films, a study was conducted in which various cloth-backed polysulfone supports were pretreated with aqueous lactic acid, followed by brushing with 0.5% sulfonated polysulfone in 2-methoxyethanol. The purpose of the lactic acid was to prevent intrusion of sulfonated polysulfone into the support pores. The best membrane specimen exhibited a water flux of 32.3 gfd at 94.5% salt rejection when tested with 0.5% sodium chloride at 250 psi. These data exceeded the program performance goal set for brackish water. Another membrane showed 11.3 gfd at 90.1% salt rejection when tested under the same conditions. However, several attempts to reproduce these results were unsuccessful. Several sulfonated polysulfone composite membranes containing asymmetric barrier layers were fabricated by brush-coating microporous polysulfone supports with sulfonated polysulfone in 2-methoxyethanol, followed by gelation in water at 1C. Salt rejection values for these membranes, when tested under brackish water conditions, was limited to about 90%.
W81-00002

DESIGN STUDY OF THE VTE BOILER CYCLE FOR THE DESALINATION OF SEA WATER VOLUME 1. MAIN REPORT AND APPENDIX A,
Envirogenics Systems Co., El Monte, CA.
I. Kamal.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-113151, Price codes: A10 in paper copy, A01 in microfiche. Final Report to Office of Water Research and Technology, January 1980. 180 p. OWRT-C-80277-S(No 8565)(1), 14-34-0001-8565.

Descriptors: *Desalination, *Sea water, *Desalination apparatus, *Design, *Cost comparisons, Efficiencies, Evaluation, Boilers, Heat transfer, Computer programs, *VTE boiler.

Flow sheets have been developed for the VTE boiler cycle, which is a dual-purpose power/desalination system. Computer programs have been written and used to calculate equivalent performance ratios and process data for the VTE boiler and the conventional dual-purpose plant with both extraction and back-pressure schemes of steam supply to the evaporator. High EPRs are obtained for the VTE boiler when (a) the heating steam is withdrawn from the turbine at a low pressure, (b) the secondary turbine is designed for high efficiency, (c) the number of effects in the VTE boiler is small and (d) the temperature driving potential is small. The thermal loss to the power cycle is low, with the VTE boiler acting like a moisture separator returning dry, steam to the turbine cycle at condi-

tions close to those under which the steam was withdrawn. Cost studies have been carried out for the VTE boiler and the conventional system for 50 MWe/1 mgd. The studies show that the energy requirement of the VTE boiler is less than half that of the conventional plant when both are designed for optimum performance. Further work on the development of economical and efficient low-pressure turbines is necessary in order to realize the potential of the VTE boiler.

A PROCESS DESIGN OF A 60,000 GALLON PER DAY VACUUM FREEZING EJECTOR ABSORPTION PILOT PLANT,
Chicago Bridge and Iron Co., IL.
V. F. Allo, G. E. Engdahl, J. A. Nail, T. J. Nowak, and D. C. Stafford.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-114688, Price codes: A07 in paper copy, A01 in microfiche. Final Report to U. S. Department of the Interior, Office of Water Research and Technology, July, 1980. 118 p, 2 Append. OWRT-C-90058-D(No 9512)(2), 14-34-0001-9512.

Descriptors: *Desalination plants, *Design specifications, *Pilot plants, *Desalination processes, Design, Freezing, Engineering, Construction, Hydrologic aspects, Design data, Design standards, Heat balance, Design criteria, Crystallization, Water purification, Facilities.

A conceptual design study was completed of the vacuum freezing ejector absorption (VFEA) process, a freeze desalination process in which water vapor from a vacuum freezer is compressed by combined action of a streamjet ejector and an absorption refrigerator. The development program was intended to prove technical and economic feasibility of this process. The report includes design specifications for a 60,000 gallons per day pilot plant, complete with detailed equipment specifications and engineering drawings. Construction of a VFEA pilot plant and advancement of the VFEA process through the pilot and demonstration phases was recommended on the basis of indicated lower water costs for the VFEA process. The VFEA process retains the intrinsic advantages of freezing processes of having no pretreatment, negligible scaling and fouling, and minimal corrosion. However, the VFEA process utilizes low grade thermal energy more efficiently than any existing desalination process. The projected power costs for the VFEA process were forecasted to be less than those attainable in the foreseeable future by any distillation or membrane plant in seawater desalting service. A VFEA computer program model was designed for steady state plant mass and heat balance to simulate effects of saline feed factors on plant performance. (Zielinski-IPA)

RESEARCH ON OXYGEN IN THE FEED WATER TO A REVERSE OSMOSIS PILOT PLANT AT THE WRIGHTSVILLE BEACH TEST FACILITY,
Office of Water Research and Technology, Washington, DC.
R. S. Robinson.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-113219, Price codes: A06 in paper copy, A01 in microfiche. Final Report (1980), 84 p, 4 Fig.

Descriptors: *Desalination, *Reverse osmosis, *Feedwater pretreatment, Flux enhancement, *Pilot plants, Desalination processes, *Oxygen, Sea water, Temperature, Wrightsville Beach(NC).

An evaluation was made on the influence of dissolved and undissolved oxygen (O2) in the feed water to a spiral wound seawater reverse osmosis (R.O.) pilot plant. A series of tests were conducted with O2 either added to or deaerated from the seawater. Use of additives to improve salt rejection also was evaluated. Changes in ambient temperature flux and salt rejection performance of the R.O. elements were determined as a function of O2 addition or deletion from feedwater.
W81-00080

WATER STORAGE CONTROL FOR REVERSE OSMOSIS SYSTEM,
Desalination Systems, Inc., Escondido, CA. (Assignee).
R. A. Tondreau, and D. T. Bray.
U.S. Patent No 4,190,537, 6 p, 4 Fig, 4 Ref. Official Gazette of the United States Patent Office, Vol 991, No 4, p 1370-1371, February 26, 1980.

Descriptors: *Patents, *Desalination, *Water treatment, Reverse osmosis, Membrane processes, Separation techniques, Semipermeable membranes, Desalination apparatus.

A reverse osmosis system employs a tank for storing permeate under a pressure which is a portion of the pressure of feed water introduced into a pressure resistant container housing a semipermeable membrane cartridge. Control means such as an automatic valve, preferably of the double diaphragm type, in the line introducing feed water closes to shut off feed water flow when the pressure in the permeate storage tank reaches a first predetermined value, less than the feed water pressure, and re-opens to re-establish feed water flow at a second predetermined pressure lower than the first or shut-off pressure. A constricted passageway device such as a venturi in the pipe or connection between a dispensing device such as a faucet and the permeate storage tank has its throat communicating with the sensing conduit for actuating the feed water control valve. When the dispensing faucet is opened, flow of permeate through the venturi creates an amplified and drastically reduced pressure in the sensing conduit, and applies a servo or magnified actuation force to the valve in the re-open end of its control range. (Sinha-OEIS)

EVALUATION OF TECHNICAL MATERIAL AND INFORMATION FOR SEAWATER DESALTING DEMONSTRATION PLANTS.
Boyle Engineering Corp., San Diego, CA.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-118804, Price codes: A08 in paper copy, A01 in microfiche. Completion Report prepared for Office of Water Research and Technology, August, 1980. 81 p, 38 Ref, 6 Append. OWRT-C-00183-D(No 0453)(1).

Descriptors: *Desalination plants, *Reverse osmosis, *Sea water, *Water shortage, *Evaluation, *Water purification, *Sites, Saline water, Oceans, Salinity, Saline water conversion, Desalination processes, Water supply, Salt extraction, Water desalting, Appraisals, Demineralization, Separation techniques, Osmosis, Potable water, Islands.

Evaluation was conducted of technical information/material provided by applicants to the OWRT Desalting Demonstration Plant Program, authorized by P.L. 95-84 and 95-467 to demonstrate state-of-the-art in desalting technology. The evaluation used eight criteria: interest and commitment; and considerations for general site, desalting needs, demographics and socio-economics, water supply, financial, energy, and environmental. Twenty sites located in thirteen states, the Mariana Islands, and the Virgin Islands were evaluated under these criteria. The sites were ranked by raw cumulative score. Sites with critical water needs were identified in both small and large cities. Comments were provided on the top ten ranked sites. The top ranked site to demonstrate single-stage reverse osmosis (RO) desalination was Grand Isle, Louisiana. The second ranked site was Key West, Florida, partly since its water shortage has become more acute than two years ago. It was determined that all twenty site applications were justified for consideration in the seawater RO demonstration plant program and that more than half would have been excellent demonstration plant sites, but critical water shortage of the two top ranked sites and other qualifications mandated their high rankings. (Zielinski-IPA)
W81-00199

DEVELOPMENT OF COMPOSITE HOLLOW FIBERS,
Bend Research, Inc., OR.
R. W. Baker, R. P. Barss, and H. K. Lonsdale.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-119554, Price codes: A03 in paper copy, A01 in microfiche. Final Report of Phase I, March 1980, 40 p, 19 Fig, 7 Tab, 10 Ref. OWRT-S-0017(No 7552)(1), 14-34-0001-7552.

Descriptors: *Reverse osmosis, *Desalination, Hollow fibers, Fiber spinning, Composite membrane.

The objective of this program is to demonstrate the feasibility of using inside-skinned composite hollow fibers for brackish water desalination via reverse osmosis. Composite hollow fibers potted in modules with tube-side feed should be more resistant to fouling and less expensive than current module designs, partly because expensive pretreatment of the feed is unnecessary and partly because the fibers are self-supporting and do not require expensive pressure-containment vessels. The performance of these fibers compares favorably with current cellulose acetate brackish water membranes, and is superior to commercial brackish water hollow fiber systems. (Rykken-Bend)

MULTI-STAGE FLASH DISTILLATION PROCESSES,
Technische Hogeschool, Delft (Netherlands)
A. W. Veenman
Effluent and Water Treatment Journal, Vol 20, No 8, p 371-375, 377, August, 1980. 9 Fig, 1 Tab, 11 Ref.

Descriptors: *Desalination, *Flash distillation, Heat exchangers, *Operating costs, *Pilot plants, Desalination apparatus, Desalination processes, Distillation, Long-tube vertical distillation, Scaling, Evaporators, Condensers, Multi-stage flash distillation.

A new system for desalination of ocean water is described. It is based on multi-stage flash distillation technology which is presently the dominant conventional method. In the new system, costs of energy consumption are reduced. Less specific heat is required for evaporation, the fouling factor of the heat exchanger is reduced, and the product output per volume is increased. The new system combines a vertical evaporator with a fluidized bed heat exchanger in one integrated column. Evaporation takes place in a vertical series of chambers each at a reduced saturation pressure. Condensation occurs simultaneously with the transfer of heat to feedwater in the heat exchanger. This is achieved in parallel condenser tubes partially filled with solid particles in a fluidized state. The system has been in operation for three years in pilot plants in the Netherlands. 3B. Water Yield Improvement

EXPANSION VERSUS CONSERVATION OF WATER SUPPLY,
Library of Congress, Washington, DC.
W. Viessman.
In: Proceedings of the Conference on Water Conservation Needs and Implementing Strategies, July 9-13, 1979, Franklin Pierce College, Rindge, NH. p 117-121, 1979. 4 Ref.

Descriptors: *Water supply development, *Water conservation, *Water resources development, *Water supply, Planning, Drought, Water shortage, Forecasting, Water policy, Water costs, Environmental effects, Alternate planning, Economic feasibility, Water resources.

Despite the current emphasis on water conservation practices, there is a need for new water supply development. Conservation will not solve all of our water problems. Even with maximum conservation the water saved would soon be assimilated in new growth especially in water-short rapid growth areas such as the Southwest. Also, there are risks associated with the conservation approach to water management. In the past many areas survived droughts because there was room to con-

serve, but with maximum conservation already in place during normal times there is no margin of safety for times of drought. Uncertainty about the effectiveness of many water conservation measures also puts more emphasis on continued water supply development. The economics of conservation should also be considered. The encouragement of conservation practices beyond economically and environmentally feasible limits is questionable. Many social and institutional barriers to conservation still exist. It is often difficult to get people to accept and use the available technology. Conservation shoul be used as an option, where effective, in water supply planning but it does not eliminate the need for additional water supply development. (See also W81-00160) (Seigler-IPA)
W81-00173

HIGH PLAINS DROUGHT: LESSONS AND PLANNING,
Texas Dept. of Water Resources, Austin.
H. W. Grubb, M. L. Wright, G. W. Bomar, and C. A. Tuck.
In: Proceedings of the Conference on Water Conservation Needs and Implementing Strategies, July 9-13, 1979, Franklin Pierce College, Rindge, NH, p 218-227, 1979. 3 Tab, 6 Ref.

Descriptors: *Great Plains, *High Plains, *Droughts, Irrigation water, Planning, Forecasting, Legislation, Rain-enhancement, Water reuse, Water policy, Agriculture, Semiarid climates, Water supply, Groundwater, Water shortage.

The Great Plains Region, an area of important food grains, fiber, feed grains, and beef production, is subject to periodic extended droughts which have a major economic effect on the local, regional, and national economies. The area has extensively developed irrigation using exhaustible groundwater reserves to produce from 2.5 to 4.0 times the crop yields expected from dryland acres. This irrigation also stabilizes annual income and produces a larger supply of food and fiber materials for national and export markets. Repeated droughts in the area clearly illustrate the need for more reliable long-range weather forecasting techniques and expanded development of supplemental water supplies. More accurate forecasting is difficult due to the extreme variability in time and space of drought on the Great Plains. While conservation is frequently proposed as an alternative to development, increasing the water supply will reduce economic effects. Two potential major water supply management techniques for the area are reuse and rain-enhancement. Legislative actions have been taken to study ways of planning for supplemental water supplies. A study is now underway to: (1) protect the Nation's continued food supply, (2) promote the economic vitality of the region, and (3) evaluate alternative development strategies. 3C. Use Of Water Of Impaired Quality

AN ECONOMIC EVALUATION OF GREENBELT IRRIGATION WITH EFFULENT WATER,
California Univ., Riverside. Dept. of Botany and Plant Sciences.
W. W. Wood, V. B. Younger, G. B. Benoit, and D. R. Hurd.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-112666, Price codes: A04 in paper copy. California Water Resources Center, University of California, Davis Technical Completion Report, September 1980, 72 p, 8 Tab, 2 Append. (California Water Resources Center Project UCAL-WRC-W-532). OWRT-A-065-CAL (1).

Descriptors: *Wastewater disposal, *Effluents, *Irrigation, *Economics, *Energy, Costs, Reclaimed water, Water reuse, California, Maloney Canyon Project(CA).

Land disposal of wastewater, although not a new concept, has received widespread interest in recent years because of an increased need to conserve water and a greater public concern about water pollution. While there have been numberous recent research projects on the use of wastewater for irrigation, very few have dealt specifically with the economic aspects. The maloney Canyon Project in California has shwon that greenbelt irrigation with wastewater is feasible from the biological and physical standpoints. Based on the above project, this research attempted to quantify the specific monetary and energy costs associated with land application renovation of wastewater, and to a lesser extent consider the long-run implications. In the first half of this study the attempt was made to see whether land application compares favorably with other forms of advanced wastewater treatment. Relationships between the fundamental characteristics of plant types such as capacity, treatment unit type, capital cost, etc., were studied by using statistical analysis such as linear regression, crosstabulations, and factor analysis. The last objective of this paper was to estimate the fixed, variable, and total cost functions of applying water through greenbelt irrigation as those functions vary relative to capacity, design, and geography. (Snyder-CA).

EFFECTS OF SPRAY IRRIGATION OF MUNICIPAL WASTEWATER ON TRACE METALS IN SEVERAL CROP AND FOREST ECOSYSTEMS,
Pennsylvania State Univ., University Park. School of Forest Resources.
W. E. Sopper, and S. N. Kerr.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-114001, Price codes: A04 in paper copy, A01 in microfiche. Institute for Research on Land and Water Resources, The Pennsylvania State University, Research Project Technical Completion Report, Sept. 1980, 30 p, 15 Tab, 7 Ref. OWRT-B-083-PA (2), 14-31-0001-5109.

Descriptors: *Irrigation effects, *Municipal wastes, *Impaired water use, *Crop response, *Forestry, Water reuse, Water quality, Waste water, Soil analysis, Treated municipal waste water, Trace metals, Forest ecosystem, Tree growth, Soil samples, Vegetation samples, Foliar samples, Waste water quality, Agronomic crops.

Since 1963 secondary treated municipal wastewater has been spray-irrigated on crops and forestland at various application rates at The Pennyslvania State University. In general, results have indicated that the wastewater applications have been beneficial in terms of increasing crop yield and tree growth and that the wastewater can be satisfactorily renovated for groundwater recharge. In 1975, soil and vegetation samples were collected from all control and irrigated plots for trace metal analysis. The highest applications of wastewater was at a rate of 5 cm per week. At this rate approximately 18.8 m of wastewater were applied during the period 1963 to 1975. Soil samples were collected at the 0-5, 5-10, 10-15 and 15-30 cm depths. Foliar samples were collected from the agronomic crops and from the trees and subordinate vegetation in the forest stands in both the irrigated and control areas. Soil and vegetation samples were analyzed for copper, zinc, chromium, lead, cobalt, cadmium, and nickel. It can be concluded from the data collected that wastewater irrigation at The Pennsylvania State University Farms did not significantly increase the trace metal concentrations in the soil or vegetation after 13 years of application.

MUNICIPAL SEWAGE EFFLUENT APPLICATION TO SOILS BEARING HARDWOOD COPPICE AND LOBLOLLY PINE STANDS,
Clemson Univ., SC. Dept. of Forestry.
C. L. Lane, N. R. Page, B. R. Smith, A. T. Shearin, and R. O. Hegg.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-113987, Price codes: A02 in paper copy, A01 in microfiche. Water Resources Research Institute, Clemson University Report No 85, 1980, 17 p, 2 Fig, 5 Tab, 100 Ref. OWRT-B-096-SC (1).

Descriptors: *Sewage effluents, *Forest soils, Piedmont soils, Wastewater, Loblolly pine trees, Hardwood, Coppice, Tree growth, *Irrigation effects, *Water reuse, *Effluent renovation, Forestry, Spray irrigation.

Treated municipal sewage effluent was spray irrigated on an area adjacent to the sewage treatment plant of the Town of Clemson, SC. A hardwood coppice and a 35-year-old loblolly pine plantation were irrigated with weekly treatments for two years. These treatments were zero, 2.5 cm, 5 cm and a variable rate that during the growing season was 11.5 cm equivalent irrigation per week. Two-year biomass production on the coppice stand was proportional to treatment rates being 5030 kg/ha, 6500 kg/ha, 7700 kg/ha, and 9700 kg/ha dry weight, respectively. Height growth of the pines was 183 cm, 189 cm, 219 cm, and 261 cm. Diameter growth of the pines was one cm for all treatments. Soil analysis for fecal coliforms showed that by the time the effluent reached 45 cm, they had been effectively removed. There was no evidence of any groundwater or adjacent stream contamination at the rates applied.

THE PRODUCTION OF AGRICULTURALLY USEFUL MUTANT PLANTS WITH CHARACTERISTICS CONDUCIVE TO SALT TOLERANCE AND EFFICIENT WATER UTILIZATION,
Colorado State Univ., Fort Collins. Dept. of Botany and Plant Pathology.
M. W. Nabors.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-114712, Price codes: A05 in paper copy, A01 in microfiche. Completion Report, October 1979. 35 p, 2 Fig, 1 Tab, 22 Ref, 5 Append. Colorado Water Resources Research Institute, Colorado State University. OWRT-C-7017 (no 6232)(1), 14-34-0001-6232.

Descriptors: *Salt tolerance, *Saline soils, *Plant growth, *Greenhouses, Growth chambers, Salinity tolerance, Resistance, Salts, Sodium compounds, *Agriculture, Wheat, Corn(Field), Oats, Tobacco, Tomatoes, Vegetable crops, Cultures, Colorado.

The current estimate of $16 million for annual damage from excess salinity in the Colorado basins is expected to reach $51 million by the year 2010. Feasibility for utilizing new varieties of plants designed for compatibility with excess salinity was investigated. The report demonstrates that available tissue culture methodology can be used to rapidly select NaCl-tolerant cell lines and to regenerate whole plants from these lines. The regenerated plants were shown to be salt-tolerant in greenhouse experiments, and were found capable of passing this tolerance onto two generations of offspring. It thus appears that salt tolerance, which can be economically selected in tissue culture, is both persistent and inheritable in regenerated plants. Salt-tolerant cell lines were selected in wheat, oats, and tobacco, and salt-tolerant plants were regenerated from these three cell line species. Greenhouse testing was nearly complete for tobacco, and was underway for oats. The goal of increasing arid land food production may be best achieved by producing compatible plant varieties. In addition, considerable advancement in tissue culture methodology was achieved for sugarbeets, tomatoes, and corn, and mutation selection could begin now in tomatoes and within a year in corn and sugarbeets. THE UTILIZATION OF TREATED MUNICIPAL WASTEWATER FOR CROP PRODUCTION IN BUCKEYE, ARIZONA,
Arizona Univ., Tucson. Dept. of Plant Sciences.
J. A. McFadyen.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-115214, Price codes: A04 in paper copy, A01 in microfiche. M.S. Thesis, 1976. 44 p, 15 Tab, 35 Ref. OWRT A-050-ARIZ(3), 14-31-0001-5003.

Descriptors: *Irrigation effects, Irrigation practices, *Wastewater reuse, Municipal wastes, Water conservation, *Crop response, Water reuse, *Crop production, Arizona, Wheat, Barley, Alfalfa, Soil properties, Pump water-waste water mixture.

Production of selected crops irrigated with treated municipal wastewater and pump water mixtures and with pump water alone was investigated. Wheat and barley irrigated with wastewater-pump water mixtures produced higher grain yields than did wheat and barley irrigated only with pump water. Alfalfa hay yields were higher for fields irrigated with wastewater-pump water mixtures than for fields irrigated with pump water alone. No differences were noted between irrigation treatments for safflower seed yields or for lint cotton yields. The pump water alone irrigated fields were fertilized by grower applications and by nutrients in the irrigation water with more nitrogen but less phosphorus than the wastewater-pump water mixture irrigated fields. Soils irrigated with wastewater-pump water mixtures had higher levels of extractable phosphorus than did soils irrigated with pump water alone. Pump water had higher concentrations of soluble salts and nitrate-nitrogen than did the wastewater-pump water mixtures; however, the wastewater-pump water mixtures contained higher levels of phosphorus than did pump water. Treated municipal wastewater can be utilized effectively as a source of plant nutrients and irrigation water in the commercial production of field crops in the southwestern United States.
W81-00086

WASTEWATER HELPS THE BARLEY GROW,
Arizona Univ., Tucson. Dept. of Plant Sciences.
A. D. Day, J. A. McFadyen, T. C. Tucker, and C. B. Cluff.
Water & Wastes Engineering, August 1979, p 26-28. OWRT-A-050-ARIZ(2), 14-31-0001-5003.

Descriptors: *Irrigation effects, *Waste water, *Barley, Growth rates, Experimental farms, Grains(Crops), Arizona, Pump water-wastewater mixture, Soil properties.

Experiments were conducted in southern Arizona to investigate the effects of irrigation with pump water and a pump water-wastewater mixture on barley (Hordium vulgare L.) growth, grain yield, and grain quality; soil properties; and irrigation water quality. In 1974 and 1975, on small plot research, barley irrigated with a 50:50 mixture of pump water and wastewater significantly exceeded barley irrigated with pump water alone in plant height, number of heads per unit area, number of seeds per head, seed weight, grain yield, and straw yield. In large field studies conducted from 1970 through 1977, barley irrigated with the mixture had taller plants, more lodging, lower grain volume-weights and higher grain yields than barley irrigated with pump water alone. Soils irrigated with both types of irrigation water had similar pH. Soluble salts (ECx10(3)), exchangeable sodium percentage, nitrate-nitrogen, and extractable phosphorus were significantly higher in soils irrigated with the pump water-wastewater mixture than in soils irrigated with pump water. Water quality analyses showed that the pump water-wastewater mixture had lower total soluble salts, lower nitrate-nitrogen, and higher phosphorus levels than pump water alone.
W81-00097

COMMERCIAL PRODUCTION OF WHEAT GRAIN IRRIGATED WITH MUNICIPAL WASTE WATER AND PUMP WATER,
Arizona Univ., Tucson. Dept. of Plant Sciences.
A. D. Day, J. A. McFadyen, T. C. Tucker, and C. B. Cluff.
Journal of Environmental Quality, Vol 8, No 3, p 403-406, July-Sept. 1979. OWRT-A-050-ARIZ(1), 14-31-0001-5003.

Descriptors: *Irrigation effects, *Municipal wastes, *Waste water, *Wheat, Growth rates, Experimental farms, Grains(Crops), Arizona, Soil properties, Pump water-wastewater mixture.

Experiments were conducted in southern Arizona to study the effects of irrigating wheat (Triticum aestivum L.) with a mixture of pump water and waste water and with pump water alone on wheat growth, grain yield, grain quality, soil properties, and irrigation water quality. In small plot research, wheat irrigated with the pump water-waste water mixture produced taller plants, more heads per unit area, heavier seeds, higher grain yields and higher straw yields than did wheat grown with only pump water. When large fields were compared, wheat grown with the pump wastewater mixture had taller plants, more lodging, lower grain volume-weights, and higher grain yields than did wheat produced with pump water. The pH and exchangeable sodium of soil irrigated with pump water alone or the pump water-waste water mixture were similar. Soluble salts and nitrate-nitrogen were higher in soils irrigated with pump water than they were in soils irrigated with the pump water-waste water mixture. Extractable phosphorus was higher in soils irrigated with the pump water-waste water mixture than in soils irrigated with pump water. Total soluble salts and nitrate-nitrogen were higher in pump water than they were in the pump water-waste water mixture; however, the pump water-waste water mixture had higher levels of total nitrogen and phosphorus than did pump water. The higher grain yields obtained when wheat was irrigated with the pump water-waste water mixture than were produced when wheat was grown with pump water alone probably resulted from lower concentrations of soluble salts in the pump water-waste water mixture than were present in pump water.

HYDROGEOLOGIC DATA FOR THE MCKAY CREEK SUBSURFACE WASTE-INJECTION TEST SITE, PINELLAS COUNTY, FLORIDA,
Geological Survey, Tallahassee, FL. Water Resources Div.
J. J. Hickey.
Geological Survey Open-File Report 77-802, November 1977. 94 p, 17 Fig, 32 Tab, 18 Ref.

Descriptors: *Hydrologic data, *Injection wells, *Waste disposal wells, *Baseline studies, Water quality, Hydrologic properties, Underground storage, Effluents, Path of pollutants, Test wells, Water levels, Water analysis, Hydrogeology, Florida, Pinellas County(FL).

Lithologic, hydraulic, geophysical, and water-quality data collected at the McKay Creek subsurface waste-injection test site in Pinellas County, Florida, are reported. Data were collected to determine the possibility of subsurface injection of waste-treatment plant effluent. One exploratory hole, one test injection well, and eight observation wells were constructed between May 1973 and February 1976. The exploratory hole was drilled to a depth of 1,750 feet below land surface; the test injection well is open in dolomite between 952 and 1,040 feet; and the observation wells are open to intervals above, in, and below the test injection zone. The lithology of the upper 100 feet is predominantly clay. From 100 to 1,750 feet below land surface, limestone and dolomite predominate. Gypsum is present 1,210 feet below land surface. Laboratory analyses of cores taken during drilling are given for vertical intrinsic permeability, porosity, interval transit time, and compressibility. Specific capacities tested during drilling range from 4 to 2,500 gallons per minute per foot of drawdown. An 83-hour withdrawal test at 4,180 gallons per minute and a 2-month injection test at 650 gallons per minute were run. Small water-quality changes were observed in one observation well immediately above the test injection zone during and after the injection test. Formation water in all of the wells with the exception of the shallowest observation wells is saline. The vertical position of saltwater is estimated to be at about 280 feet below land surface. Thirteen wells within a 1-mile radius of the test site were located and sampled for water quality. (USGS)

3D. Conservation In Domestic and Municipal Use

PROCEEDINGS OF THE CONFERENCE ON WATER CONSERVATION NEEDS AND IMPLEMENTING STRATEGIES,
Conference held July 9-13, 1979, at Franklin Pierce College, Rindge, NH, American Society of Civil Engineers, New York, NY, 1979. 276p

Descriptors: *Droughts, *Planning, Water shortage, Water policy, Risks, Water demand, Water supply, Mathematical models, Streamflow forecasting, Reservoirs, California, Water rates, Legislation, Water management(Applied), Hydrology, Urbanization.

Twenty-nine papers discussing the evidence available to recommend water conservation and to identify the studies still needed were presented by scientists and engineers at the conference. Three major facets of water conservation discussed were: (1) the role and degree of effectiveness of legislative, administrative, legal, and political science forces; (2) the technical, engineering, and scientific methods available; and (3) the financial and economic means available to influence water conservation. The conferene concluded that President Carter's basic policy on water conservation is theoretically sound, however, several of its components need clarification. Legislative and executive action should be designed to assure that conservation is one of several alternatives considered and it should not discourage structural approaches when they are the most efficient alternative. No nationally applicable statement can be made about the technical effectiveness and impact of water conservation measures. Individual site-specific studies will be needed to draw effectiveness conclusions. Also, conservation measures, while saving water, may not be cost effective depending on the specific situation. Allocation of the costs of water conservation among beneficiaries will be necessary as conservation for conservation's sake could have serious economic consequences. (See W81-00161 thru W81-00189). WATER CONSERVATION: THE FEDERAL VIEWPOINT,
Water Resources Council, Washington, DC.
L. M. Eisel.
In: Proceedings of the Conference on Water Conservation Needs and Implementing Strategies, July 9-13, 1979. Franklin Pierce College, Rindge, NH, p 22-27, 1979.

Descriptors: *Water conservation, *Water policy, *Federal government, *Planning, Legislation, Water resources development, Water supply, Environmental effects, Federal-State water rights conflicts, Water rights, Grants, Government finance, Water costs, Water demand, Programs.

Water conservation is the cornerstone of President Carter's National Water Policy, however, the national role in water conservation will be cooperation, not preemption of local and State authority The National Water Policy also calls for improved planning and management of Federal water resources programs and increased attention to environmental quality. To implement the objectives of the policy, 13 directives were issued to various responsible Federal agencies. Specific tasks were assigned and each agency is required to seek input from State, county, local, and non-governmental agencies in the development of implementation plans. Nineteen task forces are at work implementing the directives in areas such as floodplain management, Soil Conservation Service programs, Federal water pricing, technical assistance, loan and grant programs, agricultural assistance, nonstructural flood protection, and Federal and Indian reserved water rights. Up-to-date summaries of agency actions can be found in the 'Final Summary Report' of Water Conservation Task Force 6A. Funding to assist states with water conservation will be available when the Water Conservation Technical Assistance Grants Program is authorized. It will provide matching funds for education

and information dissemination, technical assistance, and water exchanges. It is the national viewpoint that there is no national water crisis -- and, with emphasis on conservation, there will not be a crisis. (See also W81-00160) (Seigler-IPA)

URBAN WATER BALANCES CONSIDERING CONSERVATION,
American Society of Civil Engineers, Marblehead, MA. Urban Water Resources Research Program.
M. B. McPherson.
In: Proceedings of the Conference on Water Conservation Needs and Implementing Strategies, July 9-13, 1979. Franklin Pierce College, Rindge, NH, p 28-36, 1979. 2 Fig, 22 Ref.

Descriptors: *Water conservation, *Urban hydrology, *Water sources, Urbanization, City planning, Potable water, Input-output analysis, Industrial water, Domestic water, Water supply, Water allocation(Policy), Water loss, Water users, Water utilization.

A graphical representation of water quantities in a hypothetical urban area of one-million inhabitants is used along with a composite public water/waste water input - output balance to illustrate the major factors in water conservation for urban areas. Although such water balance inventories describing the quantity and quality aspects of water are advocated as a referencing tool for planning in metropolitan areas, very few have been developed. In accounting for water quantities two major factors are: (1) the bulk of supplied water originates outside of urban area; and (2) over half of all water is in private hands. Public water supply withdrawals are a relatively small fraction of total metropolitan withdrawals, and domestic use represents a modest fraction of these public water withdrawals. Due to these proportions and ambiguities in the amount of 'unaccounted-for' water in a system, any savings in domestic use through conservation would be difficult to prove. 'Dual' community water distribution systems represent an area of likely conservation since only a small fraction of public water supplies needs to be of 'drinking water' quality. Other major areas for conservation are the reduction of leakage and the reduction of peak rate usage. A long-term important national water development is the greater appreciation of the complex interconnections, interactions, and interrelations among the numerous facets of water in the urban environment. LOCAL DROUGHT-INDUCED CONSERVATION CALIFORNIA EXPERIENCES,
California State Dept. of Water Resources, Sacramento.
G. H. Meral.
In: Proceedings of the Conference on Water Conservation Needs and Implementing Strategies, July 9-13, 1979, Franklin Pierce College, Rindge, NH, p 37-46, 1979. 1 Fig, 3 Tab.

Descriptors: *California, *Water conservation, *Drought tolerance, Water utilization, Agriculture, Irrigation water, Water reuse, Water policy, Brackish water, Droughts, Water shortage, Water users, Water demand, Water supply.

Following the positive public response to the need for water conservation in California during the drought of 1976-77 an extensive program of planning for future water conservation is being developed. As public awareness of the drought severity developed in 1977, customers in the Marin Municipal Water District decreased their consumption by 64%, 7% more than the mandated 57% reduction. Two major drought measures used were the increased use of reclaimed water, especially for irrigation, and the construction of a temporary pipeline from the East Bay across the Richmond-San Rafael Bridge. A comparison of 1977 and 1979 water usage shows that water conservation practices are persisting although not at the peak drought level. Permanent conservation measures include low-flush toilets and low flow showers and lavatory faucets. A benefit to cost ratio of about five to one was found for implementing conservation equipment. A 15% reduction in demand through conservation is the goal of the State Water Project in Southern California by the year 2000. With cooperation the amount of water used for urban landscape irrigation could be reduced by 1.4 cubic hectometers in the same period. Conservation in agriculture, the largest single water user in California, will involve the increased use of drip irrigation, the use of brackish water for irrigation, and the development of salt-tolerant crops. Water conservation must be a tool for day-to-day operations as well as long-term drought planning. (See also W81-00160) (Seigler-IPA)

WATER CONSERVATION IN NORTHEASTERN ILLINOIS,
Illinois State Dept. of Transportation, Chicago. Div. of Water Resources.
F. L. Kudrna, and D. Injerd.
In: Proceedings of the Conference on Water Conservation Needs and Implementing Strategies, July 9-13, 1979. Franklin Pierce College, Rindge, NH. p 47-57, 1979. 7 Ref.

Descriptors: *Illinois, *Water conservation, *Lake Michigan, Water policy, Plannin, Water supply, Water utilization, City planning, Water reuse, Water shortage, Water rates, Humid areas, Wet climates, Water demand.

Water conservation is becoming accepted practice in Northeastern Illinois despite the apparently ample supply of water from Lake Michigan and an annual precipitation average of 33 inches. Litigation limits the amount of water that Illinois can divert from Lake Michigan to 3,200 cfs and other water supply sources in the area are hydrologically limited, thus conservation is a necessity. Three major points in the area's conservation program are: (1) to reduce the amount of lake water required for operation of the Sanitary and Ship Canal; (2) to reduce the water lost through leakage at lakefront controlling works; and (3) to require all entities receiving lake water to implement water conservation techniques. Various water conservation techniques appropriate for Northeastern Illinois include water conservation ordinances, outside water use controls, retrofitting, adjusting water rate structures, water conservation education, industrial water reuse, and low consumption appliances. Steps are also being taken to ensure efficient water systems management. It is difficult to quantify the effects of water conservation techniques and reductions in Illinois will seem minor compared with drought stricken areas like California, but the steps taken here are important in the establishment of a water resource balance for the area. W81-00164

THE ECONOMICS OF WATER CONSERVATION,
California Univ., Santa Barbara.
W. D. Morgan.
In: Proceedings of the Conference on Water Conservation Needs and Implementing Strategies, July 93-13, 1979, Franklin Pierce College, Rindge, NH, p 59-68, 1979, 2 Fig, 27 Ref.

Descriptors: *Water conservation, *Economics, *Evaluation, *Cost-benefit analysis, Alternative costs, Water demand, Prices, Water supply, Mathematical models, Input-Output analysis, Forecasting, Water costs, Planning, Water allocation, Water rates.

It is the view of economists that financial incentives are an integral part of determining water use and therefore are an integral factor in water conservation. Economists consider water to be a 'good' and, if provided full information, consumers will choose the correct amount for them given their income or output. Water is scarce, which makes it an economic good, it has declining marginal value, and it is divisible and can be allocated over time and space. A demand curve can be used to show internal information about water supply and demand for a given unit such as a household or industrial firm. A demand curve shows the quantity of water needed at all alternative prices while holding all other influencing factors constant. A framework for the allocation of water is developed using the constraints of supply and demand while considering factors such as specific user group pricing, prices different from marginal costs, seasonal or peak load pricing, and price flexibility. It is important that water purveyors get rid of all subsidies and begin to calculate the real resource cost of the water they supply. Demand management is needed to develop rate structure related to marginal cost pricing. Information must be provided so users can conserve by making wise economic short-run and long-run decisions. W81-00165

WATER CONSERVATION IN HOUSING,
Department of Housing and Urban Development, Washington, DC.
J. C. Hancock.
In: Proceedings of the Conference on Water Conservation Needs and Implementing Strategies, July 9-13, 1979, Franklin Pierce College, Rindge, NH, p 69-73, 1979.

Descriptors: *Water conservation, *Water policy, *Federal government, *Domestic water, Water costs, Water supply, Water loss, Leakage, Water users, Water shortage, Regulation, Building codes, Legislation.

The draft report of Task Force No 9 of the President's Water Policy Initiatives on 'Water Conservation in Housing Assistance Programs' is summarized. Residential water conservation is to be accomplished at minimal cost and without reducing the quality of life of affected users. The Task Force found that it may be possible to reduce the current 70 gallons per person daily water consumption by as much as 15% within 10 years. Although residential consumption is only a small part of total consumption a visible water conservation effort in housing is essential if a water conservation ethic is to become part of the American way of life. Eight actions are recommended for early implementation including limited flow showerheads, flow aerators on faucets, water leakage surveys, metering of all water distribution pipes, and the modification of government standards. Twenty-two items needing short term research are listed along with fourteen that need long term research for proper evaluation. General factors affecting residential water use conservation that are interrelated with other water conservation considerations include the establishment of a general conservation ethic, land subsidence, domestic water use costs, leakage, and sewage plant operations. W81-00166

WATER CONSERVATION IN FEDERAL PROGRAMS,
Office of Water Research and Technology, Washington, DC.
G. D. Cobb.
In: Proceedings of the Conference on Water Conservation Needs and Implementing Strategies, July 9-13, 1979, Franklin Pierce College, Rindge, NH, p 74-79, 1979.

Descriptors: *Water conservation, *Water policy, *Federal government, *Programs, Planning, Legislation, Water resources development, Water shortage, Water supply, Federal-State water rights conflicts, Government finance, Federal project policy, Administrative agencies, Water law, Water utilization.

President Carter's water policy statement and first 13 initiatives are designed to make certain that there is enough water of the right quality to meet all of the needs of the American people by placing emphasis on water conservation. Water conservation is defined in many ways such as wise water management or saving water at one place and time to make it available for more beneficial uses. In the past, Federal programs have often been too late, scattered, and uncoordinated. To change this the President has required that all Federal water programs be reassessed, reviewed, and examined for water conservation opportunities. Nineteen Task

Forces are conducting this coordinated analysis of Federal programs and water policy. A Water Policy Coordination Group keeps the Task Forces on schedule and on track. Task Force 6A has compiled a preliminary report of information and recommendations from 87 Federal prograns. A matrix was developed to rank the recommendations for the 87 programs. Reclamation rehabilitation was ranked number 1, waste treatment management was ranked number 3, and water resources research was ranked number 14. This effort begun by Task Force 6A must be continued and expanded if water management is to make full use of Federal programs. (See also W81-00160) (Seigler-IPA)
W81-00167

WATER CONSERVATION IN U. S. ARMY CORPS OF ENGINEERS PROGRAMS,
Corps of Engineers, Washington, DC. Office of Policy.
D. B. Duncan.
In: Proceedings of the Conference on Water Conservation Needs and Implementing Strategies, July 9-13, 1979, Franklin Pierce College, Rindge, NH, p 80-82, 1979.

Descriptors: *Water conservation, *Water policy, *Federal government, *Corps of Engineers, Water resources development, Reservoirs, Water loss, Environmental effects, Water supply, Planning, Water utilization, Project planning, Project benefits, Alternate planning, Programs.

The Corps of Engineers defines water conservation as any beneficial reduction in water use or in water losses. From this, water management practices constitute conservation only when their purpose is to conserve a given supply of water through reduction in water use (or loss) and when their total national economic and environmental benefits outweigh their costs in these areas. The Corps of Engineers must apply sound conservation principles in the use of water by the agency, and water conservation must become a basic factor in planning to satisfy future water supply needs. To implement water conservation the Civil Works program has five functional areas: planning, design and construction, reservoir regulation, operation and maintenance, and regulatory activities. Planning represents the area with the greatest potential for conservation. Policy studies are currently underway to meet planning needs. Design and construction activities for conservation will be site specific and careful conservation reviews will be conducted during the stages of preauthorization, postauthorization planning, and design. Guidelines have been issued by the Chief of Engineers to improve water management at existing reservoir projects. In the future an evaluation process will be developed to permit a consistent trade-off between water conservation practices and increments of additional water supply. W81-00168

WATER SUPPLY SYSTEM FAILURES WITH CONSERVATION,
Camp, Dresser and McKee, Inc., Atlanta, GA. Water Resources Div.
G. S. Nicolson.
In: Proceedings of the Conference on Water Conservation Needs and Implementing Strategies, July 9-13, 1979, Franklin Pierce College, Rindge, NH, p 94-102, 1979. 8 Fig, 2 Tab, 2 Ref.

Descriptors: *Water conservation, *Computer models, *Mathematical models, *Droughts, *Forecasting, Reservoirs, Streamflow forecasting, River forecasting, Statistical methods, Water demand, Water shortage, Probability, Synthetic hydrology, Statistical models.

A computer model that smulates streamflow and reservoir operation of an existing water supply reservoir system was used to forecast annual reservoir failures with two sets of demands and situations. The model uses both the historic record and a synthetic record. Water demand from the reservoir is increasing 1 to 2% annually with current withdrawals already exceeding the long-term safe yield. Should the above average rainfall trend of recent years end, or should a drought occur, water conservation measures will have to be taken to reduce demand. The computer model was used to analyze the results of such conservation measures during forecasted droughts. A streamflow model that preserves monthly means, standard deviations, serial correlation coefficient, and skew coefficient was used to generate the one hundred years synthetic record. Demand estimated from the historic record is less than that from the synthetic record for curves of equal probability of failure. A forecasting procedure was used to determine when the water demand should be reduced by conservation. The two simulations run had average demands of 0.85MAF and 0.79MAF. Failure probabilities of more than 20% and 10%, respectively, were found. Results show that for this reservoir system, forecasting and conservation have more impact on reducing failures when the probability of failure is high than when it is low. WATER CONSERVATION NEEDS AND APPROACHES IN HUMID AREAS,
North Carolina Water Resources Research Inst., Raleigh.
J. M. Stewart.
In: Proceedings of the Conference on Water Conservation Needs and Implementing Strategies, July 9-13, 1979, Franklin Pierce College, Rindge, NH, p 130-136, 1979. 3 Fig, 1 Tab, 3 Ref

Descriptors: *North Carolina, *Water conservation, *Water policy, *Virginia, Water users, Water demand, Water costs, Industrial water, Humid areas, Wet climates, Water rates, Forecasting, Urbanization.

Despite being a humid water-rich State, North Carolina does have water use problems and conservation steps are being taken. Conservation measures can: (1) reduce treatment and construction costs; (2) reduce energy costs; (3) extend the use of high quality water sources; (4) extend the life of existing facilities; (5) reduce environmental impacts; and (6) improve on-site facility performance with decreased flows. North Carolina has disparities in geographic patterns of water availability and population distribution. Large urban areas are located on divides or on river headwaters. Also, the State has many high water consumption industries. Water use continues to increase annually with 1975 figures showing per capita water use at over 1,200 gallons per day. Water uses are expected to double in the next 40 years. Water conservation is being encouraged by the Environmental Management Commission. A bonus priority system for State grants was established to give priority to applicants who practice water conservation methods. The Atlanta Regional Commission has also adopted specific policies to promote water conservation. In Virginia, the Fairfax County Water Authority has developed a rating schedule to promote conservation and equality by assessing an excess usage charge to customers who use 1.3 times their winter consumption in the summer. HUD/NBS RESIDENTIAL WATER CONSERVATION PROGRAM,
National Bureau of Standards, Washington, DC.
L. S. Galowin.
In: Proceedings of the Conference on Water Conservation Needs and Implementing Strategies, July 9-13, 1979, Franklin Pierce College, Rindge, NH, p 137-138, 1979.

Descriptors: *Water conservation, *Potable water, *Laboratory tests, Water policy, Cost-benefit analysis, Design criteria, Building codes, Design standards, Specifications, Drainage systems, Plumbing, Pipes, Water demand.

Multi-year laboratory research investigations are being conducted by the National Bureau of Standards to develop standards for water conserving potable water systems in buildings. Included in the research are the total building plumbing system, water supply distribution, fixtures, waste drainage branches, and other treatment facilities. The research is designed to establish: (1) test methods for buildings; (2) guidelines of performance for plumbing codes; (3) Minimum Property Specification water reduction provisions; (4) acceptance factors throgh human factors research; and (5) economic evaluation procedures. The research is categorized into the following areas: water efficient fixtures technology; demand for water; efficiency of drainage systems; drainage, waste, vent systems; and usage and acceptability factors. These categories are briefly described. (See also W81-00160) (Seigler-IPA)

NORTHERN CALIFORNIA RATIONING LESSONS,
North Marin County Water District, Novato, CA.
J. O. Nelson.
In: Proceedings of the Conference on Water Conservation Needs and Implementing Strategies, July 9-13, 1979, Franklin Pierce College, Rindge, NH, p 139-146, 1979. 2 Fig, 2 Ref.

Descriptors: *California, *Water conservation, *Rationing(Water), *Water shortage, Droughts, Water supply, Irrigation water, Industrial water, Plumbing, Water management(Applied), Regulation, Water rates, Arid lands.

Evidence collected in connection with the California drought indicates that in a similar area, given a serious water shortage and adequate communication with the consumers, a reduction in water use of between 25 and 40% can be achieved when an emergency rationing plan for residential water consumption is implemented. Under these conditions reductions in commercial consumption of up to 25% are also possible. Rationing involves critical allocation decisions so that the least harm possible will result. In nearly every instance where mandatory rationing was implemented in California, Consumers cut water usage even more than requested. Communication is the key to rationing so that the consumer makes a voluntary commitment. Four distinct rationing forms were used: (1) percentage reduction (compared to normal use in a similar billing period); (2) seasonal allotment (a per capita or per home allotment -- increased in summer and decreased in winter); (3) fixed allotment (per capita or home allotment based on calculated need); and (4) sprinkler ban. Overall it was concluded that under drought conditions rate penalties for exceeding allotments were not needed Most programs provide for service shut off in the event of repeated violations. The total sprinkler ban was found to be the least successful method. (See also W81-00160) (Seigler-IPA)

DENVER -- IMPORT AND REUSE CONSERVATION LESSONS,
Denver Water Dept., CO.
R. D. Wiley
In: Proceedings of the Conference on Water Conservation Needs and Implementing Strategies, July 9-13, 1979, Franklin Pierce College, Rindge, NH, p 165-173, 1979. 5 Fig, 4 Ref.

Descriptors: *Water conservation, *Colorado, *Denver, *Colorado River, Water supply, Water utilization, Water demand, Successive use, Environmental effects, Planning, Water resources development, City planning, Urbanization, Semiarid climates.

The Denver Water Department which provides treated water service to over 900,000 people is having to make hard decisions concerning the realities of conservation versus the expense and environmental unpopularity of further development of Colorado River waters. Denver, located on a semiarid plain, has an average rainfall of only 15 inches. Approximately 70% of Colorado's surface water flows away from Denver down the sparcely populated Western Slope of the Continental Divide The South Platte River, which flows past Denver, collects only 10% of the State's water. At present Denver gets 60% of its water supply by diverting water flow from the Western Slope. There is much

negative sentiment concerning future increases in diversion from the Western Slope and the Colorado River. One conservation measure being conducted is successive use or reuse. A one million gallon-per-day reuse demonstration plant is being designed for future construction. A full-scale reuse program could be implemented by about the year 2000 if the demonstration plant is successful. Even with conservation and successive use the demand for water will exceed supply sometime around the turn of the century. Also, if water rights to Western Slope water are not utilized they will be lost to downstream urban areas. (See also W81-00160) (Seigler-IPA)

CONSERVATION BETWEEN AND BEYOND DROUGHTS,
Bureau of Land Management, Washington, DC.
J. E. Sabadell.
In: Proceedings of the Conference on Water Conservation Needs and Implementing Strategies, July 9-13, 1979, Franklin Pierce College, Rindge, NH, p 196-201, 1979. 3 Fig, 1 Tab.

Descriptors: *Droughts, *Water conservation, *California, Planning, Industrial water, Agriculture, Water resources deve lopment, Social aspects, Water utilization, Urbanization, Domestic water, Political aspects, Environmental effects.

The California drought of 1976-1977 demonstrated that water conservation can be quite successful in urban areas. The highest reductions were achieved in the residential sector, however, consumers are slowly returning to pre-drought consumption behavior. Residential water consumption is returning to normal more slowly than consumption in commercial, industrial, and agricultural activities. Even at the height of the drought, the agricultural sector reacted mainly to economic pressures for water conservation. Four conclusions drawn from these facts are: (1) the inevitability of droughts should be recognized and should be an integral part of planning; (2) the manipulation of nature conditions is limited by ecological impacts, and by economic, social, and political factors; (3) many systems are operating at their carrying capacity and have no resilience; and (4) there is too little concern about future droughts once a crisis period has passed. The Bureau of Reclamation has identified a priority list of actual and future water problems for the 11 Western States. Problems on the list include water for energy resources development, water for Indians, Colorado River water supply and salinity, water conservation and reuse, protection of estuaries, and preservation versus development. EFFECTS OF CONSERVATION MEASURES ON WATER DEMANDS,
Camp, Dresser and McKee Inc., Springfield, VA.
R. S. Taylor.
In: Proceedings of the Conference on Water Conservation Needs and Implementing Strategies, July 9-13, 1979, Franklin Pierce College, Rindge, NH, p 202-203, 1979.

Descriptors: *Washington(DC), *Water conservation, *Urbanization, Water shortage, Droughts, Domestic water, Social aspects, Economic analysis, Water utilization, Forecasting, Mathematical models, Regression analysis, Planning.

An evaluation of the impacts of different levels of water shortages on different classes of users and the ability of conservation to minimize these shortages was conducted for the Metropolitan Washington Area (MWA) by the Baltimore District, Corps of Engineers. This evaluation is briefly summarized. Eight subregional areas were identified to simplify the evaluation. Water use in the MWA is 66% residential, 11% commercial/industrial, and 14% governmental. Due to the high percentage of residential use, any program of water conservation must involve residential users at a high level of participation. Several alternative conservation 'scenarios' were developed with future water demands to demonstrate the relative effectiveness of conservation techniques. The methodology used for these projections involved current water use levels, projected population, employment, and housing. Water demand is estimated in each of the five major user categories from 1980 to 2030 in 10-year increments. Short-term responses to an expected water shortage in the MWA were also developed and economic losses and social impacts are analyzed. (See also W81-00160) (Seigler-IPA)

THE FEDERAL OVERVIEWER -- BUREAU OF WATER CONSERVATION,
Texas Tech Univ., Lubbock. Water Resources Center.
R. M. Sweazy.
In: Proceedings of the Conference on Water Conservation Needs and Implementing Strategies, July 9-13, 1979, Franklin Pierce College, Rindge, NH, p 245-250, 1979.

Descriptors: *Federal Government, *Water conservation, *Water policy, Planning, Legislation, Water resources development, Federal-State water rights conflicts, Government finance, Water rights, Water demand, Water supply, Cost-benefit analysis, Environmental effects, Decision making.

Water conservation when properly implemented is highly desirable, however, a new or modified Federal Government bureau to prepare and enforce detailed universally-applicable regulations is not desirable. If there is to be a defined Federal policy it should include consideration of the supply and demand and both should be subjected to cost-benefit analyses. In general the existing Federal agencies such as the Corps of Engineers, the Bureau of Reclamation, and the Soil Conservation Service have done a good job and are adequate to handle future water policy objectives. States should set their own water policy with as little Federal encroachment as possible. Any Federal Government water conservation policy should have as its cornerstone a sound recognition of State priority in water management. The Federal Government can aid states by providing incentives to sound conservation and eliminating disincentives. Federally financed projects should set prices to discourage the excessive use of water. It is also possible that through the Water Resources Council the Federal Government could provide an information and assistance clearinghouse to promote water conservation. 3E. Conservation In Industry

LOW-COST EVAPORATION CONTROL USING WAX IMPREGNATED FOAM,
Arizona Univ., Tucson. Water Resources Research Inst.
C. B. Cluff, L. Onyskow, F. Putman, S. Chesser, and D. Powelson.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-116832, Price codes: A03 in paper copy, A01 in microfiche. Project Completion Report, September, 1980. 28 p, 11 Fig, 7 Tab, 11 Ref. OWRT-A-091-ARIZ(1), 14-34-0001-8003.

Descriptors: *Evaporation control, *Reservoir evaporation, *Water conservation, *Floats, *Plastics, Water proofing, Concretes, Joints(Connections), Design, Engineering structures, Engineering, Equipment, Evaporation, Alcohols, Thin films, Floating, Polymers, Research and development, Reservoirs, Water management(Applied), Water loss, Water quality, Moisture proofing, Coatings.

A one-year study was conducted on the development of improved methods of water evaporation control using wax impregnated foam. Expanded polystyrene (EP) foam and 140 degrees F melting paraffin were used. A pressure chamber was used to wax impregnate EP sheets. Laboratory tests led to modification of the pressure chamber into a vacuum chamber, but problems arose in impregnating the interior of the sheets using a vacuum. The pressure model, however, was successfully used to impregnate up to 3-inch thick sheets of EP. It was also observed that the paraffin-impregnated rafts worked very well until temperatures above 100 degrees F were encountered under dusty conditions. Such high temperatures caused the waxed surface to become tacky, and the dust darkened the otherwise white surface, which in turn captured more heat and then more dust. Higher melting point waxes were studied to reduce the accelerated weathering noted at high temperatures, but no satisfactory combinations were found. Use of a high melting (near 190 degrees) polyethylene copolymer wax was too viscous for impregnation, but provided a hard surface coating when previously wax impregnated EP sheets were dipped into the molten polyethylene wax. Development study on wax impregnated lightweight concrete rafts, and connecting rafts with sheet metal strips bonded to EP, was also reported. (Zielinski-IPA)

ULTRAFILTRATION SYSTEM PAYS FOR ITSELF,
Abcor, Inc., Wilmington, MA.
S. Pinto, and L. Gould.
Industrial Wastes, Vol 26, No 5, p 16-18, September/October, 1980. 3 Fig, 1 Tab.

Descriptors: *Filtration, *Semipermeable membranes, *Cleaning, *Metals, *Alkaline cleaner baths, Industrial plants, Costs, Water pollution, Industrial wastes, Waste treatment, Conservation.

An ultrafiltration system in an alkaline cleaner bath used for metal pretreatment is described. Ultrafiltration is a pressure-driven process for separating high-molecular-weight solutes or colloids from water solutions using a semipermeable membrane. The use of such a system reduces chemical costs by increasing bath life and reducing dumping frequency, improves parts cleaning by removing soil from the bath, reduces cleaner bath maintenance, and reduces pollution caused by cleaner bath disposal. The purpose of the system is to remove oil and solids from the bath. The ultrafilter serves as a 'kidney' on the alkaline cleaner bath. The system consists of a processing tank, ultrafiltration membranes, heat exchanger, and washing tank. Solid cleaner feed feeds through the system, continuously recycling through the membrane tubes and returning to the process tank. The maximum length of the ultrafiltration process cycle is related to tank size, permeation rates, and cleaner soil content, which will differ for each system. (Baker-FRC)

3F. Conservation In Agriculture

INCENTIVES FOR AGRICULTURAL WATER CONSERVATION,
Sonnen (M. B.) Co., Inc., Walnut Creek, CA.
M. B. Sonnen, B. B. Dendy, and K. P. Lindstrom.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-109787, Price codes: A06 in paper copy, A01 in microfiche. Report prepared for Office of Water Research and Technology, July 1980, 108 p, 3 Fig, 13 Tab, 44 Ref, Append. OWRT-C-90134-C(No 9428)(1), 14-34-0001-9428.

Descriptors: *Water conservation, *Irrigation, *Water resources development, *Water management, Agriculture, Ground water, Droughts, Planning, Competing uses, * Legal aspects, Economics, Surface waters, California, Texas, Water policy, *El Paso, *San Joaquin Valley, *Sacramento River Valley, Western U.S. water supplies, Water conservation methods, Economic incentives.

Four water districts and thirteen individual farmers were interviewed about their current water conservation methods and possible incentives that might be instituted to encourage still further water sav-

ings. Interviewees farmed in central California and west Texas, and all were using both Federally supplied surface water and local ground water. These farmers were all using several methods of conservation. Tail-water return systems and laser-controlled land leveling were the most prevalent. Farmers agreed that conservation is feasible to a point; it is done in reaction to economic forces; and it will eventually have to be supplemented with additional water supply developments. One of many conclusions drawn was that water conservation as one element in overall water management planning policy could be defended and was worthwhile, whereas a policy of having water conservation take the place of needed additional water development projects could not be sustained. Additionally, water savings among western U.S. irrigators through conservation could not be relied upon to reduce total water withdrawals over current amounts by more than roughly 15%, because western farmers have been using water sparingly for many years.

ECONOMIC POTENTIALS FOR AGRICULTURAL WATER-SAVING USING ALTERNATIVE IRRIGATION TECHNIQUES,
California Univ., Riverside. Dept. of Soil and Environmental Sciences.
H. J. Vaux, Jr., and A. W. Marsh.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-112732, Price codes: A03 in paper copy. California Water Resources Center, University of California, Davis Technical Completion Report, September 1980, 43 p, 2 Tab, 1 Appen. (California Water Resources Center Project UCAL-WRC-W-553). OWRT-A-072-CAL (1).

Descriptors: *Irrigation efficiency, *Irrigation practices, *Irrigation systems, *Economic efficiency, Energy, Linear programming, Pumping, Stress, Agriculture, Adoption of practices, Model studies, *California.

More efficient use of water used by irrigated agriculture in California will likely be necessary if the significant economic role played by this industry is to be maintained in the future. Necessary economic data and methodologies are developed to assess the extent to which water savings can be realized through widespread adoption of water-saving irrigation technologies. Special emphasis is placed on identifying the extent to which water saving irrigation technologies substitute energy for water. An assessment of the methods developed was performed on the agricultural sector of western Riverside county of southern California. A linear program model develops the responses of agricultrual production to changes in the cost and availability of irrigation water and pumping energy. A new method for limiting cropping pattern shifts is analyzed. The results of the model and the possible impact of the model's assumptions on these results are discussed. Some conclusions drawn from the analysis include: an increasing rate of decline in irrigated acreage, particularly of field crops, due to increasing resource prices; a much higher eleasticity of demand for imported water than for ground water; increasing use of sprinkler and particularly drip irrigation as water price rises; and a large potential for water stressing of crops if better information becomes available on water production functions. Implications of the results are discussed and ways of improving the accuracy of the model are suggested. (Snyder - Calif)

IMPACT OF ALTERNATIVE ENERGY PRICES, TENURE ARRANGEMENTS & IRRIGATION TECHNOLOGIES ON A TYPICAL TEXAS HIGH PLAINS FARM,
Texas A and M Univ., College Station. Dept. of Agricultural Economics and Rural Sociology.
J. A. Petty, R. D. Lacewell, D. C. Hardin, and R. E. Whitson.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-112674, Price codes: A13 in paper copy. Texas Water Resources Institute, Texas A & M University Technical Report No 106, May 1980. 269 p, 32 Tab, 20 Fig, 79 Ref, 4 Append. OWRT-A-045-TEX (1), 14-34-0001-9046 & 0146.

Descriptors: *Irrigation, *Crop production, *Irrigation wells, *Costs, *Irrigation operation and maintenance, Pumping, Irrigation efficiency, Technology, Irrigation fuel, *Texas High Plains.

Irrigation is a major contributing factor in crop production on the Texas High Plains. A recursive linear programming model for a typical Texas High Plains irrigated farm was developed to evaluate expected impact of price changes, tenure and new technology. Model results indicate that irrigation would be terminated when the price of natural gas reached about $7.00 per mcf. Annual returns (above variable and fixed costs) were reduced by about as much as 30%, and the present value of returns to water was reduced by as much as 80% as the natural gas price was increased annually by $0.25 per mcf (from $1.50 per mcf). The economic life of deep groundwater was shortened by as much as 18 years. Renter-operators are even more vulnerable to rising natural gas prices than are owner-operators. Substantial economic gains appear feasible through improved pump efficiency. Results indicate that irrigation can be extended by 11 or more years with 50% improved distribution efficiency. In addition, the increase in present value of groundwater on the 1.69 million irrigated acres of the Texas High Plains was estimated to be $995 million with 50% improved efficiency.

AN ANALYSIS OF THE PLANT SOIL CONTINUUM USING ELECTROPHYTOGRAMS,
Arizona Univ., Tucson. Dept. of Electrical Engineering.
W. Gensler.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-116824, Price codes: A05 in paper copy, A01 in microfiche. Project Completion Report, September 1980. 76 p, 27 Fig, 7 Tab, 7 Ref, 1 Append. OWRT-B-061-ARIZ(1), 14-34-001-858.

Descriptors: *Electrodes, *Electrical conductance, *Soil moisture, Irrigation practices, *Irrigation efficiency, *Cotton, *Pecans, Electrical properties, Conductivity, Soil physical properties, Soil water, Moisture content, Moisture availability, Soil moisture meters, Irrigation water, Irrigation programs, Water utilization, Water supply, Water conservation, Water control, Irrigation systems, Crops, Analysis, Analytical techniques.

While visual observation is the most widely employed method of deciding when to irrigate, there is a definite need for development of a meaningful and reliable instrumentation system to obtain background data for water application decisions. Direct electrical measurement by the electrophytogram technique was early reported to provide a relation between plant water status and electropotential activity. The basic objective of this study was to quantify this relation such that irrigation schedules could be predicted. A remote sensing capability was established to determine the relation between agricultural water usage and plant electropotentials at two commercial farming sites and an experimental university site in southern Arizona, with plant electropotential activity monitored during successive irrigation cycles in cotton and pecans. These plants were found to have a definite electrical response to changes in water status. A quantitative relation to predict irrigation schedules is presently being developed with these data. Systemic plant electropotential responses were also observed, indicating the existence of a regulatory physiological mechanism over widely separated parts of the plant. Further, fruition of the cotton boll was related to the electropotential response over the long term, suggesting use of electropotential data to predict harvest timing. (Zielinski-IPA)

HYDROLOGY AND POLITICAL INFLUENCES ON WATER SUPPLY,
Harza Engineering Co., Chicago, IL.
J. E. Priest.
In: Proceedings of the Conference on Water Conservation Needs and Implementing Strategies, July 9-13, 1979, Franklin Pierce College, Rindge, NH, p 83-87, 1979.

Descriptors: *Political aspects, *Water conservation, *Hydrologic aspects, *Urban hydrology, Watersheds(Basins), Lake Michigan, Illinois, Runoff, Recharge, Groundwater, Water measurement, Water allocation policy, Decision making, Indus Basin System.

Three representative programs are discussed to show that while hydrologic analyses are imprecise and generate controversy and conflict, they do aid in the implementation of needed water supply and conservation measures. Factors to be considered in dealing with the hydrology of an allocation system include measuring the supply, identifying a base

period for supply estimates, forecasting supply and conservation changes, and selecting an equitable allocating base. The Indus Basin System, with agricultural related conservation needs measured in tens of millions of acre feet is used to illustrate how hydrology issues enter into the allocation and conservation process. Other examples used are the urban northern Illinois area with a Great Lakes diversion totalling over 2 million acre feet annually, and the Lake Minnetonka watershed near Minneapolis with a delicate hydrologic balance having only a few thousand acre feet of runoff. Hydrologists work will continue to be controversial due to the importance of opinion and judgement. Hydrologists will continue to make the best estimates possible to implement beneficial programs while providing as much flexibility for the future as possible. (See also W81-00160) (Seigler-IPA)

PERSPECTIVES ON AGRICULTURAL WATER USE AND CONSERVATION,
Nebraska Univ.-Lincoln. Dept. of Agricultural Engineering.
P. E. Fischbach.
In: Proceedings of the Conference on Water Conservation Needs and Implementing Strategies, July 9-13, 1979, Franklin Pierce College, Rindge, NH, p 122-129, 1979. 6 Tab.

Descriptors: *Irrigation efficiency, *Water conservation, *Irrigation water, *Nebraska, *Irrigation systems, Energy, Cost analysis, Irrigation practices, Crop production, Scheduling, Leaching, Soil water, Root zone, Deep percolation.

Irrigation statistics for 1973 indicate that Nebraska irrigators used 617.8 million kilowatts of electricity, 101 million gallons of diesel fuel, 53.5 million gallons of LP gas, and 5,738 million cubic feet of natural gas to power irrigation pumping plants. Also, most irrigation systems have excess capacity that farmers use to apply unneeded water. Many systems are run nearly continuously during the growing season regardless of rainfall or soil conditions. Irrigation water losses due to runoff or deep percolation represent excess energy requirements. Irrigation systems have different energy requirements with the gated pipe system being the most efficient for Nebraska. New automatic irrigation systems along with improved irrigation management procedures could result in a 37% energy savings over present usage. Nitrate leaching, loss of nitrogen from the root zone, can also occur when excessive irrigation water is used. Increment feeding through the irrigation system could help to reduce this loss. Correct irrigation scheduling could save 35% of the water now used. At present energy prices, a gated pipe system could save $16.50 per acre with good scheduling and a center pivot system could save $28.30 per acre. At $2.00 an acre inch for water the savings here would add another $14.60 per acre. A technology transfer program is needed to train irrigators and consultants in these conservation measures. DROUGHT LESSONS FROM AGRICULTURE,
Utah State Univ., Logan. Dept. of Economics.
H. H. Fullerton.
In: Proceedings of the Conference on Water Conservation Needs and Implementing Strategies, July 9-13, 1979. Franklin Pierce College, Rindge, NH, p 174-181, 1979.

Descriptors: *Agriculture, *Droughts, *Water conservation, *Water policy, Forecasting, Government supports, Drought tolerance, Water supply, Management, Planning, Economics, Water allocation, Water shortage, Water resources development.

The impact that modifications in institutions, management, and policy will have on water conservation will depend greatly on their long-run economic feasibility. Severe droughts in the 1930's and 1970's have produced the following observations: (1) drought prediction within a timeframe useful for planning is virtually nonexistent; (2) estimated drought damages are in general grossly overstated; (3) in almost all cases alternative water sources are less energy efficient than traditional supplies; (4) agricultural prospectives differ greatly from individual producer and consumer perspectives; (5) water resource flexibility is directly related to property rights; (6) governmental expansions can be justified on egalitarian grounds; (7) drought mitigating practices may have serious long-run consequences; (8) drought conditions complicate use efficiency; and (9) drought research cannot be studied as an isolated problem. Little can be gained by continuing to isolate drought from other areas such as meteorology, water management, and land/water interrelationships. This is especially true when drought study financing is being sought. Drought provides lessons by causing us to reexamine our conventional wisdom and by forcing us to give research attention to the fuller utilization of data and research information for immediate management and policy decisions. 4. WATER QUANTITY MANAGEMENT AND CONTROL

4A. Control Of Water On The Surface

EFFECTS OF STREAM CHANNELIZATION ON BOTTOMLAND AND SWAMP FOREST ECOSYSTEMS,
North Carolina State Univ. at Raleigh. School of Forest Resources.
T. E. Maki, A. J. Weber, D. W. Hazel, S. C. Hunter, and B. T. Hyberg.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-111429, Price codes: A09 in paper copy, A01 in microfiche. Research Institute of The University of North Carolina, Raleigh, Report No 147, 1980, 135 p, 26 Fig, 22 Tab, 4 Append. OWRT-B-094-NC (4), 14-34-0001-6107.

Descriptors: Silviculture, *Channeling, *Environmental effects, Channel improvement, *Swamps, *Ecosystems, Surface drainage, Vegetation regrowth, Drainage effects, Streamflow, Wetlands, *Forests, *North Carolina.

An investigation was undertaken to determine the effects of stream channelization on the bottomland-swamp forest ecosystems of Eastern North Carolina. The ground water regimes in the floodplains of cutover and non-cut areas of four channelized streams and seven non-channelized streams were monitored by means of lines of wells positioned perpendicular to each stream channel. The water levels in the wells were measured weekly between January 1975 and July 1977, providing the basis on which the plant communities of the cut and non-cut, channelized and non-channelized swamps could be compared. Growth studies indicated that channelization resulting in moderate average summer water levels was not necessarily detrimental to mature tree growth, including that of 'water loving' species such as water tupelo, swamp blackgum, and bald cypress. Evidence of severe dieback or loss of vigor was noted in trees along the channelized streams only in the few observed instances where water had been backed up by spoil material into stagnant pools or where several feet of soil had been piled against the bases of the trees. A midsummer count showed four times more small tree stems per hectare in the non-channelized areas than in the channelized areas. Survival and growth of planted water tupelo seedlings was notably greater along the non-channelized streams.

HYDROLOGY AND WATER QUALITY OF THE LOWER MISSISSIPPI RIVER,
Geological Survey, Baton Rouge, LA. Water Resources Div.
F. C. Wells.
Louisiana Department of Transportation and Development, Office of Public Works Water Resources Technical Report No 21, 1980. 82 p, 26 Fig, 5 Plates, 17 Tab, 50 Revf.

Descriptors: *Water quality, *Streamflow, *Discharge(Water), *Sediment transport, *Louisiana, Mississippi River, Flow rates, Chemical analysis, Water temperature, Bacteria, Heavy metals, Dissolved oxygen, Organic compounds, Pesticides, Path of pollutants, Benthos, Water utilization, Time of travel, *Lower Mississippi River(LA).

Average discharges for the Mississippi River at Vicksburg, Miss., and Red River-Tarbert Landing are 573,600 and 461,000 cubic feet per second, respectively. An average suspended-sediment load of 630,000 tons per day is transported past Red River-Tarbert Landing; approximately 77 percent as silf and clay. Concentrations of dissolved solids at St. Francisville and Luling, La., are less than 300 milligrams per liter 90 percnet of the time. Concentrations of trace metals are within the recommended limits for public-water-supply sources 99 percent of the time. Dissolved-oxygen concentrations exceed 75-percent saturation 90 percent of the time. DDT, dieldrin, endrin, diaxinon, 2,4-D are the most frequently detected pesticides. Concentrations of volatile organic compounds are generally less than 10 micrograms per liter, and concentrations of 14 semivolatile organic compounds have generally been less than 5 milligrams per liter. The most common and numerous benthic organisms collected are Corbidula and tubificid worms. An average of 6,300 million gallons per day of water was withdrawn from the river below St. Francisville in 1975 for industrial and municipal uses. Average decomposition rates for the Mississippi River ranged from 0.046 to 0.058 (per day, base e). (USGS)

EFFECT OF FLUCTUATING RESERVOIR RELEASE ON THE DOWNSTREAM ENVIRONMENT,
Michigan Technological Univ., Houghton. Dept. of Biological Sciences.
K. J. Kraft, and N. D. Mundahl.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-115677, Price codes: A02 in paper copy, A01 in microfiche. Institute of Water Research, Michigan State University, East Lansing, Project Completion Report, August, 1980, 17 p, 4 Fig, 8 Tab, 136 Ref. OWRT A-105-MICH(1), 14-34-001-9024, 0124.

Descriptors: *Sturgeon River(MI), *Reservoir releases, *Environmental effects, *Downstream, *Water quality, Benthic fauna, Benthos, Turbidity, Water temperature, Powerplants.

Temperature, depth, width, current velocity, turbidity, conductivity, and benthic macroinvertebrates were examined for one year above and below the Prickett Generating Station on the Sturgeon River. For most of the year this generating station operated during the day and shut down at night and on weekends. On days with on-off generator operation, downstream diurnal temperature ranges were similar to those upstream, but on days with continuous generation downstream temperatures for at least 10 km remained relatively constant. The maximum temperature upstream was 22C, 200 m downstream 24.5C, and 10 km downstream 23C. Current during generation more than doubled at 200 m downstream, but increased only slightly 10 km downstream. Depth during generation increased 75 cm at 200 m downstream and 40 cm 10 km downstream. Width during generation increased 7 to 10 m. Turbidity ranged from 7 to 12 ppm SiO2 and conductivity from 120 to 150 micro mhos/cm. Invertebrate density and biomass were lowest in May and highest in September and October. At 200 m downstream density averaged 5.6 x greater and biomass 6.9 x greater than upstream.

At 10 km downstream density averaged 2.4 x and biomass 1.7 x greater than upstream. The total number of taxa collected upstream was 56, at 200 m downstream 50, and 10 km downstream 61. A large, diverse benthic macroinvertebrate community occurred immediately downstream from the generating station suggesting that the on-off mode of generation may be less detrimental to downstream biota than continuous operation which dampens normal diurnal temperature fluctuations and delays seasonal temperature changes.

HYDROLOGY OF THE CHICOD CREEK BASIN, NORTH CAROLINA, PRIOR TO CHANNEL IMPROVEMENTS,
Geological Survey, Raleigh, NC. Water Resources Div.
C. E. Simmons, and M. C. Aldridge.
Available from OFSS, USGS, Box 25425, Fed. Ctr., Denver, CO 80225, paper copy $4.00, microfiche $3.50. Geological Survey Open-File Report 80-680, 1980. 27 p, 9 Fig, 8 Tab, 8 Ref.

Descriptors: *Effects, *Excavation, *Channel improvement, *Watersheds(Basins), *North Carolina, Data collections, Observation wells, Streamflow, Flood flow, Storm runoff, Surface groundwater relationships, Base flow, Water quality, Nutrients, Pesticides, Bacteria, Water pollution sources, *Chicod Creek basin(NC).

Extensive modification and excavation of stream channels in the 6--square mile Chicod Creek basin began in mid-1979 to reduce flooding and improve stream runoff conditions. The effects of channel improvements on this Coastal Pain basin's hydrology will be determined from data collected prior to, during, and for several years following channel alternations. This report summarizes the findings of data collected prior to these improvements. During the 3-year study period, flow data collected from four stream gaging stations in the basin show that streams are dry approximately 10 percent of the time. Chemical analyses of water samples from the streams and from eight shallow groundwater observation wells indicate that water discharge from the surficial aquifer is the primary source of streamflow during rainless periods. Concentrations of Kjeldahl nitrogen, total nitrogen, and total phosphorus were often 5 to 10 times greater at Chicod Creek sites than those at nearby baseline sites. It is probable that runoff from farming and livestock operations contributes significantly to these elevated concentrations in Chicod Creek. The only pesticides detected in stream water were low levels of DDT and dieldrin, which occurred during storm runoff. A much wider range of pesticides, however, are found associated with streambed materials. The ratio of fecal coliform counts to those of fecal streptococcus indicate that the streams receive fecal wastes from livestock and poultry operations. (USGS)

DRAINAGE FOR AN INDUSTRY/OFFICE COMPLEX,
Halff (Albert H.) Associates, Inc., Dallas, TX.
J. I. Novoa, and M. K. Koesling.
Public Works, Vol 111, No 10, p 64-65, October, 1980. 2 Fig.

Descriptors: *Flood plains, *Land reclamation, *Sumps, *Drainage engineering, *Sewers, Storm drains, Construction, Industrial plants, Excavation, Landscaping, Flood control, Land management, Texas.

A well planned office and industrial center was built in the reclaimed flood plain of the Elm Fork of the Trinity River in Texas. The district required construction of sumps within the subdivision to provide flood storage and installation of improved water mains, sanitary sewers, and storm sewers. The sump also was to provide an outlet for all other storm sewers. A reduced cost for storm sewers, an increased sump-storage capacity, the utilization of excess sump excavation to construct positive site drainage, and an attractive landscape were among the benefits derived from this design. RELATIONSHIPS OF DISSOLVED OXYGEN AND BIOCHEMICAL OXYGEN DEMAND IN SEWAGE EFFLUENT RELEASES,
Arizona Univ., Tucson. Dept. of Civil Engineering and Engineering Mechanics.
P. G. Sebenik.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-115206, Price codes: A05 in paper copy, A01 in microfiche. M.S. Thesis, 1975. 71 p, 8 Fig, 11 Tab, 24 Ref, 2 Append. OWRT A-051-ARIZ(1), 14-31-0001-5003.

Descriptors: *Ephemeral streams, *Open channel flow, *Physicochemical properties, *Sewage effluents, Southwest U.S., Dissolved oxygen, Biochemical oxygen demand, Streamflow, Water quality, Path of pollutants, Groundwater, Seepage.C.

Bio-physicochemical measurements were made on treated sewage effluent releases at established locations within the channel of an ephemeral stream, the Santa Cruz River of Southern Arizona. Water quality samples were taken in chronological sequence, so that incremental flows at low and high hydrograph stages could be traced as the effluent moved downstream. Results indicate that DO concentrations at low effluent flows were higher than DO concentrations at high effluent flows; while, conversely, BOD concentrations at low effluent flows were generally lower than BOD concentrations at high effluent flows. Biochemical oxygen demand concentrations are affected by waste loadings, flow conditions, phytoplankton growth and nitrification. Mean river deoxygenation rates (kr) in sewage flows after six river miles from the Tucson Sewage Treatment Plant were always negative or increasing, which is probably due to nitrification, algal growth, and concentration of organic constituents through seepage losses.

A SUMMARY REPORT, SOUTHEAST CONFERENCE ON GROUND WATER MANAGEMENT, BIRMINGHAM, ALABAMA, JANUARY 30-31, 1980,
D. H. Howells.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-119489, Price codes: A03 in paper copy, A01 in microfiche. Southeast Water Resources, Vol 2, No 2, Fall 1980. University of North Carolina Water Resources Research Institute, Chapel Hill, NC, 42 p. OWRT-B-123-NC(7), B-125-NC(6).

Descriptors: *Water management(Applied), *Groundwater resources, *Groundwater, *Conferences, *Water resources institute, Water utilization, Groundwater availability, Water pollution, Mathematical models, Water policy, Legislation, Waste water treatment, Runoff, Water resources, Water resources development, Planning, State governments, Southeast U.S., Alabama, Florida, Georgia, North Carolina, South Carolina, Tennessee, Virginia.

A summary report is given on a conference on Groundwater Management, the fourth in a series of invitational regional conferences on significant water resource problems of the Southeast. The objectives of this conference were to explore the strengths/weaknesses of State programs related to groundwater management and to identify/describe remedies in areas of legislation, administrative procedures, funding levels, research, technology transfer and education. Summaries contained in this report were taken from papers presented under categories on State groundwater programs/problems (covering Alabama, Florida, Georgia, North Carolina, South Carolina, Tennessee and Virginia), national policy, mathematical modeling for groundwater management, conjunctive management of ground and surface water, organic chemical pollution, well injection of wastes and runoff, waste water treatment for groundwater quality protection, and new programs in surface mining hydrology. General conclusions and recommendations on State programs and problems are summarized. (Zielinski-IPA)

GEOLOGIC AND HYDROLOGIC DATA FROM A TEST-MONITOR WELL AT FERNANDINA BEACH, FLORIDA,
Geological Survey, Tallahassee, FL. Water Resources Div.
D. P. Brown.
Available from OFSS,USGS Box 254 25, Fed. Ctr Denver CO 80225, paper copy $5.00, microfiche $3.50. Geological Survey Open-File Report 80-347, 1980. 36 p, 13 Fig, 7 Tab, 3 Ref.

Descriptors: *Hydrogeology, *Hydrologic data, *Test wells, *Groundwater, *Water quality, Water yield, Observation wells, Drilling, Sampling, Stratigraphy, Logging(Recording), Water analysis, Temperature, Aquifers, Florida, *Nassau County(FL), *Floridan aquifer(FL).

A 2,102-foot observation well was drilled at Fernandina Beach, Florida, to obtain geologic and hydrologic data. Drill cuttings, water samples, and water-level measurements were collected. Geologist's, driller's, and geophysical logs were completed. The well is constructed with 12-inch diameter casing to a depth of 515 feet and 6-inch diameter casing from 515 to 2,000 feet. The remainder is open hole. The uppermost 500 feet of material penetrated by the well consists of sand, clay, limestone, and dolomite. In the remainder of the hole, the material consists of fragmental and granular limestone and massive to finely crystalline dolomite, which comprise the Floridan aquifer in the area. After the well was completed, water levels in the monitored zone, 2,000 to 2,102 feet, were above land surface. During July and August 1979, water levels ranged from about 8 to 13 feet above land surface. Chloride concentrations of water sampled through the drill stem from a depth of 632 to 2,039 feet ranged from 25 to 710 milligrams per liter. Chloride increased markedly below 2,039 feet to a maximum of 7,800 milligrams per liter at 2,094 feet. After completion of the well, chloride was 8,100 milligrams per liter. (USGS)
W81-00151

HYDROLOGIC MONITORING PROGRAM IN ELDRIDGE-WILDE AND EAST LAKE ROAD WELL-FIELD AREAS, PINELLAS AND HILLSBOROUGH COUNTIES, FLORIDA, 1977 WATER YEAR,
Geological Survey, Tallahassee, FL. Water Resources Div.
B. F. Joyner, and J. M. Gerhart.
Available from OFSS, USGS, Box 25425, Fed. Ctr. Denver CO 80225, paper copy, $5.00, microfiche $3.50. Geological Survey Open-File Report 80-345, 1980. 34 p, 20 Fig, 4 Tab, 13 Ref.

Descriptors: *Observation wells, *Monitoring, *Water levels, *Water quality, *Florida, Groundwater, Aquifers, Saline water-freshwater interface, Saline water intrusion, Rainfall, Pumping, Drawdown, Water table, Potentiometric level, Hydrologic data, *Floridan aquifer, Pinellas County(FL), Hillsborough County(FL), Well fields.

The observation-well network in the vicinity of the two well fields is described in detail. Data obtained from the network from October 1976 through September 1977, as well as rainfall and pumpage records, are presented and discussed. Below-normal rainfall caused the water table and potentiometric surface of the Floridan aquifer in Eldridge-Wilde well field to recover 2 feet less in September 1977 than in the previous September. Water levels in East Lake Road will field were approximately the same in Spetember of both years. The Southwest Florida Water Management District has established regulatory water-level and water-quality

limits in several observation wells. Water levels did not drop below regulatory limits during the year. Water from two deep wells west of Eldridge-Wilde well field exceeded the regulatory limits for chloride concentrations. The position of the 250 milligram per liter chloride line is shown in cross section in the vicinity of Eldridge-Wilde well field in September 1977. Network modifications are proposed that would result in a more comprehensive knowledge of the hydrologic system. (USGS)

GROUND-WATER DATA FOR BILLINGS, GOLDEN VALLEY AND SLOPE COUNTIES, NORTH DAKOTA,
Geological Survey, Bismarck, ND. Water Resources Div.
L. O. Anna.
North Dakota County Ground-Water Studies 29--Part II, and North Dakota Geological Survey Bulletin 76--Part II, 1980. 241 p, 2 Fig, 1 Plate, 9 Tab, 25 Ref.

Descriptors: *Groundwater, *Basic data collections, *North Dakota, *Aquifer characteristics, *Water quality, Water supply, Groundwater availability, Hydrogeology, Water wells, Groundwater recharge, Well data, Water yield, Potential water supply, Observation wells, Water levels, Water users, Chemical analysis, Billings County(ND), Golden Valley County(ND), Slope County(ND).

The purpose of the investigation in Billings, Golden Valley, and Slope Counties, ND., was to determine the availability and quality of ground water for municipal, domestic, industrial, and irrigation uses. Specifically, the objectives were to: (1) determine the location, extent, and nature of the major aquifers and confining beds; (2) evaluate the occurrence and movement of ground water, including the sources of recharge and discharge; (3) estimate the quantities of water stored in the aquifers; (4) estimate the potential yields of wells tapping the major aquifers; (5) determine the chemical quality of the ground water; and (6) estimate the water use. The data in this report were collected between 1974 and 1977. The data consist of the following; (1) Geologic and hydrologic records for 723 wells, test holes, springs, and miscellaneous data-collection sites; (2) water-level measurements in 48 observation wells; (3) lithologic and geophysical logs of 367 test holes and wells; (4) 273 chemical analyses of ground water; (5) 33 chemical analyses of surface water during low flow; (6) 18 chemical analyses of ground water for trace constituents; (7)9 chemical analyses of ground water for dissolved gases; (8) 62 analyses of core samples for hydraulic parameters and particle-size distribution; and (9) 29 analyses of core samples for heavy mineral content. GROUND-WATER RESOURCES OF DICKEY AND LA MOURE COUNTIES, NORTH DAKOTA,
Geological Survey, Bismarck, ND. Water Resources Div.
C. A. Armstrong.
North Dakota County Ground-Water Studies 28--Part III, and North Dakota Geological Survey Bulletin 70-Part III, 1980. 61 p, 18 Fig, 2 Plates, 3 Tab, 47 Ref.

Descriptors: *Groundwater resources, *North Dakota, *Aquifer characteristics, *Water yield, *Water quality, Water supply, Chemical properties, Groundwater availability, Hydrogeology, Water wells, Data collections, Water level fluctuations, Groundwater recharge, Transmissivity, Maps, Hydrographs, Water utilization, Dickey County(ND), LaMoure County(ND).

Ground water in Dickey and LaMoure Counties, ND., is obtained from Glacialdrift aquifers of Quaternary age, the Pierre, Newcastle, and Lakota-Fall River aquifers of Cretaceous age, and the Black Island aquifer of Ordovician age. The major glacial-drift aquifers, at depths of 0 to 304 feet, will yield as much as 1,500 gallons per minute of water containing 248 to 1,890 milligrams per liter dissolved solids. The Pierre aquifer generally yields less than 5 gallons per minute to wells. The water contains from 1,400 to 8,630 milligrams per liter dissolved solids. The Newcastle aquifer system, is at depths ranging from 790 to somewhat more than 2,000 feet, and is separated into two aquifers. Well yields generally are less than 80 gallons per minute. Dissolved-solids concentrations range from 2,060 to 4,590 milligrams per liter. The Lakota-Fall River aquifer, at depths of 1,100 to 2,200 feet, locally should yield as much as 1,000 gallons per minute. Dissolved-solids concentrations range from 2,030 to 4,850 milligrams per liter. The Black Island aquifer, at depths from 1,421 to 3,000 feet, contains water that has 2,520 and 3,800 milligrams per liter dissolved solids. (USGS)
W81-00159

DESIGN IS THE KEY TO A GOOD RECHARGE WELL,
UOP, Inc., St. Paul, MN. Johnson Div.
A. J. Smith.
Public Works, Vol 111, No 10, p 66-67, October, 1980. 2 Fig.

Descriptors: *Artificial recharge, *Recharge wells, *Design, *Injection wells, *Injection, Induced infiltration, Pore water, Well screens, Thermal properties, Head loss, Groundwater recharge.

A recharge well located near Grand Island, Nebraska is described which was pumped continuously at a rate of 750 gpm for 6 months. The use of injection water which was nearly sand free is credited with the long-lasting period of pumping. Designing a sand-free well requires sizing of the screen slot in accord with established standards of natural development or gravel packing. The well must be able to recharge at a rate equal to the production rate. The screen must also take full advantage of the aquifer characteristics. The diameter of the well is an important factor which is often determined by the size of the pump selected to be installed. Accurate placement of the screen in the permeable zones is a vital step in design of the well. In injection wells it is often recommended that large parts of the aquifer be screened as opposed to only the most productive parts. Problems such as plugging due to air entrainment, precipitates, and bacteria and thermal interference are discussed. (Baker-FRC)

4C. Effects On Water Of Man's Non-Water Activities

HYDROLOGICAL AND ENVIRONMENTAL CONTROLS ON WATER MANAGEMENT IN SEMIARID URBAN AREAS,
Arizona Water Resources Research Center, Tucson.
S. Resnick, and K. J. DeCook.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-109704, Price codes: A05 in paper copy, A01 in microfiche. Project Completion Report, September, 1980. 70 p, 14 Fig, 19 Tab, 7 Ref, Append. OWRT B-012-ARIZ (6), 14-31-0001-3056.

Descriptors: Urbanization, Water management(Applied), Water reuse, *Urban runoff, *Semiarid climates, *Water pollution sources, *Water treatment, *Rainfall-runoff relationships, Small watersheds, Arizona.

Rainfall and runoff studies initiated in 1968 by the University of Arizona provide data for three small urban watersheds with different land use patterns in Tucson, AZ. Annual precipitation of about 11 inches produces annual runoff, as measured at outflow flumes, ranging from 1.30 to 3.95 inches, produced by 15 to 23 runoff events per year. About 60 to 70% of the annual runoff events occur in the summer season, as does 65 to 75% of the annual volume of measured runoff. Water samples collected on a lumped basis show generally high concentrations of suspended sediment, bacterial loading, and dissolved organics. Initial field treatment and exploratory laboratory studies of treatment methods indicate that three days is an optimal length of time for detention storage of runoff, reducing average pollutant concentrations to 62 mg/1 of turbidity, total coliform of 70-3200 organisms per 100 mg/1, and 7 mg/1 of chemical oxygen demand. Simple laboratory treatment with alum and polyelectrolyte yielded an 80% reduction in COD, 90% reduction in bacterial loading, and appreciable clarification of the runoff samples. Continuing research should be conducted to utilize a longer data record for improving understanding of rainfall-runoff relations; to use distributed sampling within individual watershed areas to define specific pollutant source areas; and to incorporate economic and legal questions involved in the utilization of urban runoff in an arid area.
W81-00006

EFFECTS OF URBAN RUNOFF AND WASTEWATER EFFLUENT ON WILSONS CREEK AND JAMES RIVER NEAR SPRINGFIELD, MISSOURI,
Geological Survey, Rolla, MO. Water Resources Div.
W. R. Berkas.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-201775, Price codes: A03 in paper copy, A01 in microfiche. Geological Survey Water-Resources Investigations 80-27, March 1980. 31 p, 15 Fig, 4 Tab, 10 Ref.

Descriptors: *Water pollution effects, *Urban runoff, *Municipal wastes, *Water quality, *Missouri, Effluents, Water pollution sources, Streamflow, Rainfall, Storm runoff, Flood frequency, Hydrologic data, *Wilsons Creek(MO), *James River(MO), *Springfield(MO).

Statistical analysis on water-quality parameters from James River upstream and downstream from the confluence of Wilsons Creek shows a significant difference for all parameters except temperature and dissolved silica at the 0.05 probability level. Regression analysis shows correlation for discharge with dissolved sodium, dissolved chloride, and dissolved potassium, and for specific conductance with dissolved chloride and dissolved sulfate at the station downstream from Wilsons Creek. This is due to the consistent quality of the effluent from the Southwest Wastewater Plant on Wilsons Creek. Water-quality monitor stations upstream and downstream from the wastewater plant indicate that the plant has a degrading effect on dissolved oxygen in Wilsons Creek and James River. The monitors also indicate that rainfall flushes momentarily poor quality water into Wilsons Creek from the urbanized Springfield area. Overall, the runoff is diluting the effluent from the wastewater plant. Rainfall and runoff stations indicate a rapid response of runoff to rainfall due to the high percentage of imperviousness and the filling or paving of sinkholes. (USGS)

THE MANGROVE SWAMP - AN ECOSYSTEM IN DANGER,
Swedish Water and Air Pollution Research Lab., Stockholm.
O. Linden, and A. Jernelov.
Ambio, Vol 9, No 2, p 81-88, 1980. 7 Fig, 42 Ref.

Descriptors: *Mangrove swamps, *Land forming, *Erosion control, *Coasts, *Soil stabilization, Flood control, Vegetation establishment, Marine animals, Life cycles, Ecology, Ecosystems, Tropical regions, Water pollution effects, Thermal pollution, Herbicides, Land reclamation, Land development.

Coastal mangrove swamp ecosystems are becoming threatened by pollution and land reclamation. Mangrove swamps exist in tropical areas with high

year-round precipitation usually between the high and low tide marks and often form the boundary between oceans and tropical forests. Mangrove environs are characterized by a thick layer of very loose organic soil which is anaerobic just below the sediment surface; this soil is partly formed by the detritus of the mangroves and silt that is washed in and held by the mangrove swamps. The accumulation of sediments and detritus and the growth of widespread root systems to accommodate the loose, anaerobic soil contribute to rapid land formation by mangrove swamps and also provide significant erosion protection. Various flora and fauna ecosystems are associated with mangrove swamps and some organisms are dependent upon mangroves for shelter as well as food during larval and juvenile stages of development. Mangroves are highly susceptible to herbicides and thermal pollution and grow in areas frequently exposed to oil contamination. The mangrove swamps are also impacted by land reclamation activities and by harvesting; these activities have led to flooding and the destruction of other forms of vegetation. (Lisk-FRC)

UNDERGROUND DERELICTION IN THE NORTH WEST,
J. G. Lloyd.
Water Services Vol 8, No 1014, p 519-520, 523-524, 527, August, 1980. 4 Fig.

Descriptors: *Underground structures, *Urbanization, *Water resources development, *History, *Water districts, Sewers, Sewerage, Water pollution, Industrial wastes, Storm drains, Local governments, Costs, Overflow, Repairing, Construction, Collapse.

The development of sewage drainage systems and water supplies in the industrial northwest of England (including the cities of Liverpool and Manchester) is described. With the rapid industrialization of the first half of the 19th century, wells, springs and rivers rapidly became polluted from overloaded and piecemeal drainage systems. By the 1840s, major contributions were looking beyond their boundaries for unpolluted water, and by 1850 a series of catchment reservoirs was established in the Pennine hills. However, until 1974, 58 separate local authorities managed the sewers and sewage disposal in the area of Greater Manchester County. Since then, water supplies have been managed on a regional basis. In the early 1800s, various types of design and construction were used to build the surface water sewers, and most of these early sewers were built of poor quality soft bricks. Many sewers and old water mains need to be replaced on a large scale due to unsatisfactory forms of construction, decrepit structural condition, inadequate carrying capacity, and inappropriate location. Flooding by sewage in streets and homes, underground decay causing sewer collapses, and the proliferation of storm sewage overflows from sewerage system to watercourses, point to the need for restructuring and repairing existing systems rather than simply repairing collapses. Financial assistance from the national government will be necessary to repair underground dereliction while at the same time further developing water resources and reducing pollution. (Baker-FRC)

4D. Watershed Protection

SEDIMENT-TRAP EFFICIENCY OF A MULTIPLE-PURPOSE IMPOUNDMENT, NORTH BRANCH ROCK CREEK BASIN, MONTGOMERY COUNTY, MARYLAND, 1968-76,
Geological Survey, Harrisburg, PA. Water Resources Div.
W. J. Herb.
Available from Supt. of Documents, GPO, Washington, DC 20402, Price, $2.50. Geological Survey Water-Supply Paper 2071, 1980. 41 p, 19 Fig, 11 Tab, 19 Ref.

Descriptors: *Sediment control, *Trap efficiency, *Storm runoff, *Multiple-purpose reservoirs, *Maryland, Small watersheds, Urbanization, Land use, Stream flow, Flo characteristics, Suspended load, Bed load, Sediment transport, Sediment yield, Particle size, *Noth Branch Rock Creek basin(MD), *Montgomery County(MD).

Lake Bernard Frank, a multiple-purpose reservoir in Montgomery County, Md., impounds runoff and sediment from 12.5 square miles of the upper North Branch Rock Creek basin. A U.S. Geological Survey study between 1967 and 1976 measured a sediment-trap efficiency of 96 percent for the impoundment. The impoundment's capacity-inflow ratio of 0.37 indicates a theoretical trap efficiency of 95 percent. Suspended-sediment outflow from the impoundment was measured as 5,910 tons for the 1968-76 water years. A total sediment inflow of 136,000 tons was estimated for the same priod. The inflow estimate was based on measured inflow, inflow computed from daily sediment-transport curves, inflow computed from land-use/land-cover sediment-yield relationships, and empirical bedload equations. Discharge-weighted percentages of sand, silt, and clay averaged 16, 50, and 34 percent upstream from the impoundment and were zero, 16, and 84 percent below the reservoir. Average streamflow conditions and recent sediment yields indicate the total sediment-pool capacity will be filled in 27 more years, or by the year 2003. (USGS)

DEVELOP WATER MANAGEMENT METHODS FOR WATERSHEDS SUBJECT TO INTENSIVE DEVELOPMENT,
Arizona Univ., Tucson. Water Resources Research Center.
J. Ben-Asher, M. Diskin, U. Kafri, S. D. Resnick, and M. Sneidovich.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-113318, Price codes: A03 in paper copy, A01 in microfiche. Partial Project Completion Report, September, 1980. 28 p, 6 Fig, 8 Tab, 13 Ref. OWRT-A-069-ARIZ(4), 14-34-0001-6003.

Descriptors: *Model studies, *Hydrologic budget, Water balance, *Equations, *Watersheds(Basins), *Water management(Applied), Hydrology, Hydrologic systems, Hydrologic properties, Mathematical studies, Rational formula, Groundwater basins, Groundwater, Water quality, Chemical analysis, Evapotranspiration, Basins, Runoff, Lakes, Mathematical models, Engineering, Hydrologic aspects.

Assessment was made that a model of the hydrologic system is the only possible link between the hydrologist and the systems engineer in dealing with water management methods for watersheds potentially subject to intensive future development, as exemplified by the Sonoita Creek Basin in Arizona. The water balance picture taken by the hydrologist must be advanced to where the response will be known of the considered aquifer to different water policies. From this point, integration of the environment with its management can be properly addressed. An appropriate model is the overall goal of a hydrologists' study, since it will enable him to simulate relationships between recharge, discharge, and groundwater elevation. Hence, a water balance model was calibrated, and a working routine was developed with the model that was used by the systems engineers. Water balance equations consider Basin precipitation, groundwater underflow into the Basin, Basin evapotranspiration, evapotranspiration from the lake and vegetation strip, groundwater outflow from the Basin, groundwater inflow into the lake and vegetation strip, groundwater recharge, runoff, and change in soil and groundwater storage. Groundwater quality was determined by standard chemical analysis (plus iron, copper, zinc, and lead) on well water samples. (Zielinski-IPA)

5. WATER QUALITY MANAGEMENT AND PROTECTION

5A. Identification Of Pollutants

SEPTIC TANK DRAINFIELD FAILURES RESULTING FROM MINERALOGICAL CHANGES,
Virginia Polytechnic Inst. and State Univ., Blacksburg, VA. Dept. of Agronomy.
L. W. Zelazny, D. A. Lietzke, and H. L. Barwood.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-114662, Price codes: A07 in paper copy, A01 in microfiche. Virginia Water Resources Research Center, Virginia Polytechnic Institute and State University Bulletin 124, September 1980, 118 p, 71 Fig, 19 Tab, 36 Ref. OWRT A-079-VA(1).

Descriptors: *Septic tank drainfield failures, *Mineralogical changes, *Soils, *Groundwater, Water pollution, Wastewater, Waste disposal, Sewage, Chemical analysis, Cation exchange, Water analysis, Soil analysis, Analytical techniques, *X-ray diffraction.

The purpose of this study was to determine whether septic tank drainfield failures in areas containing soils with a high biotite or chloritized vermiculite component could be the result of mineralogical changes that decrease the permeability of the soil at the drainfield interface. Twenty-four drainfields in 5 Virginia counties were examined. Soil samples were taken at 16 sites and examined in the laboratory for chemical and mineralogical changes. Visible alterations were detected at the soil-drainfield interface, and all systems examined showed some chemical change. X-ray diffraction analysis revealed a mineralogical change in 12 sites, with 6 of these sites showing distinct change, consisting primarily of the conversion of vermiculite chlorite intergrade into vermiculite and sometimes some montmorillonite, with some dissolution of kaolinite. Soil samples from sites with significant vermiculite chlorite intergrade content showed an increase in the sum of exchangeable bases at the soil-drainfield interface, apparently linked to interlayer removal and vermiculite formation. The exchange complex of the soil at the drainfield interface was selective for calcium and sometimes magnesium and was not dominated with sodium, which was high in the effluent. Samples from some sites did show an increase in organic matter at the interface. However, the increase was not considered sufficient to cause a reduction of flow in the drainfield. Field examinations of the soils revealed that the primary mode of effluent movement was channelized flow. At no site did the drainfield fail for purely mineralogical reasons. However, the changes detected could contribute to the eventual failure of the system by decreasing soil permeability, especially in soils with initial low permeability.

DEVELOPMENT AND EVALUATION OF ELECTROANALYTICAL METHODS FOR DETERMINATION OF METAL-ION CONCENTRATIONS IN WATER.
West Virginia Univ., Morgantown. Water Research Inst
J. H. Strohl, B. Bezilla, R. Romanosky, and J. T Maloy
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-110736, Price codes: A02 in paper copy, A01 in microfiche. Technical Completion Report 1980. 18 p, 4 Fig, 2 Ref. OWRT-A-035-WVA (1), 14-34-0001-0852.

Descriptors: Analysis, Analytical techniques, *Electrochemistry, *Methodology, *Trace elements, *Water analysis, Anodes, Chemical analysis, Electrodes, Electrolysis, Evaluation, Metals, Mine water, Water pollution, Water quality, Silver, Copper, Cadmium, Zinc.

This study was directed toward the development of electrochemical procedures that would be suitable for the on-site determination of the concentra-

tions of some metal ions and halide ions. The methodology was based on semi-integral analysis for the qualitative identification and on stripping analysis for the quantitative determination of metal ions. Of the three electrode systems developed as a part of this project, two systems were found to be suitable for portable use. The overall system was found to be capable of determining silver, copper, cadmium, and zinc (Ag(+), Cu(2+), Cd(2+), and Zn(2+)) concentrations as low as 0.08 parts per million (ppm), chloride as low as 0.35 ppm, and ferrous iron (Fe(2+)) and ferric iron (Fe3+)) at the 0.3 ppm level.

PRODUCTIVITY OF GREAT LAKES ZOOPLANKTON,
Ohio State Univ., Columbus. Dept. of Zoology.
D. A. Culver.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-109829, Price codes: A04 in paper copy, A01 in microfiche. Water Resources Center, Ohio State University Project Completion Report No 710799-760851, May 1980, 60 p, 14 Fig, 8 Tab, 30 Ref, 3 Append. OWRT-A-048-OHIO (1).

Descriptors: *Great Lakes, *Zooplankton, *Productivity, Cladocera, Copepoda, Rotifera, Lake Erie, Lake Ontario, Toxicity, Non-ionic detergents, Forecasting, Growth rates, *Mathematical models.

A mathematical model of zooplankton productivity for the Laurentian Great Lakes has enabled us to calculate productivity rates for Cladocera, Copepoda, and Rotifera from Lakes Ontario and Erie. Productivity values from the Bay of Quinte, Lake Ontario, demonstrated that nearshore productivity and biomass varied greatly along with algal abundance and temperature. A study of 30 stations in Lake Erie on 10 monthly cruises showed that total productivity of the zooplankton community is strongly correlated with temperature, but that individual taxa varied significantly throughout the season. Productivity in the open water of Lake Erie (1970) was much less than the values observed in the Lake Erie and Lake Ontario nearshore zones. Comparison of the roles of Copepoda, Cladocera, and Rotifera in the over-all productivity showed that Copepoda predominated in the spring, along with rotifers, but that Cladocera were the most important producers during the summer. Measurements of cladoceran size at first reproduction showed that they reach maturity at a large size in the spring and decline in size at maturity through the summer, with all species declining in size in a synchronous pattern. It is suggested that this pattern results from the combined effects of size-selective predation by fish and competition among cladocerans for food.

DEVELOPMENT OF A SIMPLE MEANS FOR PREDICTING ALGAL BLOOMS,
Syracuse Univ., NY. Dept. of Civil Engineering.
S. Litten, S. W. Effler, and M. Meyer.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-112625, Price codes: A04 in paper copy. Technical Completion Report, September 1980. 53 p, 22 Fig, 16 Tab, 19 Ref. OWRT-B-087-NY (1), 14-34-0001-9086.

Descriptors: *Algae, *Algal control, Algicides, Biomass, Algal blooms, Color, Copper sulfate, *Lakes, Reservoirs, Phytoplankton, Chlorophyll, Indicators, Predicting algal blooms, New York, Syracuse area(NY).

A simple technique to predict the future occurrence of algal blooms was evaluated for seven test lake systems proximate to Syracuse, NY during the summer of 1978 and 1979. The selected test systems represent a broad range of trophic status, from mesotrophic to hypereutrophic. The technique includes a simple filtering process followed by the identification of the color imparted to the filter, based on comparison to National Bureau of Standards' color chips. The reference measure of phytoplankton standing crop was chlorophyll-a. Particular colors of filtered particulates were not demonstrated to be useful estimators of chlorophyll-a concentration, though the hues olive and yellow- green were associated with higher chlorophyll-a levels. In several of the lakes particulate lightness and color saturation were significant estimators of chlorophyll-a. In addition, the particulate color method was demonstrated to be useful in following certain physical/chemical changes in a lake.

TESTS OF TWO FLUOROMETRIC ASSAYS FOR GONYAULAX AND APHANIZOMENON TOXINS,
New Hampshire Univ., Durham. Dept. of Biochemistry.
P. W. Carter.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-112740, Price codes: A04 in paper copy. Master of Science Thesis, 1980. 43 p, 14 Fig, 3 Tab, 36 Ref. OWRT-A-047-NH (4), 14-34-0001-8031.

Descriptors: *Bioassay, *Assay, *Shellfish, *Toxins, *Red tides, Analytical techniques, Fluorometer, Dinoflagellates, Poisons, Blue-green algae, Algae blooms, *Solution fluorometric assay, Paralytic shellfish poisoning, Algae extracts, Column fluorometric assay, Aphanizomenon flos-aquae, Column chromatography, Spectrofluorometer, Food poisoning.

The purpose of this research was to further test two assay procedures with shellfish extracts and with A. flos-aquae cells: a solution fluorometric assay and a column chromatography assay using Dowex AG-50W-X4, a sulfonic acid cation exchange resin, both developed by Shoptaugh. The assays were also tested to see if an inexpensive filter fluorometer could be used instead of the spectrofluorometer used in developing the assays. Attempts were also made to clean up the shellfish extracts by column chromatography in order to improve the sensitivity of the assay when used with the filter fluorometer. The research demonstrated that the solution fluorometric assay for PSP in shellfish gives results which are comparable to the mouse assay for shellfish of high toxicity and which are possibly more accurate than the mouse assay for shellfish of low toxicity. The assay, therefore, merits consideration for the routine monitoring of toxicity of shellfish. It was also shown that the assay was ineffective when a less expensive filter fluorometer was used in place of a spectrofluorometer. Attempts to modify the assay for use with a filter fluorometer were unsuccessful, but the problems encountered with the chromatographic clean-up of the extracts do not seem to be insurmountable. It is likely, therefore, that the assay could be adapted for use with a filter fluorometer. The column fluorometric assay appeared to be in applicable to shellfish extracts, a finding which contradicts Shoptaugh's data. However, this assay did appear to be of some use when applied to extracts of the blue-green alga Aphanizomenon flos-aquae.

EFFECTS OF A HEPATIC TOXIN FROM THE CYANOPHYTE, MICROCYSTIS AERUGINOSA,
New Hampshire Univ., Durham. Dept. of Zoology.
T. L. Foxall.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-112708, Price codes: A06 in paper copy. Ph.D. Thesis, 1980. 107 p, 17 Fig, 2 Tab, 55 Ref, 1 Append. OWRT-A-047-NH (3), 14-34-0001-8031.

Descriptors: *Toxins, *Cyanophyta, *Blue-green algae, Poisins, Microorganisms, *Eutrophication, Lakes, Ponds, Evironmental effects, Ecosystems, *Hepatic toxin, *Microcystis aeruginosa, *Cyanobacteria, *Microcystin, Freshwater blooms, Liver damage, Blooms.

Toxic cyanobacteria bloom in eutrophic, freshwater lakes and ponds and may cause environmental, health and recreational problems during or after the massive growth of these microorganisms. Microcystis aeruginosa is commonly involved in freshwater blooms and one of its toxins (microcystin) causes liver damage in birds and mammals. This sutdy has determined the specific site of action of microcystin and characterized the hepatic damage at the ultrastructural level. Histological changes in centrilobular regions of liver tissure were noted after intraperitoneal administration in mice. Hepatic sinusoidal epithelial and hepatocyte plasma membranes ruptured with the release of cellular components that pooled with blood. Mitochondria appeared swollen but there were no obvious distortions of other organelles. Extensive vesiculation of membrane fragments was observed. Hepatic damage caused massive hemorrhaging into the liver where blood and cell debris accumulated and produced a significant increase in liver weight. Primary cultures of hepatocyte microexplants from pre- and postnatal mice and rats were exposed to microcystin but in vitro effects were not observed. In vitro experiments showed that young animals were not sensitive to the toxin but developed sensitifity as they matured. Microcystin was shown to be very specific in its site of action since it had no antiplanktors, crustacea, amphibians and teleosts. Electrical or mechanical activity in isolated nerve, nerve-muscle and cardiac preparations also was not effected. Toxins came from cultured cells and naturally occurring blooms and gave identical results in all experiments.

A TRIHALOMETHANE STUDY OF THE DURHAM, NEW HAMPSHIRE WATER TREATMENT PLANT,
New Hampshire Univ., Durham. Dept. of Civil Engineering.
K. M. Stewart.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-110363, Price codes: A04 in paper copy, A01 in microfiche. Master of Science, 1978. 62 p, 5 Fig, 8 Tab, 14 Ref, 3 Append. Plan 'B' Paper. OWRT-A-048-NH (1), 14-34-0001-8031.

Descriptors: *Water treatment, *Chemical analysis, *Organic compounds, *Chlorination, New Hampshire, Separation techniques, Finished water, Raw water, *Trihalomethane, *Chloroform, *Bromodichloromethane, Liquid-liquid extraction, Synthetic organic chemicals, Carcinogens, Durham(NH).

This study quantified the levels of chloroform and bromodichloromethane in the finished water from the water treatment plant in Durham, New Hampshire and investigated the effects of temperature, contact time, and point of chlorination on the levels of these compounds found in the finished water. Finished water samples were collected during April 1978, stored under controlled conditions and analyzed for trihalomethanes by gas chromatography utilizing the liquid-liquid extraction technique. Test results indicated that while the raw water contained no detectable trihalomethanes, chloroform was present in the finished water in concentrations ranging from 9 mg/1 to 170 mg/1 depending upon storage temperature, contact time, and point of chlorination. Bromodichloromethane was also present in the finished water but at very low concentrations (2 - 10 mg/1). Dibromochloromethane and bromoform were not detected. Reductions of average total trihalomethane concentrations as high as 27% were achieved by simply changing the point of chlorination from raw water to settled water.

RAPID DETERMINATION OF BACTERIAL WATER QUALITY THROUGH IMPROVED COLIFORM TEST PROCEDURES,
Northern Arizona Univ., Flagstaff. Dept. of Microbiology.
H. K. Speidel.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-113060, Price codes: A02 in paper copy, A01 in microfiche. Completion Report, September 1980. 10 p. OWRT-A-093-ARIZ(1), 14-34-0001-9003.

Group 5A—Identification Of Pollutants

Descriptors: *Coliforms, *Water analysis, *Analytical techniques, *Testing procedures, Water quality, Aquatic bacteria, Microbiology, Sewage bacteria, Microorganisms, E. coli, Gas chromatography, Alcohols, Testing, Laboratory tests, Quality control, Membranes, Filtration.

Several innovative methods were investigated as potential rapid methods for the determination of coliform bacteria in domestic water. A literature survey and laboratory experiments were conducted to critically evaluate the limitations of current membrane filtration methodology for the determination of total coliform bacteria. Several approaches were made to develop media with improved selection/differentiation properties. Tergitol agar, not recommended for recreational water analysis, may be useful for potable water evaluations due to its desirable recovery characteristics. Bromthymol blue produced detectable coloration of colonies grown in six hours of incubation, but low reliability of differentiation between coliform and non-coliform colonies was observed. Finally, a gas chromatographic analysis method was examined, based on the determination of ethanol from ethanol-producing coliform bacteria in water. The method was found to be applicable to the determination of ethanol-producing coliform bacterial concentrations ranging from 2-2000 organisms per 100 ml of water within 12 hours of culture incubation. While the methods studied are not sufficient to substitute for conventional coliform assays, further work and refinement of innovative approaches was encouraged in order that a more rapid determination of bacterial water quality might be attained. RAPID ANALYSIS OF ORGANIC POLLUTANTS IN SURFACE WATERS BY HIGH-PRESSURE LIQUID CHROMATOGRAPHY,
Wisconsin Univ.-Madison. Water Resources Center.
K. Huibregtse, and J. M. Harkin.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-116881, Price codes: A03 in paper copy, A01 in microfiche. Technical Report WIS WRC 80-08, 1980. 32 p, 16 Tab, 9 Ref. OWRT-A-069-WIS(2), 14-34-0001-6052, 14-34-0001-7105, 14-34-0001-7106.

Descriptors: Pollutants, *Organic compounds, *Chromatography, Analytical techniques, *Water analysis, Water pollution sources, *Surface waters, Analysis, *Pollutant identification, Chemistry, Evaluation, Estimating, Instrumentation, Research and development, Testing, Testing procedures, Chemical analysis, Graphical analysis, Water pollution, Assay, Sampling, Water sampling, Correlation analysis.

A procedure was developed for the concentration and separation of nonpolar organic compounds from water samples using reversed-phase high-pressure liquid chromotography (HPLC) with trace enrichment. Using this procedure, a filtered water sample (30-1000 ml) was passed through an HPLC precolumn containing Porasil C-18, which was then coupled to a high-efficiency micro-Bondapak C-18 analytical column for HPLC separation and fingerprinting of the concentrated aqueous organics. An alternate method, used for fingerprinting of organics associated with suspended sediments, used a vacuum aspirator to pass unfiltered river bottom water samples through a teflon Poracil C-18 cartridge containing end filters, with dissolved organics concentrated on the C-18 and particulate/colloidal-bound organics on the filters. HPLC fingerprints were obtained on samples collected from various waterways, and fingerprint comparisons were made by determining the percentage of peaks present in one chromatogram that were also present in another. A high percent similarity indicated little change occurred in river flow quality between two sample collection points; a low percent similarity indicated major changes in waterway organics, suggesting influx of contaminants from a point source. Analysis of river bottom sediment samples was recommended over conventional water samples to locate the source of a large hazardous chemical spill. (Zielinski-IPA)

SOURCES AND BEHAVIOR OF NATURAL RADIOACTIVITY IN FALL LINE AQUIFERS NEAR LEESVILLE, SOUTH CAROLINA,
South Carolina Univ., Columbia.
J. Michel, and W. Moore.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-116840, Price codes: A05 in paper copy, A01 in microfiche. Water Resources Research Institute, Clemson University, Clemson, South Carolina. Technical Report No 83, Februar, 1980. 73 p, 17 Fig, 11 Tab, 46 Ref. OWWR-B-116-SC(1), 14-34-0001-8115.

Descriptors: *Radium radioisotopes, *Radioactivity, *Isotope studies, *Water pollution sources, *Aquifers, *Groundwater, Water pollution treatment, Radioisotopes, Radiochemical analysis, Soil contamination, Radioactive wastes, South Carolina, Background radiation, Groundwater reservoirs, Water quality, Water management(Applied), Groundwater management, Potable water, Environmental control, Radioactivity effects, Water quality standards.

This project sought to determine the sources, behavior and controls of the radioactive Ra-226 and Ra-228 content of groundwater along the Fall Line of South Carolina; to understand the mechanisms for groundwater acquisition of radium; and to identify the sources and mode of occurrence of the uranium and thorium materials in the aquifer sediments. Groundwater from the Coastal Plain aquifers along the Fall Line near Leesville, South Carolina, had unexpectedly high radium activities, with Ra-228 an important part of the total, a Ra-226 content varying from 3.5-23.0 pCi/liter a radium 228/226 activity ratio among Leesville city wells from 0.23-3.0 (constant for a single well over time), and a total radium content of these wells from 10.8-29.7 pCi/liter. The high Ra-228 may affect the EPA interim drinking water standards for radium. Manganese-impregnated fibers can be used for technically/economically feasible treatment for radium isotopes removal. High Rm-222 was observed, 250-7750 pCi/liter, in Piedmont rock well groundwaters, suggesting a potential health hazard from high radon by out-gassing at the faucet. It is concluded that, while sufficient groundwater exists for doubling the present groundwater use by Leesville, groundwater treatment must be exercised for radium removal or dilution. A RE-EVALUATION OF LEAD-210 CHRONOLOGY AND THE HISTORY OF TOTAL LEAD INFLUX IN A SMALL SOUTH BELGIAN POND,
Liverpool Univ. (England). Dept. of Geography.
F. Oldfield, P. G. Appleby, and D. Petit.
Ambio, Vol 9, No 2, p 97-99, 1980. 4 Fig, 1 Tab, 21 Ref.

Descriptors: *Lead, *Lake sediments, *Dating, *Mathematical models, *Pollutant identification, History, Pollutants, Water pollution, Analytical techniques, Graphical analysis, Bottom sampling, Sampling, Cores, On-site data collection.

Recent sediments from Lake Mirwart, south Belgium were studied along with sediments from other lakes in Northern Ireland, New Guinea, and Finland by stratigraphic and radiometric means to evaluate a model of lead-210 dating at the site. This model is based on the assumption of a constant net rate of supply of unsupported lead-210 to the sediment despite variations in dry mass sedimentation rates within and between cores. Changes in lead concentration and net flux to the sediment from about 1890 AD were calculated by applying the age/depth curves and sedimentation rates derived from the model to stable isotope lead analyses from three Lake Mirwart sediment cores. A dramatic acceleration was found in anthropogenic lead flux during the present century with an especially sharp increase from about 1950 on. These findings were compared with sedimentary and botanical records of lead pollution history from Lake Michigan and southern Scandinavia. It was concluded that lead-210 dating in appropriate situations may provide support for pollution calculations. (Baker-FRC)

SAMPLING PROGRAMME DESIGN FOR WATER QUALITY IN DISTRIBUTION,
Yorkshire Water Authority (England). Office of Scientific Services.
C. S. Short.
Water Services, Vol 84, No 1014, p 529-530, 533-534, 537, August, 1980. 3 Fig, 4 Tab, 1 Ref

Descriptors: *Water quality, *On-site data collection, *Water analysis, *Sampling, Optimization, Statistical methods, Water distribution(Applied), Management, Methodology, Frequency analysis, Domestic water, Project planning, Potable water, Design

A procedure for the design of a potable water supply sampling program is proposed, based on identification of management needs and cost-effective use of scientific resources. The program includes statistical analysis of data at the inception of sampling in order to minimize the total amount of samples required and to achieve randomness in the selection of samples. Mathematical treatment of the data includes fitting an appropriate frequency distribution and determining the precision required to meet management-defined objectives. Formulas for computing number of samples and confidence levels are presented. A reporting format for parameters with short-term variations such as turbidity and pH is presented. The procedure was developed in a pilot program. (Titus-FRC)

WATER QUALITY TRANSFORMATIONS AND GROUNDWATER RECHARGE OF SEWAGE EFFLUENT RELEASES IN AN EPHEMERAL STREAM CHANNEL,
Arizona Univ., Tucson. Dept. of Civil Engineering.
S. Ince, R. A. Phillips, and L. G. Wilson.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-112724, Price code: A02 in paper copy. Project Completion Report, 1980, 20 p, 7 Fig, 5 Tab, 7 Ref OWRT A-051-ARIZ (2), 14-31-0001-5003

Descriptors: *Ephemeral streams, *Open channel flow, *Physicochemical properties, *Groundwater recharge, Southwest U.S., Sewage effluents, Path of pollutants, Water quality, Streamflow, Flow rates, Arizona, Santa Cruz River(AZ)

Bio-physicochemical measurements were made on treated sewage effluent releases at established locations within the channel of an ephemeral stream, the Santa Cruz River of Southern Arizona. Water samples were taken in chronological sequence as the effluent moved downstream, to trace changes in quality parameters during low and high hydrograph stages. Results indicate that dissolved

oxygen (DO) concentrations at low effluent flows were higher than DO concentrations at high effluent flows; while, conversely, biochemical oxygen demand (BOD) concentrations at low effluent flows were generally lower than BOD concentrations at high effluent flows. Biochemical oxygen demand concentrations are affected by waste loadings, flow conditions, phytoplankton growth and nitrification. Mean river deoxygenation rates (kr) in sewage flows after six river miles from the Tucson Sewage Treatment Plant were always negative or increasing, indicative of nitrification, algal growth, and concentration of organic constituents through seepage losses.

WATER DISTRIBUTION AND MOVEMENT IN AN UNSATURATED PIEDMONT SOIL PROFILE,
Clemson Univ., SC. Dept. of Agricultural Engineering.
J. T. Ligon, T. V. Wilson, J. F. Allen, T. G. King, and U. P. Singh.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-113995, Price codes: A06 in paper copy, A01 in microfiche. Water Resources Research Institute, Clemson University Report No 82, 1980, 103 p, 44 Fig, 4 Tab, 28 Ref, 3 Append. OWRT-A-023-SC (9).

Descriptors: *Unsaturated flow, *Soil moisture, *Tritum, Radioactive tracers, Percolation, Water table, *Soil water movement, Groundwater recharge, Tracers, Model studies, Seepage, Root zone, Soil types, *Path of pollutants, Piedmont, South Carolina.

The purpose of the study was to further investigate the deep seepage - groundwater recharge phenomenon, to develop models of the deep seepage process and to examine moisture displacement in the profile as it relates to the transport of pollutants from the soil surface downward to the groundwater. The study consisted of field investigations and model development. Field investigations include soil moisture and water table measurements, observations of surface runoff and interflow, and a radioactive tracer study. Two computer programs were written using the IBM simulation language CSMP. In one, called the Root Zone Model, precipitation and temperature data are used to estimate runoff, evapotranspiration and storage in the root zone. Any excess moisture is considered to perculate below the root zone as deep seepage. The second program, called the Deep Seepage model, uses the deep seepage calculated in the Root Zone Model and simulates its movement through the unsaturated zone to the pheatic surface, at a depth of 20m. In general, the Root Zone Model performed well, while the results of the Deep Seepage Model were biased towards an underestimate of the volume of moisture in the profile.

GREAT BLUE HERONS AS ENVIRONMENTAL INDICATORS: ASPECTS OF FORAGING ECOLOGY,
Ohio Cooperative Wildlife Research Unit, Columbus.
G. A. Grau, and R. Parris.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-113979, Price codes: A04 in paper copy, A01 in microfiche. Water Resources Center, Ohio State University Project Completion Report No RF 760851-710800, June, 1980. 69 p, 16 Fig, 17 Tab, 51 Ref. OWRT-A-049-OHIO(1).

Descriptors: *Migratory birds, *Animal behavior, *Migration patterns, *Distribution patterns, *Lake Erie, Environmental gradient, Movement, Wading birds, Biorhythms, Migration, Nesting, Wildlife, Birds, Spatial distribution, Temporal distribution, Evaluation, *Great Blue Herons, Environmental indicators, Food chains.

A determination of the amount of seasonal and yearly variation in feeding site locations and the amount of overlap in feeding site locations for herons from the various southwestern Lake Erie region colonies was sought. Ten major feeding locations of Great Blue Herons were determined during this February-August 1977 and March-August 1978 study. Factors affecting heronry stratification, individual heron feeding sites, heron movement behavior, aggressive behavior at the feeding site, and heron populations at sites were included. Flight directions from all colonies were similar since most heron flights were contained within a few flight directions. Flight line patterns for the colonies were relatively constant over the season and between years, suggesting an overall fixed use of feeding areas. Although feeding sites for Sandusky Bay heron colonies overlap, herons of smaller colonies tended to avoid use of marshes around the larger colony. Herons from heronry sections used different flight directions to feeding areas, and flock members leaving the heronry tended to be from the same section; but flock members did not always feed in theme area. Further, the amount of time spent at the feeding sites varied greatly. (Zielinski-IPA)

MICROBIAL TRANSFORMATION OF KEPONE,
Maryland Univ., College Park. Dept. of Microbiology.
S. A. Orndorff, and R. R. Colwell.
Applied and Environmental Microbiology, Vol 39, No 2, p 398-406, February, 1980. 5 Fig, 1 Tab, 25 Ref. OWRT-B-034-MD(1).

Descriptors: *Halogenated pesticides, *Microbial degradation, Chemical analysis, *Marine microorganisms, *Waste water treatment, Pseudomonas, Public health, Organic pesticides, Pesticides, Toxins, Metabolism, Biotransformation, Virginia, Water pollution, Gas Chromatography, Mass spectrometry, Chlorinated hydrocarbons, Microbiology, Water pollution sources, Sewage bacteria, Microorganisms, *Kepone, *James River(VA).

Mixed bacterial cultures and a pure culture of Pseudomonas aeruginosa strain K03 were obtained by enrichment culture of water samples collected from the sludge lagoon at the waste water treatment plant at Hopewell, Virginia, where Kepone production had contaminated the James River to the mouth of the Chesapeake Bay. The K03 strain and an isolated mixed aerobic enrichment culture aerobically transformed the toxic chlorinated pesticide Kepone to monohydro-Kepone (MHK). Verification of the transformation was made by analysis of extracts by gas chromatography with electron capture detection, and gas chromatography coupled to electron-impact mass spectrometry. The K03 strain and the isolated mixed culture also produced about 16% and 4%, respectively, of dihydro-Kepone, as determined by co-chromatography using authentic standards. When compared to the pure and mixed cultures, reduced amounts of MHK were produced by James River sediment microorganisms. Kepone was not useable as a sole source of carbon/energy by any of the bacteria or mixed cultures studied. Kepone concentrations found in Baileys Creek sediment entering the James River was about 1000-2000 parts per million, comparable to that reported by the U.S. Environmental Protection Agency, mostly associated with organic matter and colloidal particles. (Zielinski-IPA)

RESULTS OF WATER QUALITY SAMPLING NEAR RICHTON, CYPRESS CREEK, AND LAMPTON SALT DOMES, MISSISSIPPI,
Geological Survey, Jackson, MS. Water Resources Div.
L. A. Gandl, and C. A. Spiers.
Available from OFSS, Box 25425, Fed. Ctr., Denver, CO. 80225, Paper copy $5.25, Microfiche $5.00. Geological Survey Open-File Report 80-443, 1980. 18 p, 5 Fig, 4 Tab, 8 Ref.

Descriptors: *Water quality, *Sampling, *Surface waters, *Groundwater, *Mississippi, Chemical analysis, Chlorides, Path of pollutants, Hydrogeology, Aquifer characteristics, Radioactive wastes, Underground waste disposal, Evaluation, *Mississippi salt-dome basin, Salt domes.

In the Mississippi salt basin in southern Mississippi, chemical quality studies of surface water and ground water have been made to determine present water-quality conditions near three salt domes being studied by the Department of Energy as potential repositories for radioactive wastes. Chloride concentrations in excess of 60 milligrams per liter in surface water and ground water in Perry County indicate that contamination could be occurring from industrial wastes, oil test wells, or dissolution of Richton or Cypress Creek domes. THE EFFECTS ON GROUNDWATER FROM SEEPAGE OF LIVESTOCK MANURE LAGOONS,
Clemson Univ., SC. Dept. of Agricultural Engineering.
R. O. Hegg, T. G. King, and T. V. Wilson.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-115180, Price codes: A05 in paper copy, A01 in microfiche. Water Resources Research Institute, Clemson University Technical Report No 78, September 1979. 47 p, 19 Fig, 3 Tab, 11 Ref, 1 Append. OWRT-B-091-SC(1).

Descriptors: *Groundwater, *Surface-groundwater relationships, *Water pollution, *Livestock, *Farm lagoons, Lagoons, Water quality, Subsurface waters, Dug wells, Groundwater availability, Groundwater resources, Hydrology, Soil water, Underground streams, Water wells, Farm wastes, Test wells, Shallow wells, Water pollution effects.

Three anaerobic swine lagoons in the Southern Coastal Plain of South Carolina were monitored for two years to determine the effects of lagoon seepage on the groundwater. A series of shallow monitoring wells were installed at each lagoon, mostly on the down-gradient side of the lagoon, in a grid pattern. Analyses on well water samples covered temperature, pH, nitrate nitrogen, specific conductance, coliform bacteria, chloride, COD, total organic carbon, ammonia nitrogen, and total kjeldahl nitrogen. Well water table depth, and water consumption were also measured. Most wells showed no discernable trends of changing water quality, but wide variations in the water quality parameters measured were noted. Since most wells were unaffected, non-heterogeneous soil conditions appeared to exist. Subsurface lagoon seepage was impossible to quantitate since only a small number of wells were used, but a water budget compiled for one lagoon indicated an average lagoon leakage rate of 665 liters/day. Lagoon leakage was detected for wells 6 feet from the lagoon, but no groundwater pollution was noted in wells 46 feet away. Use of a larger number of wells was recommended to improve assessment accuracy for subsurface conditions due to soil inhomogeneity. (Zielinski-IPA)

THE INFLUENCE OF URBANIZATION ON THE AQUEOUS TRANSPORT AND DISTRIBUTION OF HEAVY METALS IN THE SADDLE RIVER,
Rutgers - The State Univ., New Brunswick, NJ. Dept. of Environmental Science.
W. G. Wilber.
Ph.D. Dissertation, May, 1978, 356 p, 59 Fig, 66 Tab, 107 Ref, 3 Append. OWRT-A-050-NJ(2), 14-34-0001-8032.

Descriptors: *Heavy metals, *Water pollution sources, *Sediment distribution, *Path of pollutants, *New Jersey, *Saddle River(NJ), Chemical wastes, Sediment yield, Precipitation, Lead, Copper, Zinc, Stormwater, Urban runoff, Street sweeping.

A study of heavy metals was conducted on a highly developed stretch of the Saddle River near Lodi, New Jersey. The major contributors of heavy metals in stormwater runoff were lead, zinc, and copper. An average of 66 percent of the total suspended solids for three storms studied could be removed after four hours of settling. Unlike the other metals, copper was found predominantly in the soluble plus colloidal fraction of runoff. Relative concentrations of metals in precipitation as compared to those of stormwater were relatively insignificant. Street sweeping samples were also analyzed. Statistical analyses were made relating metals occurrence in water to various related parameters. Concentrations of heavy metals in sediments were variable, but increased passing through the highly developed areas. (Whipple-NJ)

MODIFIED FICKIAN MODEL FOR PREDICTING DISPERSION,
Missouri Univ.-Columbia. Dept. of Civil Engineering.
H. Liu, and A. H. D. Cheng.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 106, No HY6, Proceedings Paper 15454, p 1021-1040, June 1980. 8 Fig, 3 Tab, 29 Ref, 2 Append. OWRT-A-103-MO(3).

Descriptors: *Dispersion, *Pollutants, *Path of pollutants, *Model studies, Mathematical models, Water pollution, Rivers, Streams, Flow, Forecasting, Oil spills, Chemicals, Accidents.

The ordinary Fickian model for longitudinal dispersion was modified by using a time or distance dependent dispersion coefficient with a time-scale much greater than the Fischer time scale. From the three bulk flow properties, shear velocity, cross-sectional area, and mean depth of stream, the asymptotic dispersion coefficient, longitudinal dispersion coefficient, and the peak concentration maximum or peak concentration in natural streams can be predicted within a factor of 2.5 and 1.6, respectively. The model is useful for the prediction of longitudinal spread of pollutants in rivers over both short and long distances. (Sims-ISWS)

DIURON LOSS FROM A SMALL WATERSHED IN THE HIGH WINTER RAINFALL ZONE OF WESTERN OREGON,
Oregon State Univ., Corvallis. Dept. of Soil Science.
J. Hickman, M. Montgomery, and M. Harward.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-113334, Price codes: A02 in paper copy, A01 in microfiche. Project Completion Report, September 15, 1980. 10 p, 3 Tab, 4 Ref. OWRT-A-048-ORE(1).

Descriptors: *Herbicides, *Agricultural runoff, Rainfall-runoff relationships, *Small watersheds, Storm runoff, *Mathematical studies, Pesticides, Runoff, Watersheds, Farms, Agricultural watersheds, Agriculture, Crops, Rainfall, Stormflow, Average runoff, Cloudbursts, Direct runoff, Statistical methods, Graphical analysis, Analytical techniques, Gas chromatography, Metabolism, *Path of pollutants.

The herbicide, 3-(3,4-dichlorophenyl)-1)-1,1-dimethyl urea (diuron), was determined in selective runoff samples during storm hydrographs on a 5.1 ha watershed (slopes 3-12%). The watershed was located in southern Polk County about 3 miles south of Monmouth, Oregon. Pre-emergence application of diuron was made at 1.8 kg (active ingredient) per ha to fall-planted winter wheat in late October 1978, about two weeks after planting. Surface runoff from the watershed was measured in a flume, and integrated suspended sediment samples were taken. Following solvent separation of the herbicidally-inactive diuron metabolite, 3,4-dichloroaniline, from the diuron residue, the latter was hydrolyzed to 3,4-dichloroaniline, and its benzene extract analyzed by gas-liquid chromatography with microcoulometric detection. The assay method was sensitive to less than one microgram in a total sample extract. Total diuron loss in the five-month period following application was 0.016 kg/ha, or 0.9% of the total diuron applied. Two major runoffs in early February accounted for 45% of total herbicide loss. A power curve comparing suspended sediment analysis (ppm) against diuron concentration (ppb) was used to calculate total diuron loss from each storm event. The peak herbicide concentration was 80 ppb during the first runoff event, 45 days after application. (Zielinski-IPA)

DEGRADATION OF SELECTED HERBICIDES BY AQUATIC MICROORGANISMS,
Clemson Univ., SC. Dept. of Microbiology.
P. A. Ellis, N. D. Camper, and J. M. Shively.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-113326, Price codes: A03 in paper copy, A01 in microfiche. Water Resources Research Institute Clemson University. Technical Report 84, February, 1980. 36 p, 11 Fig, 11 Tab, 49 Ref, 2 Append. OWRT-A-041-SC(1), 14-34-0001-9043, 14-34-0001-8043, 14-34-0001-7086.

Descriptors: *Herbicides, *2,6-Dichlobenil, *Metabolism, *Aquatic bacteria, *Biodegradation, *Aquatic fungi, *Pollutant identification, Microorganisms, Aquatic microorganisms, Microbial degradation, Fungi, Ponds, Microbiology, Chromatography, Pollutants, Water pollution, Water pollution sources, Pesticide residues, Analysis, Chemical analysis, Assay, Testing procedures.

Degradation of 3-(3,4-dichlorophenyl)-1,1-dimethylurea (diuron) herbicide by pond water and pond sediment microorganisms was studied to assess the degradative pathway. An enrichment procedure was used to isolate microorganisms capable of degrading diuron and, while no such isolate could degrade diuron in pure culture, several mixed fungal/bacterial and mixed bacterial isolated cultures could either partially/totally degrade this herbicide. Studies using radiolabeled diuron (C-14 carbonyl group), mixed culture degradation, and analysis by thin-layer chromatography (TLC), showed that 24-28 day incubation with a mixed fungal/bacterial culture and mixed bacterial cultures gave 78-98% degradation (7 products) and 67-99% degradation (6 products), respectively. The mixed fungal/bacterial culture liberated carbon dioxide as 74-96% of the carbonyl label. TLC analysis indicated the major product formed by most cultures was 3,4-dichloroaniline. Detection of the demethylated derivatives, 3-(3,4-dichlorophenyl)-1-methyl urea and 3-(3,4-dichlorophenyl) urea, suggested a stepwise demethylation of diuron occurred. Similar studies with 2,6-dichlorobenzonitrile (dichlobenil) herbicide showed degradation products of 2,6-dichlorobenzoic acid and 2,6-dichlorobenzamide. (Zielinski-IPA)

Descriptors: *Thermal pollution, *Flow, *Stratified flow, *Thermal water, *Measurement, Computer models, Mathematical models, Jets, Surfaces, Turbulence, Temperature, Velocity, Reynolds number, Diffusion, Heat flow, Research equipment.

Laboratory studies of heated water jets were undertaken to model real-life discharges by thermal power plants. Thermal pollution can be controlled if there can be an accurate prediction of the water temperature and velocity distribution in the disposal area. A Laser-Doppler Velocimeter (LDV) system was developed to measure the velocity of the heated jets without the use of dyes or floating objects. The thermally stratified surface jets were analyzed at a particular Richardson Number and Reynolds Number. The turbulent entrainment of temperature stratified flows was also measured and the range of Reynolds numbers was quite narrow and the mixing coefficients were found to only be functions of the local Richardson number. Dye injection studies gave the centerline trajectories and plume widths by varying the four dimensionless parameters: Richardson number, velocity ratio, channel width, and jet aspect ratio. A numerical model was developed for predicting the behavior of a heated surface jet as it penetrates a quiescent body of water. The model uses the two equation K-epsilon turbulence model including bouyancy effects. Stability problems in the turbulence portion of the calculations gave anomalies such as overpredicted centerline temperatures far from the discharge point and under-prediction for the lateral spread of the jets for small values of the initial Richardson number. THE BALTIC SYSTEMS OF MAN AND NATURE. A PERSPECTIVE FOR THIS ISSUE,
B.-O. Jansson.
Ambio, Vol 9, No 3-4, p 112-113, 1980. 1 Fig, 2 Ref.

Descriptors: *Water pollution, *Natural resources, *Water resources, *Environmental effects, *Oceans, Mine wastes, Municipal wastes, Industrial wastes, Water circulation, Marine fish, Sands, Fossil fuels, Urbanization, Planning, Waste water, Sea water, Baltic Sea, Water pollution control.

This introduction to a series of articles on the Baltic stresses the interrelationships between natural and man-made systems in this area. Natural

systems, including climate, inflowing water from rivers and from the North Sea, fish, and mineral products, are impacted by human exploitation and by the production of wastes, both water- and airborne. Wastes are the products of urban and industrial systems, such as the food industry and the exploitation of minerals. The use of fossil fuel has resulted in the introduction of nutrients but also of hazardous substances into the waste water flow. In the Baltic area, both governmental and non-governmental organizations are concerned with the scientific use of the Sea. Several conventions for protecting the Baltic from pollution have been agreed upon by its seven bordering states. (Gish-FRC)

POLLUTION FROM INDUSTRIES IN THE DRAINAGE AREA OF THE BALTIC,
Swedish Water and Air Pollution Research Lab., Stockholm.
L. Bruneau.
Ambio, Vol 9, No 3-4, p 145-152, 1980. 8 Fig, 8 Tab, 14 Ref.

Descriptors: *Industrial wastes, *Agricultural runoff, *Pulp wastes, *Pollutants, *Water pollution control, Baltic Sea, Oceans, Water pollution, Rivers, Lignins, Nitrogen, Phosphorus, Organic wastes, Copper, Fertilizers.

Pollution in the Baltic Sea by industrial activities in surrounding countries is reviewed. Possible ways in which the ever-increasing level of pollution can be monitored and eventually reduced are considered. The largest consumer of water among the industries in this region is the pulp and paper industry. Scandinavian countries have reduced the pollution from this industry, but there are still severe problems. Specific industrial problems are discussed for the Bothnian Bay area, the Bothnian Sea, the Gulf of Finland, the Gulf of Riga, and the Baltic itself. Estimated discharge figures in kilotonnes/yr are 0.006 (via rivers) for copper, 4.8 (57.4 via rivers) for nitrogen, 1.4 (0.76 via rivers) for phosphorus, 571.6 for lignin and 343.5 (201.5 via rivers) for BOD7. Estimates for chlorinated phenolic compounds are also given. Primary means of reducing pollution in this area of concern are noted. The most dramatic improvements in BOD and lignin discharge came about in the middle 1940s with the development of a process for evaporation and burning of sulfite liquors. Most of the improvements have been made in Sweden, with the other countries lagging behind. (Baker-FRC)

DEPOSITION OF AIRBORNE POLLUTANTS ON THE BALTIC,
Stockholm Univ. (Sweden). Meteorologiska Institutionen.
H. Rodhe, R. Soderlund, and J. Ekstedt.
Ambio, Vol 9, No 3-4, p 168-173, 1980. 2 Fig, 8 Tab, 37 Ref.

Descriptors: *Precipitation, *Air-water interfaces, *Pollutants, *Water pollution sources, *Air pollution effects, Baltic Sea, Organic compounds, Nitrogen compounds, Lead, DDT, Polychlorinated biphenyls, Air pollution, Oceans.

The pollution of the Baltic Sea by airborne pollutants is considered with emphasis on the deposition process. Downward transport across the air-sea interface may be divided into wet deposition (fallout in precipitation) and dry deposition (gravitational setting, transport by turbulent eddies, molecular diffusion, and impaction by inertia). Deposition rates for a number of pollutants are given, suggesting that atmospheric deposition is a major source of nitrogen compounds (120,000-1.3 million tons/yr) and lead (600-5,000 tons/yr) in the contaminated Baltic Sea area. A meteorological study of the area indicates that the turnover time for water in the Baltic Sea is about 15 yr. Surface waters have a normally shorter residence time. Concentration data is provided for inorganic nonmetals, metals, radionuclides, and organic compounds in the Baltic Sea. The deposition of DDT and polychlorinated biphenyls in various areas of Sweden varies from 960 to 2,120 and 1,400 to 1,780 ng/sq m/month, respectively. Estimates of the annual flux of a number of pollutants from the atmosphere to the Baltic Sea have been calculated from the methods and data presented. (Baker-FRC)

EFFECT OF SALINITY ON METHYLATION OF MERCURY,
Cook Coll., New Brunswick, NJ. Dept. of Biochemistry and Microbiology.
J. E. Blum, and R. Bartha.
Bulletin of Environmental Contamination and Toxicology, Vol 25, No 3, p 404-408, September, 1980. 1 Fig, 17 Ref.

Descriptors: *Salinity, *Mercury, *Estuarine environment, *Marine microorganisms, Inorganic compounds, Sediments, Anaerobic conditions, Incubation, Laboratory tests, Analytical techniques, Freshwater, Saline water.

The effects of salinity on microbial methylation of inorganic and phenylmercury compounds to mono- and dimethylmercury were evaluated utilizing sediments from an estuarine environment. Sediment samples collected from the Cheesequake Creek in New Jersey were slurried with water from a freshwater pond in a sediment to water ratio of 2:1 and then mixed with sea salts to achieve the desired salinity. To the slurry was added 10 ppm mercury as HgCl2; some samples were mixed with 0.2% NaN3 to suppress microbial methylation. Analysis of the samples indicated that the rate and extent of microbial methylation of mercury ions in anaerobically incubated estuarine sediment samples occurred in an inverse relationship to salinity, with methylation performed most rapidly at the lowest salinity of 0.1%. Methylmercury concentrations decreased after 15-20 days of incubation, and these decreases were attributed to microbial demethylation. Further studies on mercury methylation in freshwater and salt water were recommended. (Lisk-FRC)

ACCIDENTAL CHEMICAL SPILLS. A REVIEW OF INCIDENTS IN THE OHIO RIVER VALLEY, 1978 AND 1979,
R. C. Kroner.
Public Works, Vol 111, No 10, p 48-50, October, 1980. 1 Fig, 5 Tab.

Descriptors: *Ohio River, *Chemical wastes, *Accidents, *Water law, Law enforcement, Water pollution, Industrial wastes, Rivers, Organic wastes, Inorganic compounds, Oil pollution, Oil wastes, Sewage, Legislation, Water pollution control.

Information from reports on chemical spills filed with the Ohio River Valley Water Sanitation Commission according to federal law is presented in an attempt to acquaint the public with the spectrum of industrial materials which are escaping into the waterways of the Ohio River Valley. While it is acknowledged that merely cataloguing such incidents will not abate their occurrence, a periodic review of these happenings will indicate additional precautions and legislation that will aid in reducing their occurrence in the future. In 1978, a total of 150 spills was reported. In 1979, 161 such spills were reported. In the 2-yr period, there were more than 100 petroleum product spills, usually in the range of < 100 to 1,000 gallons, though one loss in 1979 was of 45,000 gallons. Other spills in 1979 included raw sewage (30 million gallons), industrial waste mixtures (phenol, cyanide, oil, and greases, 36 million gallons; chlordane-hexachloropentadiene, 0.5 million gallons), formic acid - hydrochloric acid (0.19 million gallons), and carbon black (800 barrels). Miscellaneous wastes spilled into the Ohio in 1979 included steel mill sludge, pickle rinse, lime slurry, glass furnace sludge, and paint sludge. Multi-component spills are a common occurrence. Most spills occur in the most heavily industrialized areas, along the north bank of the Ohio along the Ohio state boundary. From Cincinnati to its confluence with the Mississippi, the river is almost spill-free. The number of spills reported by states in 1978 and 1979 ranged from 157 in Ohio to 2 in Illinois. Some reports received by lay people are based purely on visual observations. (Baker-FRC)

EVIDENCE FOR THE DECOUPLING OF DISSOLVED, PARTICULATE AND SURFACE MICROLAYER HYDROCARBONS IN NORTHWESTERN ATLANTIC CONTINENTAL SHELF WATERS,
Energy Resources Co., Inc., Cambridge, MA. Aquatic Sciences Div.
P. D. Boehm.
Marine Chemistry, Vol 9, No 4, p 255-281, August 1980. 7 Fig, 6 Tab, 38 Ref.

Descriptors: *Organic compounds, *Oil pollution, *Continental shelf, *Films, *Sea water, Water sampling, Dissolved solids, Pollutant identification, Gas chromatography, Water analysis, Chemical analysis, Oily water, Sampling.

Various stations set along the Georges Bank area off the New England coast were sampled to determine the seasonal, spatial and depth variations in dissolved, particulate and surface microlayer water. Large spatial and temporal heterogeneity was discovered in the origin of hydrocarbons upon analysis of water column samples by high-resolution gas chromatography. Surface film hydrocarbons were present at higher levels than dissolved fractions. Dissolved fractions were more abundant than particulate hydrocarbons in the water column. Surface film and dissolved hydrocarbons showed slight differences although both were mainly of a petroleum source. Bulk-water particulate was of a mixed biogenic and petrogenic origin. Due to the differences in hydrocarbons found in the surface microlayer and the bulk water, a microlayer enrichment factor was not considered. Hydrocarbons of the surface film, bulk water particulate matter and dissolved hydrocarbons were all decoupled with regard to origin and concentration in the area studied. (Geiger-FRC)

THE BIOGEOCHEMISTRY OF SEDIMENTS IN TWO GULF OF MAINE BASINS,
New Hampshire Univ., Durham. Dept. of Earth Sciences.
W. B. Lyons, M. E. Hines, G. M. Smith, and A. D. Hewitt.
Marine Chemistry, Vol 9, No 4, p 307-320, 1980. 1 Fig, 7 Tab, 60 Ref.

Descriptors: *Biochemistry, *Gulfs, *Maine, *Geochemistry, *Sediments, Analytical techniques, Nitrification, Marine bacteria, Carbon, Sedimentation rates, Sulfates, Denitrification, Water sampling, Sea water.

A preliminary study was made of deeper water continental shelf sediments off the Gulf of Maine Basins. Sediment from Jeffreys Basin exhibited low organic carbon content and low reduced sulfur values. The pore water values indicated that nitrification with subsequent denitrification were the major biogeochemical processes which were occurring in the upper 115 cm of the water. Wilkinson Basin sediments demonstrated higher organic carbon values and higher reduced sulfur and total plate-count bacteria. Thus the major biogeochemical processes occurring in these latter sediments were denitrification with sulfate reduction. The difference in sedimentation rates at the two basins is shown to influence the differences in the rates of the microbially mediated processes found in each basin. (Baker-FRC)

LAND-BASED INPUTS OF SOME MAJOR POLLUTANTS TO THE BALTIC SEA,
International Council for Exploration of the Sea.

Copenhagen (Denmark).
J. Pawlak.
Ambio, Vol 9, No 3-4, p 163-167, 1980. 3 Fig, 4 Tab, 11 Ref.

Descriptors: *Pollutants, *Organic wastes, *Domestic wastes, *Nitrogen, *Phosphorus, Industrial wastes, Water pollution sources, Baltic Sea, Sewage, Rivers, Heavy metals, Polychlorinated biphenyls, Pesticides, Oceans, Agricultural runoff, Nutrients, Pollutant identification.

Some of the major sources of pollutants to the Baltic Sea are discussed. Organized study of the input of pollutants to the Baltic Sea began about 1970 when the International Council for the Exploration of the Sea compiled estimates of domestic sewage and industrial discharge inputs. Currently, the fate of pollutants in the Baltic Sea and their exchange with other pollutants in the North Sea are being studied. Of all the pollutants present, the most reliable estimates for concentration are made of the organic matter and nutrients nitrogen and phosphorus. Sources of organic matter include untreated domestic sewage, effluents from food processing and paper and pulp industries, and humic substances in runoff water from agricultural sites. About half of the organic matter in the Baltic is transported there by the river systems. The annual input of phosphorus to the Baltic Sea is 25,825 tons, while that of nitrogen is 308,890 tons, and that of organic matter (estimated as BOD7) is 1,354,700 tons. Among industrial wastes in the Sea are heavy metals such as mercury, cadmium, lead, chromium, copper, zinc, nickel and iron. Organohalogen compounds such as polychlorinated biphenyls and certain pesticides are also present, along with petroleum hydrocarbons. (Baker-FRC)

THE EFFECT OF CHEMICAL SPECIATION ON THE EQUILIBRIUM, WHOLE-BODY CADMIUM CONTENT OF LARVAE OF THE CADDISFLY, HYDROPSYCHE SP.
North Carolina Univ. at Chapel Hill. Dept. of Environmental Sciences and Engineering.
S. A. Dressing.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-111304, Price codes: A05 in paper copy, A01 in microfiche. MS Thesis, 1980. 88 p, 9 Fig, 19 Tab. OWRT-A-095-NC (2), 14-34-0001-9035.

Descriptors: *Cadmium, Heavy metals, *Aquatic organisms, Cadmium in water, Cadmium in organisms, *Caddisflies, Aquatic insects, Reproduction, Larvae, Toxicity, Testing procedures.

The correlations between heavy metal concentrations in caddisfly larvae and both total cadmium and free cadmium ion concentrations were studied in the laboratory to determine the effect of chemical speciation on the equilibrium cadmium burden of the caddisfly larvae. Nitrilotriacetic acid (NTA) was added to inorganic test media to serve as a chelator. Cadmium in water and test organisms was determined by both graphite furnace atomic absorption spectrophotometry (GFAAS) and conventional flame atomic absorption spectrophotometry (FAAS). Cadmium speciation was calculated by the REDEQL2 chemical equilibrium computer program. Organism cadmium concentration was found to be a function of the total cadmium concentration in the media, not the free cadmium ion concentration. The biological variation inherent in the test organisms was found to be the largest factor limiting the experimental reproducibility, but replicate test systems produced very similar results.

EFFECT OF AGRICULTURAL LAND DEVELOPMENT ON DRAINAGE WATERS IN THE NORTH CAROLINA TIDEWATER REGION,
North Carolina State Univ. at Raleigh. School of Agriculture and Life Sciences.
R. W. Skaggs, J. W. Gilliam, T. J. Sheets, and J. S. Barnes.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-105959, Price codes: A06 in paper copy, A01 in microfiche. Water Resources Research Institute of The University of North Carolina, Raliegh, Report No 159, 1980. 110 p, 49 Fig, 48 Tab. OWRT-B-102-NC (1), 14-34-0001-7174.

Descriptors: *Drainage effects, *Water quality, Water quantity, Agricultural drainage, *Agricultural runoff, Nutrients, Phosphorus, Nitrogen, Pesticides, Soil properties, Rainfall, Water analysis, Soil analysis, Chemical analysis, Tidewater Region(NC).

A three year study was conducted to determine the effects of agricultural drainage and development on hydrology and runoff water quality on high organic soils in the North Carolina Tidewater Region. Experiments were conducted on paired developed and undeveloped sites of three different soils that span the range of soils being developed in the Tidewater Region. Each of the six sites (three developed, three undeveloped) were instrumented to continuously measure the rate of runoff, to sample for water quality and pesticide analyses, and to determine other variables such as rainfall and water table depth. Peak runoff rates occur earlier and are three to four times higher on developed than on similiar undeveloped lands. There is a small but significant increase in inorganic nitrogen in drainage water as a result of agricultural development of these organic rich soils. However, the true organic soils which are developed lose considerably more phosphorus to drainage waters. Development of the mineral soil has a very small effect on phosphorus losses. One potential water quality problem is the movement of fecal organisms from grazed pastures into drainage water.

THERMAL EFFECTS ON PRIMARY PRODUCTIVITY OF PHYTOPLANKTON, PERIPHYTON AND MACROPHYTES IN LAKE KEOWEE, SOUTH CAROLINA,
Clemson Univ., SC. Water Resources Research Inst.
C. R. Dillon, and J. H. Rodgers.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-112435, Price codes: A06 in paper copy, A01 in microfiche. Report No 81, 1980, 115 p, 8 Fig, 8 Tab, Append. OWRT B-053-SC (1).

Descriptors: *Primary productivity, Thermal loading, *Phytoplankton, *Periphyton, Macrophytes, *Thermal pollution, Lakes, *Nuclear powerplants, Environmental effects, Nutrients, Water quality, Aquatic plants, Growth rates, South Carolina, *Lake Keowee(SC).

Productivity of phytoplankton, periphyton and macrophytes at three stations in Lake Keowee was measured from April, 1973 to April, 1975. Average monthly productivity for phytoplankton was 1097.19, 1037.33 and 880.54 mg C m super -2 m0 super -1 at Stations 1, 2, and 3 respectively. Monthly averages of periphyton productivity were 158.63, 108.87 and 211.39 mg C m super -2 mo super -1 for Stations 1, 2 and 3 respectively. Macrophytes occurred only at Station 3. For the fourteen months they were present, macrophytes averaged 660.4 mg C m super -2 mo super -1. Ludwigia palustris (L.) E., and Potamogeton diversifolius Raf., previously unreported from Oconee County, were the only submerged aquatic macrophytes found. From the thermal profiles there tended to be an autumnal turnover. Based on the temperature data, Lake Keowee would be classified as a warm, monomutic lake. Both low nutrient concentrations and low productivity classifies Lake Keowee as an oligitrophic lake. This investigation could demonstrate no significant effect of thermally elevated reactor cooling effluents on the productivity of phytoplankton or periphyton. The occurrence of macrophytes only in the thermally affected area is considered to be an artifact of substrate coupled with the possibility that some additional effect may be realized from water currents generated by pumping action
W81-00038

EFFECTS OF ATRAZINE ON CHESAPEAKE BAY AQUATIC PLANTS,
Auburn Univ., AL. Dept. of Botany, Plant Pathology, and Microbiology.
D. R. Forney.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-115560, Price codes: A05 in paper copy, A01 in microfiche. Master of Science Thesis, August 26, 1980. 86 p, 1 Fig, 13 Tab, 83 Ref. OWRT-A-067-ALA(1)

Descriptors: *Triazine pesticides, *Water pollution effects, *Water pollution sources, *Aquatic plants, *Chesapeake Bay, Pesticides, Chlorinated hydrocarbons, Agricultural runoff, Toxicity, Toxins, Environmental effects, Plant pathology, Halogenated pesticides, Alabama, Water pollution, Plant growth, Growth chambers.

The possibility of atrazine runoff from farmland being involved in the observed decline in submerged plant populations in Chesapeake Bay in recent years, was investigated using growth chamber studies. Dose-reponse studies using elodea and redheadgrass plants grown in jars in nutrient solution containing varying atrazine concentrations showed the 1% growth inhibition concentration level to be a few parts per billion (ppb) atrazine. A somewhat higher atrazine concentration gave a 1% inhibition of Eurasian watermilfoil growth. Atrazine concentrations calculated for 50% growth inhibition were 13 ppb for elodea, 163 ppb for wildcelery, 474 ppb for redheadgrass, and 1104 ppb for Eurasian watermilfoil. While growth of the brackish species wildcelery was inhibited both by salinity and by atrazine, no significant inhibition interaction was observed for these variables. When low atrazine levels were present in both the water and the soil, the water concentration determined the toxic event. Soil concentrations of atrazine less than 1000 ppb had no effect. The study concludes that, from the atrazine concentrations detected in Chesapeake Bay samples, atrazine was not likely to have caused the observed decline of submerged plants in the Bay. LIMNOLOGY OF LAGO LOIZA, PUERTO RICO,
Geological Survey, San Juan, PR. Water Resources Div.
F. Quinones-Marquez.
Geological Survey Water-Resources Investigations 79-97, February 1980. 113 p, 44 Fig, 26 Tab, 48 Ref.

Descriptors: *Limnology, *Water quality, *Lakes, *Puerto Rico, *Eutrophication, Chemical properties, Physical properties, Biological properties, Sediments, Reservoirs, Storage capacity, Hydrologic budget, Bacteria, Dissolved oxygen, Water temperature, Nutrients, Plankton, Hydrologic data, *Lago Loiza(PR).

The principal chemical, physical and biological characteristics of Lago Loize, P.R., and its main tributaries were studied from 1973-74. The lake supplies an average of 300,000 cubic meters per day of water to metropolitan San Juan. Flows from Rio Grande de Loize and Rio Gurabo contribute 84.0 percent of the water, 67.3 percent of the nitrogen, and 66.8 percent of the phosphorus to the lake. About 31 percent of the nitrogen and 45

percent of the phosphorus were retained in the lake, which has a mean flusing rate of 19 times per year. The lake's capacity declines at a rate of about 1.9 percent per year and is about 14.9 million cubic meters. Sewage inputs to the lake's tributaries average 18,560 cubic meters per day. Fecal coliform bacteria in numbers ranging from 100 to 6,700,000 were recorded throughout the tributaries and the lake. In the lake, dissolved oxygen concentration is less than 5.0 milligrams per liter below the 1.5-meter depth. Lago Loize is a hypereutrophic lake, with an average total nitrogen concentration of 1.7 milligrams per liter and 0.33 milligram per liter of total phosphorus. (USGS)

THERMAL STRESS STUDIES ON SELECTED ZOOPLANKTON SPECIES AND AN ISOPOD,
Tennessee Univ., Knoxville. Dept. of Zoology.
D. L. Bunting, and N. J. Cheper.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-115610, Price codes: A04 in paper copy, A01 in microfiche. Water Resources Research Center. University of Tennessee Report No 76, June 1980. 50 p, 6 Fig, 7 Tab, 76 Ref. OWRT-A-049-TENN(1), 14-34-0001-0145.

Descriptors: *Zooplankton, *Thermal pollution, *Water temperature, *Cooling water, *Industrial water, Industries, Industrial wastes, Recirculated water, Industrial plants, Aquatic microorganisms, Aquatic life, Water utilization, Water resources, Water supply, Heat pollution, Heated water, Water pollution sources.

Laboratory determination of temperature stress levels and assessment of their ecological consequences was carried out for selected zooplankton species to develop data for ecological impact associated with industrial use of natural water for cooling. An included literature search revealed substantial fish and benthos data, but little on stress temperature effects on zooplankton. Information was gathered on two cladocerans (Daphnia pulex and Simocephalus exspinosus), four copepods (Mesocyclops edax, Diaptomus reighardi, D. stagnalis, and D. clavipes), and an isopod (Lirceus brachyurus). The time lapse until 95% mortality was determined for D. pulex immatures acclimated at 15 and 25 degrees C, and the lethal temperature causing 50% mortality was determined for adult and immature S. exspinosus acclimated at 15 degrees C and tested at 20, 25, and 30 degrees c. A general trend was observed for the time to mortality to increase with acclimation temperature increase; and for a given acclimation temperature, for mortality time to decrease with increasing test temperatures (25-35 degrees C). Time estimates to 50% mortality for the copepods suggested that intersex tolerance differed at specific temperatures, but, overall, increasing test temperatures decreased survival time. Isopod survival increased with increasing acclimation temperature. Suggested future research included modeling of the effects noted, based on a detailed field study of secondary production. EFFECTS OF AGRICULTURAL DRAINAGE DEVELOPMENT ON BENTHIC INVERTEBRATES IN UNDISTURBED DOWNSTREAM REACHES,
Minnesota Univ., St. Paul.
P. C. Marsh, and T. F. Waters.
Transactions of the American Fisheries Society, Vol 109, No 2, p 213-223, March 1980. 2 Fig, 5 Tab, 25 Ref. OWRT-B-120-MINN(2), 14-31-0001-6091.

Descriptors: *Channel improvement, *Agricultural runoff, *Effects, *Invertebrates, Insects, Benthic fauna, Sediments, Suspended solids, Turbidity, Streams, Runoff, Water chemistry, Water temperature, Dissolved oxygen, Hydrogen ion concentration, Carbon dioxide, Discharge(Water), Streamflow, Sampling, Surveys.

The downstream effects of channelization and agricultural drainage development were evaluated in southwestern Minnesota by comparing benthic invertebrate populations in streams heavily modified by channelization and agricultural drainage development in upstream areas with those not so modified. Physicochemical characteristics, as well as invertebrate populations, were observed in relatively undisturbed downstream reaches. Turbidity, total alkalinity, and timing of discharge were similar in all streams. Species compositions of benthic invertebrates were similar in all streams, and there were no significant differences in total, seasonal, or monthly levels of standing stock in either numbers or biomass between modified and unmodified streams. Invertebrate drift, both insects and total invertebrates, was similar in all streams. Some differences in individual taxa were observed, but these were related to localized differences between streams rather than to drainage development. Specific differences included higher numbers in drift of the snail Physa gyrina and the amphipod Hyalella azteca in one modified stream, apparently the result of more suitable upstream habitat in drainage ditches. It was concluded that, in these agricultural areas, the impact of upstream drainage development on benthic invertebrates in natural downstream reaches was negligible. (Sims-ISWS)
W81-00103

SOURCES AND EFFECTS OF COLOR IN THE WISCONSIN RIVER, WISCONSIN,
Wisconsin Univ.-Stevens Point. Coll. of Natural Resources.
C. Mechenich, B. H. Shaw, and T. S. Roeder.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-113342, Price codes: A04 in paper copy, A01 in microfiche. Water Resources Center, University of Wisconsin, Madison, Technical Report WIS-WRC 80-09, 1980. 52 p, 6 Fig, 9 Tab, 47 Ref, 3 Append. OWRT-A-080-WIS, 14-34-0001-8053, 14-34-0001-9053.

Descriptors: Color, Light, Water quality, Wisconsin, Waste water disposal, Federal Water Pollution Control Act, Light penetration, Algae, *Pulp and paper industry, *Waste water(Pollution), *Color reactions, *Environmental effects, *Wisconsin River.

The Wisconsin River has been extensively used for power production and industrial and municipal wastewater disposal. Man's past uses of the river caused serious water quality problems. However, water quality in the Wisconsin River has substantially improved since the implementation of the wastewater treatments requirements of the 1972 amendments to the Federal Water Pollution Control Act (PL 92-500). Presently, wastewater discharges from the pulp and paper industry, especially during periods of low flow, influence the color of the Wisconsin River. The effect of color and associated effects of light penetration on the growth of algae in Lake Du Bay were investigated. Carbon assimilation rates increased as water color decreased, except for occasional instances of surface inhibition. Changes in carbon (C) assimilation rates varied with depth. Multiple regression analysis indicated that red light penetration was the most significant predictor of C assimilation rate changes. The contribution of industry to true and apparent color of the Wisconsin River appears to lower algal productivity in reservoirs. Further restrictions of industrial discharges without simultaneous reductions in nutrient pollution could cause more severe algal bloom problems than presently exist. Such relationships must be considered seriously in water quality planning and implementation of the provisions of PL 92-500.
W81-00107

INFLUENCE OF 2,4-D AND 2,4,5-T ON LIFE HISTORY CHARACTERISTICS OF CHIRONOMUS (DIPTERA: CHIRONOMIDAE),
Clemson Univ., SC. Dept. of Zoology.
C. F. Sigmon.
Bulletin of Environmental Contamination and Toxicology, Vol 21, p 596-599, 1979. 2 Tab, 11 Ref. OWRT-A-038-SC(2).

Descriptors: *Pollutants, *Aquatic life, *Midges, *Diptera, *2,4-D, *2,4,5-T, *Bioassay, *Lethal limit, *Toxicity, Water pollution sources, Water pollution, Water quality, Water pollution effects, Insects, Herbicides, Mortality, Pesticide residues, Toxins, Population, Inhibitors, Safety, Sewerage, Sewage treatment, Sewers, Agricultural runoff.

This study was designed to examine the effect of the butoxyethanol esters of 2,4-dichlorophenoxyacetic acid (2,4-D) and 2,4,5-trichlorophenoxyacetic acid (2,4,5-T) on pupation, emergence, and mortality in Chironomus sp. Combinations of the herbicide concentrations and temperatures chosen for study were similar to those observed in nature. Chironomus (midges) were collected from a sewage oxidation pond and sorted into three size classes. Ten animals/class were placed in culture dishes with fresh lake water and acclimated under incubation to 20, 25, or 30 degrees, followed by exposure to 1 or 3 ppm (acid equivalent) of either of the two herbicides. The only responses that appeared notable relative to controls were increased larval mortality, and decreased pupation and emergence at 30 degrees for 2,4-D. Although midges adequately withstood the herbicides at lower temperatures, the combined stress of temperature and herbicide was less well tolerated. While lethality studies on aquatic animals related to concerns for agriculture/forest runoff and aquatic weed control involving 2,4-D and 2,4,5-T have been reported, sublethality studies have been scarce. In the present study, control versus treatment differences were not sufficiently great to severely limit organisms such as midges which produce large numbers of eggs. (Zielinski-IPA)
W81-00116

OXYGEN CONSUMPTION IN LEPOMIS MACHROCHIRUS EXPOSED TO 2,4-D OR 2,4,5-T,
Clemson Univ., SC. Dept. of Zoology.
C. Sigmon.
Bulletin of Environmental Contamination and Toxicology, Vol 21, p 826-830, 1979. 2 Tab, 11 Ref. OWRT-A-038-SC(3).

Descriptors: *Herbicides, *2,4-D, *2,4,5-T, *Oxygen demand, *Respiration, *Sunfishes, *Fish behavior, *Water pollution effects, Pesticides, Oxygen requirements, Fish, Fish toxins, Water pollution, Water quality, Environmental effects, Pesticide residues, Mathematical models, Analytical techniques, Gas chromatography, Metabolism, Mathematical studies, Absorption.

Metabolic response was examined soon after exposure to 2,4-dichlorophenoxyacetic acid (2,4-D) and 2,4,5-trichlorophenoxyacetic acid (2,4,5-T) herbicides and short-term uptake by Lepomis macrochirus (bluegill sunfish) was determined. Short time periods were used since herbicides dissipate readily and fish would only be exposed to relatively high concentrations soon after herbicide application. Respiration was measured at 20, 25, and 30 degrees. Herbicide uptake was determined on fish maintained eight days at 20, 25, or 30 degrees in 3 ppm of 2,4-D or 2,4,5-T. A stepwise multiple regression was used to test the importance of herbicides, temperatures, and fish weight in predicting log-transformed respiration. The log transformation allowed comparison with other fish respiration data. Data were consistent with the hypotheses that the response of respiration to weight was independent of temperature. The influence of temperature on respiration was evident from the intercepts with elevated respiration at 30 degrees. More 2,4,5-T than 2,4-D was retained by the fish. Respiration was measured using a closed system and the azide modification of the Winkler technique. Herbicide levels in fish were determined as their methyl esters by analysis of cleaned-up extracts using gas-liquid chromatography with electron capture detection. (Zielinski-IPA)
W81-00117

OXYGEN CONSUMPTION IN DAPHNIA PULEX EXPOSED TO 2,4-D OR 2,4,5-T,
Clemson Univ., SC. Dept. of Zoology.
C. Sigmon.
Bulletin of Environmental Contamination and Toxicology, Vol 21, p 822-825, 1979. 2 Tab, 6 Fig. OWRT-A-038-SC (4).

Descriptors: *Pollutants, *Aquatic life, *Oxygen demand, *2,4-D, *2,4,5-T, *Bioassay, Toxicity, Water pollution sources, Water pollution, Physiological ecology, Water quality, Water pollution effects, Herbicides, Pesticide residues, Agricultural runoff, Toxins, Inhibitors, Safety, Thermal stress, Water temperature, Lakes, Ponds.

The effect of the butoxyethanol esters of 2,4-dichlorophenoxyacetic acid (2,4-D) and 2,4,5-trichlorophenoxyacetic acid (2,4,5-T) on oxygen consumption was studied in Daphnia pulex, an important freshwater animal due to its role as a food chain intermediate in temperature-zone lakes/ponds receiving agricultural runoff. Oxygen consumption is a useful measure of sublethal effects since energy processes serve to indicate the overall physiological activity state. Daphnia were laboratory cultured in pond water and acclimated at 20, 25, or 30 degrees with a 12-hour light, 12-hour dark photoperiod. Daphnia were maintained under incubation for one day prior to respiration measurement at 20 degrees, but were maintained under incubation for several days prior to respiration measurement at 25 and 30 degrees. Herbicide exposure (1 or 3 ppm pondwater solutions) was made shortly before oxygen consumption measurement. While both herbicides appeared to increase respiration at 30 degrees, statistical significance was only achieved for 2,4,5-T (at 3 ppm). Variability in the data was observed. The sharp increase noted for treatment with 3 ppm 2,4,5-T at 30 degrees could have been the result of the net effect of herbicide and temperature, analogous to an earlier proposition for sharp increases in the oxygen consumption-temperature curve for physiological systems. (Zielinski-IPA)

MAN'S IMPACT ON THE BALTIC ECOSYSTEM,
Abo Akademi, Turku (Finland). Inst. of Biology.
E. Leppakoski.
Ambio, Vol 9, No 3-4, p 174-181, 1980. 8 Fig, 3 Tab, 50 Ref.

Descriptors: *Ecosystems, *Balance of nature, *Baltic Sea, *Water pollution effects, *Aquatic life, Oceans, Land use, Eutrophication, Oxygen, Plankton, Water pollution control, Mercury, Heavy metals, DDT, Polychlorinated biphenyls, Aquatic animals, Fish, Water birds, Oil pollution, Water pollution sources, Industrial wastes, Chemical wastes.

Man's activities in the area of the Baltic Sea have resulted in excessive eutrophication and damaging oil spills, as well as contamination with industrial wastes such as heavy metals and toxic substances like polychlorinated biphenyls (PCBs). The biomass of the Baltic area is seriously affected. Changes in species composition have occurred, some being in danger of extinction (e.g. osprey, seals) and some having been introduced to the area (e.g. muskrat, Chinese mitten crab, herring gull). Excess eutrophication speeds up the development of anoxic conditions in stagnating bottom water and in the formation of hydrogen sulfide in the semi-isolated deep basins of the southern and central Baltic, causing heavy blooms of planktonic algae and decreased transparency of the water. Periods of oxygen depletion have been becoming longer and more frequent since the 1950s, and bottom areas devoid of macroscopic life increased up to 1972 (69,000 sq km in the Gotland Deep) but decreased slightly in 1973 (56,000 sq km). The most severe pollutant problem in the Baltic appears to be PCBs, with the concentration of PCBs in guillemot eggs rising from $<$ 300 mg/kg in 1968 to $>$ 350 mg/kg in 1975, peaking in 1973 at $>$ 400 mg/kg. During the last 10 yr, the concentrations of mercury in fish from certain coastal areas has decreased to one-third earlier amounts. Concentrations of DDT have also begun to fall since the use of these products has been restricted; however, in 1975, the average content of DDT in guillemot eggs was about 450 mg/kg. It is not possible to assess the full impact of human activities on the Baltic Sea's ecosystem, though it seems unlikely that pollution control and cleanup measures can completely counteract the effects of overexploitation of fish resources, chemical pollution, introduction of new species, and land mismanagement. (Baker-FRC)

THE EFFECT OF INORGANIC AND ORGANIC MERCURY ON GROWTH KINETICS OF NITZSCHIA ACICULARIS W. SM. AND TETRASELMIS SUECICA BUTCH,
Santiago Univ. (Spain). Dept. of Microbiology.
B. Mora, and J. Fabregas.
Canadian Journal of Microbiology, Vol 26, No 8, p 930-937, August, 1980. 4 Fig, 6 Tab, 28 Ref.

Descriptors: *Phytoplankton, *Mercury, *Toxicity, *Growth rates, *Fluorescence, Analytical techniques, Diatoms, Inorganic compounds, Organic compounds, Salts, Marine algae, Bioassay.

The effects on two species of marine planktonic algae (Nitzschia acicularis and Tetraselmis suecica) from the northwest coast of Spain of mercury in the form of inorganic salts ($HgC12$, $HgSO4$, or $NH2HgC1$) and organic salts ($CH3HgC1$ and phenylmercuric acetate, PMA) were assessed by means of growth kinetics and in vivo fluorescence monitoring. Mercury concentrations ranged from 0 to 1.6 ppm. Data was analyzed by linear regression and by correlation. Addition of mercury at a concentration of 0.05 ppm in any of the three inorganic forms resulted in diminution of the lag phase and/or an increase in exponential growth; both species reached a final cellular density similar to or higher than the control. A linear relationship existed for both species between duration of the lag phase and mercury concentrations in the form of $HgSO4$. The organic forms of mercury were more toxic than the inorganic forms for both species. N acicularis failed to grow at any of the test concentrations of PMA, and, at 0.05 ppm Hg, T. suecica indicated internal disorganization and loss of fluorescence. However, at 0.025 ppm Hg (PMA), this species indicated growth after 12 days of inactivity. For $CH3HgCl$, there was no growth for 15 days even at 0.025 ppm, the lowest concentration, though at the end of the experiment, 66% of T. suecica cells appeared enlarged. Higher concentrations of mercury that still permitted cell growth nevertheless affected chlorophyll fluorescence in central cellular areas, and the cells also appeared slimmed. (Gish-FRC)

LAKE GENEVA (LEMAN): RESTORING THE BALANCE,
Foundation Ripaille, Thonon-les-Bains (France).
E. Neckler.
Environmental Conservation, Vol 7, No 2, p 122-124, Summer, 1980.

Descriptors: *Lakes, *Lake Geneva, *Eutrophication, *Water pollution effects, *Nutrient removal, Conferences, Water pollution, Phosphorus, Nitrogen, Fertilizers, Herbicides, Pesticides, Oil pollution, Legislation, Water purification, Nutrients, Biological treatment, Chemical degradation, Sewage disposal, Agricultural runoff, Water pollution control.

The findings and conclusions of a symposium on the conservation and pollution problems of Lake Geneva are reported. Since the 1950s, the Lake has become eutrophic, mainly due to the constant influx of residual waters bearing excessive loads of nutrient elements, including nitrogen and phosphorus. Algae and phytoplankton have proliferated, the waters have clouded, and fish with low oxygen requirements are proliferating at the expense of those with high oxygen requirements. A network of water purification centers provides mechanical, chemical, and biological purification (the latter has now achieved 90% efficiency despite variation in sewage). Phosphorus is the worst pollutant of recent years, and to reduce this problem, France and Switzerland have banned the sale of washing powders with $<$ 80% biodegradability. Efforts are being made to educate farmers to use less fertilizer in an attempt to reduce mud effluent containing phosphorus and nitrogen. Weed killers and pesticides represent only 1% of fertilizers used in the Lake area and are not a pollution threat. Streams containing rains that fall on roadways contain salt and hydrocarbons in increasing amounts. The symposium was in favor of putting restraints on the horsepower of motorboats used on the Lake; means of controlling oil pollution are already in effect. The best hope of restoring the Lake to an acceptable degree of purity lies in alerting residents of the Lake area to the condition of the Lake and to the danger of its relapse. (Gish-FRC)

BIOCHEMICAL AND HEMATOLOGICAL EFFECTS OF A TITANIUM DIOXIDE INDUSTRIAL EFFLUENT ON FISH,
Swedish Environment Protection Board, Studsvik. Brackish Water Toxicology Lab.
A. Larsson, K.-J. Lehtinen, and C. Haux.
Bulletin of Environmental Contamination and Toxicology, Vol 25, No 3, p 427-435, September, 1980.

Descriptors: *Titanium, *Bottom fish, *Fish physiology, *Heavy metals, *Iron compounds, *Sulfur compounds, Acidic water, Acidity, Water pollution effects, Bioassay, Toxicity, Zinc, Lead, Cadmium, Copper, Industrial wastes, Brackish water

Flounders (Platichthys flesus) were exposed under continuous flow conditions for 14 days to 370 or 685 microliters/liter brackish water of titaniumdioxide industrial effluent from a plant on the southwest coast of Finland. The effluent contained 4% iron sulfate, 3% sulfuric acid, and heavy metal concentrations in undiluted effluent of 33.60 micrograms zinc, 0.22 micrograms lead, 0.12 micrograms cadmium, and 1.50 micrograms copper/liter. When discharged into the recipient water near the plant, the extremely acid effluent increases pH and results in precipitation of the heavy metals. Studies have demonstrated that the effluent is deleterious to bottom dwelling organisms and fishes; a brown precipitate formed on the gills of Perca fluviatilis and Alburnus alburnus when they were exposed to low concentrations of the effluent for 2-4 weeks. Exposure of flounder to the effluent resulted in enhanced levels of blood glucose ($p = 0.001$) and blood lactate ($p = 0.007$), and elevated levels of hematocrit and hemoglobin in females. The observed disturbances were attributed to strictly mechanical actions of the precipitate on gill tissue or a disturbed gill function caused by the biochemical action of heavy metals present in the precipitate. Hematological disturbances may be caused by stress induced by exposure to the effluent. (Lisk-FRC)

REMOVAL OF HYDROCARBON POLLUTANTS FROM WATER BY PROTOTHECA ZOPFII,
West Virginia Univ., Morgantown. Water Research Inst.
R. S. Pore.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-110769, Price codes: A03 in paper copy, A01 in microfiche Technical Completion Report, 1980. 34 p, 5 Fig, 5 Tab, 12 Ref. OWRT-A-041-WVA (1), 14-34-0001-0152.

Descriptors: Algae, *Biological treatment, *Microorganisms, *Organic compounds, Treatment, Waste water treatment, *Water treatment, Aquatic microorganisms, Biodegradation, Ecosystems, Methodology, Microbial degradation, Organic wastes, Toxicity, Pollutants, Water pollution, Pesticides, Pesticide removal, Prototheca zopfii, Kepone

Bioaccumulation of Kepone and some other chemical pollutants from aquatic sources was

greatly enchanced by passage through a fixed-bed column containing the immobilized alga Prototheca zopfii. The living algae, immobilized in agar beads, removed the trace-level pollutants with an efficiency equal to or greater than activated charcoal. Hydrophobic partitioning was not the mechanism of bioaccumulation for the hydrophobic Mirex and Aflatoxin G (1) were not bioaccumulated, and metabolic inhibitors blocked bioaccumulation. The pollutants were stored, as the algae were incapable of biodegrading them. The pollutants with the greatest affinity for bioaccumulation were preferentially adsorbed in the presence of a mixture of different pollutants. The chemical recognition for bioaccumulation was very specific, and when it occurred, as in the case of Kepone, concentration factors on the order of 1,000,000 were obtained. The model system shows promise for several waste-water-treatment applications and for basic studies in bioconcentration.

THE SURVIVAL OF PATHOGENS DURING THE COMPOSTING OF WASTEWATER SLUDGE,
New Hampshire Univ., Durham. Dept. of Civil Engineering.
M. N. Flinkstrom.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-109811, Price codes: A06 in paper copy, A01 in microfiche. Master of Science Thesis, 1980. 96 p, 16 Fig, 13 Tab, 23 Ref, 3 Append. OWRT B-006-NH (1), 14-34-0001-0272.

Descriptors: *Decomposing organic matter, *Domestic wastes, *Sewage treatment, *Aerobic treatment, *Streptococcus, Organic wastes, Sludge, Aeration, Municipal Wastes, Sewage, Solid wastes, Aerobic bacteria, Sewage bacteria, Coliforms, Pathogenic fungi, Biodegradation, Pathogenic bacteria, Composting, Sludge composting, Sludge treatment, New Hampshire, Forced aeration composting, Wastewater sludge disposal, Domestic wastewater sludge, Static pile composting.

Two complete composting periods, including active composting by static pile forced aeration and curing were monitored in this study. Samples from four sites representing interior and exterior portions of the compost pile were collected regularly. The survival of two groups of bacterial indicators, fecal coliform and fecal streptococcus, and one fungus, Aspergillus fumigatus, were monitored during the two composting periods studied. Temperature, pH, moisture content, and carbon:nitrogen ratio of the compost material were also monitored. Data collected indicated that the organisms studied here were virtually eliminated during the composting of raw wastewater sludge. Temperature within the compost mass had the greatest effect on the survival of the organisms, but many factors were responsible for the patterns of survival and destruction noted.

THE EFFECT OF PROCESS DESIGN ON REDUCED WATER USE AND WASTE IN DAIRY PROCESSING,
North Carolina State Univ. at Raleigh.
R. E. Carawan, and W. J. Harper.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-110330, Price codes: A11 in paper copy, A01 in microfiche. Water Resources Center. The Ohio State University, Columbus, Project Completion Report 502X. June 1980, 217 p, 18 Fig, 59 Tab, 218 Ref. OWRT-A-043 OHIO (2).

Descriptors: *Dairy industry, *Waste water treatment, *Sewerage, Model studies, Water pollution control, Costs, Industrial wastes, Municipal sewer system.

Procedures were developed for evaluating management and process modification in dairy plants to minimize water use and resource losses. The study utilized a medium sized, multi-product dairy plant as a model for the study. Water use, wastewater discharge, product loss and waste contribution was determined for each unit process. Waste parameters evaluated emphasized water volume, biochemical oxygen demand (BOD) and fats, oils and grease (FOD). Alternative processes were selected for reduction of water and wastes and evaluated for cost effectiveness. A linear program model was developed for the model plant on a unit processes basis and solutions obtained to evaluate the effects of process modifications, effluent restrictions and costs of water and waste discharges on cost effectiveness of the model plant and the model plant after process modifications. Without process modifications an effluent limitation of 2000 mg/l BOD would shut down ice cream and cottage cheese operations and results in a 75% reduction of milk processing. With all available process modifications, the plant could process 100% of milk and ice cream and 23% of the cottage cheese.

ANALYSIS OF THE CHEMISTRY ASSOCIATED WITH OZONOLYSIS OF ORGANIC POLLUTANT MOLECULES IN WATER,
Wesleyan Univ., Middletown, CT.
W. Pringle.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-115651, Price codes: A02 in paper copy, A01 in microfiche. Completion Report, September 16, 1980. 8 p, 2 Fig, 12 Ref. OWRT-A-070-CONN(1).

Descriptors: *Water pollution, *Waste water treatment, *Chemical reactions, *Kinetics, *Toxins, *Analytical techniques, Assay, Waste treatment, Water quality, Water chemistry, Chemistry, Pollutants, Water pollution sources, Pollutant identification, Poly-chlorinated biphenyls, Water pollution treatment, Chemical analysis, Investigations, Chlorination.

This study sought to examine the chemistry and rates of chemical oxidation and to identify compounds residual from ozonation of organics identified in sewage treatment plant water. An all-glass system was constructed to ozonize aqueous solutions of trace organics, modified to contain quartz reaction cells for UV irradiation and to reduce sparging. Products and product yield rates were determined by instrumental analysis, including gas chromatography (GC), GC-mass spectrometry, pulsed Fourier transform nuclear magnetic resonance, and an assembled linear array photo-detector-computer system for laser-induced narrow-line low-temperature fluorescence spectra of trace organic concentrations. Toxic compounds studied for ozonation, oxidation products analysis, and reaction kinetics were phenol, the three chlorophenol isomers, dibenzofurane as a model for its toxic chlorinated analogs, and chloroform. Large differences were noted in the ozonolysis rates of the three chlorophenol isomers. It was also determinated that dibenzofurane ozonolysis was much faster in water than in organic solvents. Matrix isolation fluorescence was also examined as a trace technique for polycyclic aromatic hydrocargons. It was sought to study ozonolysis to determine conditions for removal of toxic or suspect carcinogens resulting from chlorine treatment of sewage organics. (Zielinski-IPA)

APPLICATION OF THE AEROBIC-MEDIA TRICKLING FILTER TO NITROGEN CONTROL IN WASTEWATER TREATMENT,
West Virginia Univ., Morgantown. Water Research Inst.
C. R. Jenkins, G. K. Bissonnette, P. B. Huff, and G. W. Gillespie.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-118762, Price codes: A03 in paper copy, A01 in microfiche. Information Report 14, 1980. 40 p, 11 Fig, 12 Tab, 54 Ref. OWRT-A-036-WVA(3), 14-34-0001-8052.

Descriptors: *Aerobic treatment, Equipment, *Nitrification, Oxygenation, *Sewage treatment, *Trickling filters, *Waste water treatment, Aeration, Biological treatment, Filters, Nitrogen, Oxygen, Secondary treatment, Solids contact processes, Treatment, Wastes, Waste treatment, Water pollution treatment.

Chemical and microbiological evaluation of a bench-scale aerobic-media trickling filter (AMTF) showed the system to be successful in promoting rapid nitrification of a synthetic secondary-treated sewage effluent. Efficient nitrification occurred for a variety of hydraulic and substrate-nitrogen loadings. Microbiological analyses of the pure oxygen fixed-film reactor indicated that the nitrification process is more dependent upon the activity levels of the nitrifying bacteria than on their absolute densities. Both heterotrophic and nitrifying bacteria were distributed throughout the entire depth of the AMTF without any distinct population profiles. Although pH depression occurred in the lower half of the reactor, nitrifying bacteria densities were not seriously affected. The reactor as constructed is competitive in terms of size and performance with most nitrification systems currently in use.
W81-00120

PROCESS FOR CONCENTRATING TRITIUM AND/OR TRITIUM HYDRIDE AND SEPARATING IT FROM TRITIUM WATER,
Hoechst A.G., Frankfurt am Main (Germany, F.R.).
H. Hesky, and A. Wunderer.
U.S. Patent No 4,190,507, 3 p, 1 Fig, 6 Ref. Official Gazette of the United States Patent Office, Vol 991, No 4, p 1362, February 26, 1980.

Descriptors: *Patents, *Waste water treatment, *Industrial water, *Tritium, Radioactive wastes, Water pollution sources, Electrolysis, Nuclear wastes, Tritium water.

A process for obtaining concentrated tritium and/or tritium hydride and separating it from tritium water is disclosed. In the reprocessing of spent nuclear fuel, the radioactive substance, tritium, in addition to other substances, is released. The tritium so obtained is in the form of tritium water which cannot be recycled and must be stored. Tritium water is intended to include a mixture of water, tritium hydroxide and di-tritiumoxide. Due to the radioactivity of tritium, the tritium water is decomposed into oxyhydrogen gas and tritium steam which must be stored under controlled conditions. By contrast, elemental tritium and/or tritium hydride can be stored without any need for controlled conditions provided that the generated heat is dissipated in a suitable manner. It is therefore, the object of this invention to obtain tritium and tritium hydride in high concentration. This problem is solved by increasing the concentration of tritium hydroxide and di-tritium oxide in the tritium water through distillation and then electrolyzing the enriched mixture. The mixture can be charged to an electrolytic enrichment cascade. The product of electrolysis, i.e., concentrated tritium, is stored and the oxygen is reduced by NO and worked-up to yield nitric acid, which is then used as a solvent in the reprocessing of spent nuclear fuel. (Sinha-OEIS)

PROCESS FOR REMOVING CHALCOPHILE ELEMENTS FROM AQUEOUS SOLUTIONS BY ELECTROLYSIS,
National Research Inst. for Metals, Tokyo (Japan). (Assignee).
H. Kametani, and T. Mitsuma.
No 4, p 1362, February 26, 1980.

Descriptors: *Patents, *Waste water treatment, *Water pollution treatment, *Industrial water, *Metals, Electrolysis, Separation techniques, Electrochemistry, Sulphides, Chalcophile.

Aqueous solutions containing ions of chalcophile elements are waste waters which occur in the refining and fabricating of metals and in the material industry. To prevent environmental pollution,

these industrial waste waters can be discharged after removing noxious elements, especially heavy metals. The invention provides a process for separating a chalcophile element from an aqueous solution by an electrolytic technique using elemental sulfur as a sulfidizing agent. The process comprises electrolyzing an aqueous solution containing one or more chalcophile elements in the form of ion as a catholyte under acidic conditions in the presence of elemental sulfur powder to precipitate the chalcophile element in the form of sulfide, and separating the precipitated sulfide from the aqueous layer. (Sinha-OEIS)
W81-00127

ELECTROCHEMICAL PROCESS FOR THE REMOVAL OF CONTAMINANTS FROM AQUEOUS MEDIUM,
Eastman Kodak Co., Rochester, NY. (Assignee).
C. M. Chaffin.
U.S. Patent No 4,190,509, 3 p, 8 Ref. Official Gazette of the United States Patent Office, Vol 991, No 4, p 1362-1363, February 26, 1980.

Descriptors: *Patents, *Waste water treatment, *Water pollution treatment, Metals, Separation techniques, Industrial wastes, Cooling water, Chromium, Electro-chemistry, Equipment, Regeneration.

Among the most difficult purification problems are those relating to removing small quantities of metallic or anionic radical contaminants from dilute aqueous solutions, such as rinse water from chrome plating operations and purge streams from cooling tower waters that contain hexavalent chromium Contaminating ions are removed from an aqueous media by an electrochemical method which includes formation of an insoluble iron compound or complex of the contaminant ion utilizing an anode of iron, iron alloy or insoluble iron compound. The hexavalent chromium contaminant, as chromate or dichromate, is changed to trivalent chromium, a less toxic form. Under continuous production operation it has been found that the electrical activity of the cell decreases with time requiring a regeneration of the system. Regeneration of the electrochemical cells can be accomplished without an acid backwash. This improvement consists of modifying the electrochemical cell so as to permit the periodic introduction into the cell of a volume of a compressed gas. Sufficient compressed gas should be provided to provide a thorough agitation throughout the cell. This compressed gas regeneration may be used as a total replacement for acid wash systems or it may be used in conjunction with the acid wash system to reduce the frequency of acid washing. (Sinha-OEIS)

PROCESS FOR BIOLOGICAL PURIFICATION OF WASTE WATER,
Stamicarbon, B. V., Gellen (Netherlands). (Assignee).
B. H. N. Dassen.
U.S. Patent No 4,190,528, 6 p, 2 Fig, 7 Ref. Official Gazette of the United States Patent Office, Vol 991, No 4, p 1368, February 26, 1980.

Descriptors: *Patents, *Waste water treatment, *Water pollution treatment, Biological treatment, Hydrolysis, Activated sludge, Temperature, Ammonia.

A process for the biological purification of waste water is described in which a suspension of the surplus sludge formed during the purification is hydrolyzed in a basic medium and at elevated temperatures. The process is carried out by giving the suspension of the sludge a pH value of between about 8 and about 11 and carrying out the hydrolysis in the presence of a volatile base at a temperature of between about 90 and 300 degrees. The base is removed from the hydrolysate formed after the hydrolysis has been terminated. Ammonia or a bound form, such as ammonium carbonate, is used as the volatile base. The ammonia that has been removed from the hydrolysate is returned to the hydrolysis stage. (Sinha-OEIS)
W81-00129

WASTE WATER FILTRATION AND SLUDGE REMOVAL SYSTEM,
Armco, Inc., Middletown, OH. (Assignee).
E. L. Wyatt.
U.S. Patent No 4,190,534, 9 p, 7 Fig, 6 Ref. Official Gazette of the United States Patent Office, Vol 991, No 4, p 1369-1370, February 26, 1980.

Descriptors: *Patents, *Waste water treatment, *Water pollution treatment, Industrial wastes, Filtration, Separation techniques, Water reuse, Sludge, Iron, Equipment.

The invention describes a waste water filtration and sludge removal system where the waste water produced by the types of steel treatment processes can be filtered to produce reusable wash water and an iron sludge having an acceptably low water content for convenient handling and possibly for use as a soil conditioner, etc. The system includes a trough-like filtering tank having weep holes along the lower edge draining into an inclined channel for capturing filtered water for reuse, and also includes a multiple layer filter bed containing an upper layer of fine jagged surfaced particles for capturing filtered sludge. The sludge layer deposited on the surface of the upper filter layer is periodically moved by means of an adjustable screed blade toward an elevated discharge station for removal from the tank without significantly disturbing the filter bed. The screed blade may be automatically raised out of contact with the sludge layer when operated in the reverse direction (Sinha-OEIS)
W81-00132

APPARATUS FOR ON-SITE RENOVATION OF SANITARY WATERS,
F. Besik.
U.S. Patent No 4,190,539, 6 p, 1 Fig, 6 Ref. Official Gazette of the United States Patent Office, Vol 991, No 4, p 1371, February 26, 1980.

Descriptors: *Patents, *Waste water treatment, *Sewage treatment, Water pollution treatment, Domestic wastes, Separation techniques, Oxidation, Chemical precipitation, Equipment

A self-contained apparatus for on-site renovation of sanitary waters comprises three bioreaction chambers, a mineral storage and dispensing container, a submerged suspended solids separator located in the third bioreaction chamber, a flow equalizer, a chemical oxidizing agent dispensing system, a chemical oxidation-clarification chamber and a charcoal containing chamber, all enclosed in a single tank designed for use as on-site single or multiple family waste water renovation system. (Sinha-OEIS)
W81-00134

WASTE WATER TREATMENT APPARATUS,
Aqua-Aerobic Systems, Inc., Rockford, IL. (Assignee).
T. B. Wade, and J. A. Knight.
U.S. Patent No 4,190,541, 8 p, 6 Fig, 5 Ref. Official Gazette of the United States Patent Office, Vol 991, No 4, p 1372, February 26, 1980.

Descriptors: *Patents, *Waste water treatment, *Water pollution treatment, Equipment, Cleaning, Settling basins, Sludge disposal.

A waste water treatment apparatus is described in which a carriage support rail extends across the top of the tank intermediate the side walls of the tank. A carriage is mounted on the rail and is driven by a carriage drive including an endless chain which reciprocates the carriage along the rail. A tank cleaning head is mounted on the carriage for movement along a path adjacent the bottom of the tank. The carriage support rail is in the form of a box-shaped beam having inwardly directed flanges at its underside and the chain is mounted inside the box-shaped beam to be protectively enclosed in the beam. The carriage has wheel mountings extending upwardly into the beam at opposite sides of the chain and carriage support wheels are mounted on the wheel mountings inside the beam and in rolling engagement with the flanges on the beam to support the carriage. The chain has upper and lower runs extending lengthwise of the tank and carries a drive lug The carriage has an upper and lower follower alternately engaged by the drive lug as it moves respectively along the upper and lower runs of the chain to reciprocate the carriage. (Sinha-OEIS)
W81-00135

WASTE WATER TREATMENT APPARATUS,
J. M. Pederson, and W. J. Beckman, Jr.
U.S. Patent No 4,190,543, 6 p, 5 Fig, 11 Ref; Official Gazette of the United States Patent Office, Vol 991, No 4, p 1373, February 26, 1980.

Descriptors: *Patents, *Waste water treatment, *Water pollution treatment, Sewage treatment, Biological treatment, Flow control, Sludge disposal.

A waste water treatment apparatus and process is especially adapted for tertiary treatment of sewage where biological media panels are positioned in a treatment tank in a manner so that the formation of a stable mat or film composed of solids is established on them. Biological growth on the panels is enhanced while at the same time excessive solids build-up is avoided. Flow through the tank is directed in a generally horizontal fashion and sludge removal is accomplished by pump means (Sinha-OEIS)
W81-00136

ENERGY SAVING IN ACTIVATED SLUDGE TREATMENT,
Philadelphia Water Dept., PA.
C. F. Guarino, M. D. Nelson, M. Lozanoff, and T. E. Wilson.
Public Works, Vol 111, No 10, p 57-62, 94, October, 1980. 8 Fig, 5 Tab.

Descriptors: *Activated sludge, *Biodegradation, *Aeration, *Pilot plants, Submergence, Suspended solids, Biochemical oxygen demand, Performance, Evaluation, Sewage treatment, Municipal wastes, Waste water treatment.

The upgrading of a Philadelphia waste water treatment plant to provide secondary treatment by a process known as 'Surfact' is described. It was estimated that the Northeast plant conversion to Surfact, which took place in the 1970's, would save $50 million in operating costs over the plant's 20-yr life while reducing energy consumption by 33%. The process combined activated sludge treatment and rotating biological contactors. The objective of this phase of the program was to ascertain the capabilities of an air-driven system, but it was also discovered that microbial growth was increased as compared with mixed liquor solids. A prototype installation was set up in six different modes to provide variations in waste water temperature, effluent BOD, solids retention time, dissolved oxygen, flow rate and air consumption. Modifications were needed in 1978 to provide additional oxygen at a reduced air flow of 6000 cfm. A step feed system was also constructed. Pilot test results for two modes indicated BOD removals of 84% and 95%. As the solids retention time goes past 5, leveling occurs in the amount of removal. A typical effluent suspended solids level at the Northeast plant would be in the range of 110-120 mg/liter To allow all discs to carry maximum growth levels, a proper combination of mixed liquor flow and loading was necessary. In biological studies, the Surfact adaptations produced an aerobic system with flagellates, swimming ciliates, and stalked ciliates. Settling tests showed that sludge in the prototype settled best at high overflow rates Optimum disc rotation was 1.5 rev/min. Use of disc solids aided energy conservation. Initial settling velocities of 19 ft/hr were possible. The construction time for upgrading to Surfact was estimated to be minimal. (Geiger-FRC)

SWEDISH WASTEWATER TECHNOLOGY SETS FAST PACE,
Water and Sewage Works, Vol 127, No 9, p 68, 71-72, 77, September, 1980. 4 Fig, 2 Tab.

Descriptors: *Waste water treatment, *Sweden, *Technology, *Treatment facilities, *Biological treatment, Chemical degradation, Sewage treatment, Biochemical oxygen demand, Nutrient removal, Municipal wastes.

Advancements made over the past 10 yr in Sweden regarding treatment of waste water are reviewed. One of the problems which had faced the Swedish government in 1969 was the level of phosphorus in the water. Biological/chemical plants constructed to meet this challenge are today producing waste waters with at least 98% removal of BOD and phosphorus. Most plants are operating at moderate costs due to success in design engineering and reliability of equipment. Turnkey operations have eliminated fault finding. The contractors assume all responsibilities for the first year of operation and they also train the staff that will eventually take over operations. Specific plants are described that are located at Hoor, Findus, and Malmo. Some other plants are not operated on the turnkey system. Two of these which are described are the plant at Hassleholm, and the one at South Stockholm, Henriksdals. One method currently under study calls for treating sediment to function as an ion exchanger where lime addition is not effective. Novel gasketing systems which have been designed for the Swedish systems are also described. (Baker-FRC)

DESIGN AND ECONOMIC CONSIDERATIONS OF GAC SYSTEMS,
Philadelphia Water Dept., PA.
C. F. Guarino, J. V. Radziul, P. R. Cairo, D. D. Blair, and M. M. Pence.
Water and Sewage Works, Vol 127, No 9, p 58-59, 63-64, 66-67, September, 1980. 4 Fig, 13 Tab, 8 Ref.

Descriptors: *Activated carbon, *Computer models, *Economic efficiency, *Treatment facilities, *Design criteria, *Evaluation, Costs, Capital costs, Operating costs, Maintenance costs, Water treatment, Water purification, Granules, Filtration, Chlorination, Pilot plants, Delaware River.

A flexible computer model was used to evaluate modifications to EPA granular activated-carbon (GAC) design criteria. The cost model was calibrated with data from literature, manufacturer's costs, and information based on GAC facilities in use. Pilot studies were conducted at the Torresdale (Philadelphia) plant where prechlorinated, clarified and filtered water from the Delaware estuary was applied to columns operating at empty bed contact times. Influent and effluent from these columns were analyzed. Major design parameters considered in the economic analysis of GAC post-contactor treatment included various capital items, operation and maintenance costs, and financial items. Major capital costs were the initial carbon, pumping station, contactors, and regeneration facility. Of the operation and maintenance costs, carbon to compensate for the 7% loss was most significant. Analysis of the effects of inflation for various contact times revealed that shorter contact times were more economical with lower rates of inflation. Comparison pilot studies indicated that the proposed EPA design criteria produced a similar bed life for the same contact time in both sand-replacement and post-contactor GAC operations. It is noted that, if a criterion for bed life that is able to discern performance levels between the two systems is developed, the post-contactor system may be more economical than sand replacement. ION-EXCHANGE BEDS DEFY ORGANIC FOULING,
Belco Pollution Control Corp., Parsippany, NJ.
R. J. Cichon, R. B. Trattner, and P. N. Cheremisinoff.
Water and Sewage Works, Vol 127, No 9, p 48-49, 54, 100, September, 1980. 4 Fig, 4 Tab.

Descriptors: *Ion exchange, *Resins, *Filtration, *Adsorption, *Activated carbon, Organic acids, Fulvic acids, Cation exchange, Anion exchange, Organic wastes, Municipal wastes, Waste water treatment.

The design of ion-exchange beds to withstand organic fouling is described. Field testing is essential because organic matter can consist of such compounds as humic and fulvic acids. The object in ion-exchange is to remove inorganic impurities by demineralizing with simultaneous decolorization by removing anionic color bodies. Various ion-exchange resins were tested with and without activated carbon filtration to determine benefits from ion-exchange as an organic scavenger. The fouling of resins results in poor resin kinetics. Severe fouling results in an increase of dissolved-solids leaking through as flow rate increases and a gradual breakthrough pattern at exhaustion. Six types of mixed beds and streams were tested: isolated, layered, mixed bed; activated carbon and layered, mixed bed; organic trap (S-37) and layered bed; organic trap (A-340) and layered bed; organic trap (IRA-68) and layered, mixed bed; and activated carbon, organic trap (S-37), and layered, mixed bed. The two streams and beds which were most effective were: organic trap (S-37) and layered bed; and activated carbon, organic trap (S-37) and layered mixed bed. Organic matter did not hinder performance of properly structured beds containing ion-exchange resins. (Baker-FRC)

CHEMICALS SUBSTITUTE FOR BIOLOGICAL TREATMENT,
Clark County Sanitation District Las Vegas, NV.
J. H. Parrott.
Water and Sewage Works, Vol 127, No 9, p 36-37, 105-106, September, 1980. 1 Fig, 1 Tab.

Descriptors: *Treatment facilities, *Chemical degradation, *Flocculation, *Sludge treatment, Biochemical oxygen demand, Suspended solids, Trickling filters, Phosphorus, Construction, Separation techniques, Waste water treatment, Waste water disposal, Municipal wastes.

District flow projections in 1975 showed that the Flamingo Road facility of Clark County, Nevada would need a new operation system to handle the rapidly expanding community by 1979. Initial tests indicated that chemical additions would be needed to meet new discharge limitations. The west plant was chosen as the test site over the east plant and its secondary system and trickling filters are described. Energy from the downstream side of the recirculation box leading to a secondary clarifier could be used at the west plant. A 4000 gal pool was erected near the recirculation box and a metering pump was placed at the box and by a manhole 100 ft downstream from the recirculation box. Results showed that high BOD and suspended solids removals were possible. Dosage rates of 100 mg/liter of ferric chloride and 150 mg/liter of alum gave 15 mg/liter BOD, 15 mg/liter suspended solids and 1 mg/liter P or better. After full plant tests, the state agreed to an increase of 36 mgd. A fully automated system was implemented with central monitoring chemical and polymer feed pumps for both the east and west facilities. During full scale operation, the clarity of the secondary clarifiers without chemical additions was poor, but after chemical additions and flocculation, water became quite clear. A consent decree changed the January 1, 1981 discharge limitations to 30 mg/liter BOD, 30 mg/liter suspended solids, and 1 mg/liter P. Preliminary tests show that 10, 10 and 1 mg/liter for BOD, suspended solids and P are attainable, respectively. Projected costs of operation for the new system are $92/million gal of discharge. The only foreseeable problems will be with sludge removal and disposal. (Geiger-FRC)

BIOLOGICAL FLUIDISED BED TREATMENT FOR WATER AND WASTEWATER - A REVIEW OF THE WRC/UMIST CONFERENCE,
Water Pollution Research Lab., Stevenage (England).
P. Cooper.
Water Services, Vol 84, No 1014, p 475-476, 479-480, August, 1980. 3 Fig, 4 Ref.

Descriptors: *Biological treatment, *Biodegradation, *Sands, *Research and development, *Fluid mechanics, Porous media, Conferences, Waste water treatment, Industrial wastes, Sewage treatment, Water treatment, Suspended solids, Potable water, Oxidation, Anaerobic conditions, Engineering, Economics, Particle size, Biological fluidized beds.

This conference was the first conducted on all aspects of biological fluidized bed (BFB) water treatment. Papers discussed the basic principles of BFBs, the use of BFBs in the treatment of potable water, of sewage, and of industrial effluents, the treatment of settled sewage by anaerobic BFB systems, the process engineering of BFBs and the pilot-plant experiences of two companies that will soon be selling BFB systems, and the economics of BFBs compared with activated sludge systems. The first reported work on the performance of BFBs under diurnal-flow and variable-load conditions was presented, and it was concluded that a carefully designed plant could overcome these problems. A unique two-phase system in which air was used as the oxygen source was described. Several conclusions were drawn. Sand was the most widely used solid medium for two-phase systems. The cost of oxygen is a major problem in the United Kingdom but not in the USA; anaerobic treatment may prove more feasible. More information on media/biomass separation and BFB performance under nitrifying conditions is required. The start-up of reactors is not such a major problem as was previously thought. A liquid distribution system described at the conference may be suitable for full-scale plants. The implementation of full-scale plants is still needed. (Gish-FRC)
W81-00238

CLEANER TYNE.
Water Services, Vol 84, No 1014, p 467-469, 471-472, August, 1980. 12 Fig.

Descriptors: *Sewerage, *Interceptor sewers, *Settling basins, *Telemetry, *Treatment facilities, Sewage treatment, Sewers, Water pollution, Waste water treatment, Rivers, Sewage disposal, Screens, Sludge disposal, Instrumentation, Aeration, Planning, Municipal wastes, Control systems.

The 107-million pound Tyneside Sewerage Scheme to reduce pollution in England's River Tyne is described. The project, which is more than 60% complete, involves the construction of interceptor sewers running parallel to the river and coastline which will intercept > 100 existing discharges to convey the sewage to the Howdon Sewage Treatment Works (HSTW). Sewage from the river's south bank will flow to the Preliminary Treatment Works at Jarrow (JPTW) on the south bank, where it will be directed under the river to the HSTW. Sewage from the north bank will flow directly to HSTW. The total length of the sewers will be approximately 75 km. JPTW incorporated coarse bar screens followed by fine bar screens, a Geiger press, and aerated spiral flow grit channels to remove grit particles > or = 0.2 mm in diameter. HSTW is designed for a future population of one million and in the first stage will provide for the removal of screenings and grit followed by sedimentation. There are 12 sedimentation tanks, each with a capacity of 7,400 cu m. A computer with telemetry equipment provides communication between HSTW and 118 outstations at remote plant centers, pumping stations, treatment works, and flow measurement stations. Sludge collected at HSTW will be transported by a sea-going vessel (capacity: 1,500 tons sludge, 50 tons grit) for dumping at sea. Sufficient land exists for a secondary treatment plant to be built at Howdon if necessary. (Gish-FRC)
W81-00239

FOOD PROCESSING WASTES MANAGEMENT,

Russell Research Center, Athens, GA.
W. K. Whitehead.
Agricultural Engineering, Vol 61, No 8, p 26-27, August, 1980. 3 Fig.

Descriptors: *Food processing industry, *Waste water treatment, *Waste water reclamation, Industrial wastes, Aerobic treatment, Irrigation, Lagkoons, Land treatment, Biochemical oxygen demand, Water conservation, Water reuse, Pretreatment(Water), Sewage treatment, Organic wastes, Water pollution sources.

Methods for conservation and efficient use of water by food-processing plants are identified. Waste water, the most difficult byproduct of food-processing operations to dispose of, can be partially reclaimed in caning operations, which can reduce water use by 30%, as well as almost eliminate the need for water softeners and lower water heating requirements. Ways in which food processing plants control pollution are inhouse control (including water conservation) and pretreatment or full treatment prior to discharge. Secondary treatment appropriate in rural areas include aerobic lagoons, which have a sporadic performance, and land application, which is not yet in common practice. All reduce organic loading to streams. The choice of method is a function of plant location and economic factors including costs related to waste management regulations. (Titus-FRC)
W81-00241

ONSITE WASTEWATER TREATMENT FOR A RECREATION AREA,
ADI Ltd., Fredericton (New Brunswick).
T. Viraraghaven, R. C. Landine, and G. H Jenkins.
Public Works, Vol III, No 10, p 63-64, October, 1980. 1 Fig.

Descriptors: *Recreation facilities, *Septic tanks, *Tile drainage, *Domestic wastes, Waste water treatment, Sanitary engineering, Sewers, Tile drains, Sumps, Waste water disposal.

A system was designed to handle waste water treatment at the Cavendish Beach recreation area on Prince Edward Island National Park. The system was to handle 13,200 Imperial gallons (Igal) per day with the flow being generated over a period of 8 hrs. Various onsite treatment alternatives were considered including package or other mechanical treatment plants with a surface discharge of effluent, two-cell stabilization pond with surface discharge of effluent, spray irrigation, or septic tank-tile field system. The fourth choice was the one installed. The 400-foot 8-inch gravity sewer running from the changehouse/concession facility to the septic tank has a maximum flow of 66 Igpm. The septic tank capacity is 14,000 Igal in two compartments with minimum volume being equivalent to the daily flow. Sump capacity is 1,250 Igal, 75% of the volumetric capacity of tile in one field. Soil in the three tile beds consisted of sandy silt with relatively low permeability. The system has a rest period of 8 months a year and 12 to 16 hr during the daily operation in the summer. (Baker-FRC)
W81-00242

FEEDING OF PRESSURE FILTERS,
Effluent and Water Treatment Journal, Vol 20, No 8, p 399-401, August, 1980. 4 Fig.

Descriptors: *Filters, *Pressure, *Flow, Mechanical properties, *Sludge treatment, Dewatering, Separation techniques, Bulk density, Pumps, Treatment facilities, Filtration, Flow resistance, Waste water treatment.

The designing of feed systems to serve pressure filters is discussed. Feed requirements for a filter designed to serve and operate under a given set of conditions are highly predictable. These requirements are related to the size of the filter, the dry solids level of the cake to be produced, the density of the individual sludge particles, the length of the filtration cycle, and the concentration of the conditioned sludge to be supplied to the filter. Pilot testing will provide the needed information. During initial operation, the mechanical design of the filter and its piping will determine the resistance to the flow through the filter. However, soon the permeability characteristics of the conditioned sludge will become the dominant influence and the flow to the end of the cycle will be greatly influenced by that permeability. An example is given in which a Willett model 12/150/34/B is used to feed a filter. (Baker-FRC)
W81-00248

DISC DIFFUSERS,
Effluent and Water Treatment Journal, Vol 20, No 8, p 393, 395, August, 1980. 2 Fig, 1 Tab

Descriptors: *Aeration, *Diffusion, *Bubbles, *Sludge treatment, *Pores, Disc diffusers, Porosity, Injection, Air circulation, Activated sludge, Testing, Oxygenation, Ozone, Waste water treatment.

The Degremont DP203 porous ceramic diffuser is a 230-mm diameter disc, 19 mm in thickness and composed of a blend of corundum grains bonded together using ceramics. The disc is used for the diffusion of clean oil-free gases into liquids, and for aeration of activated sludge where low noise levels, flexibility of operation, ease of maintenance and high oxygenation are important. It may also be applied to obtain optimum contact conditions for ozonization of potable water, industrial effluents, and sewage. The new disc with flat surface is compared with the earlier dome diffuser. The disc provides 60% more surface area than the dome and has perpendicular edges that provide greater oxygenation capacity. It can support a vertical load of 400 kg and diffuse clean, oil-free air into the liquid in a column of bubbles 2 to 3 mm in average diameter at a height of 50 mm above the surface of the disc. Tests carried out by the Water Research Centre and Degremont to assess disc performance showed that at a depth of 4 m and a flow rate of 3.3 cu mm/hr/disc, the oxygenation efficiencies in clean water ranged from 5.41 to 5.56 kg oxygen/kwh. In a larger tank, slightly poorer oxygenation efficiencies were observed. Experiments comparing discs and domes providing the same surface area under identical operating conditions resulted on the average in a 10% higher oxygenation efficiency when the discs were used. (Geiger-FRC)

5E. Ultimate Disposal Of Wastes

INDUSTRIAL TECHNOLOGY ADAPTED TO MUNICIPAL SLUDGE DRYING,
Public Works, Vol 111, No 10, p 51-53, October, 1980. 4 Fig.

Descriptors: *Treatment facilities, *Incineration, *Sludge disposal, *Solid wastes, Dewatering, Oxygenation, Coagulation, Steam, Cryogenics, Drying, Waste water treatment, Sludge treatment.

The implementation of municipal sludge drying is part of a $27.5 million waste water treatment project in Harrisburg, Pennsylvania. The city's improved and expanded facility is an energy recovery system which will upgrade the sewage treatment and water quality, help provide a solution to solid waste and sludge disposal problems, and generate more than a million dollars per year through the use and sale of steam for district heating and recycled metal. Design considerations included a 65-mgd settled sewage pumping station, three four-stage oxygenation tanks, cryogenic oxygen generating equipment, two flash mixing tanks to add alum, six rapid sludge removal final settling tanks, a return sludge pumping station, two gravity thickeners, one new chlorine contact tank, and two sludge digesters. Currently the incinerator does not fall under the stipulations of the Federal Air Quality Act. However, state standards are being met or exceeded by the use of electrostatic precipitators. At full capacity the incinerator will process 720 tons/day of solid waste and 35 tons/day of sludge, resulting in a residue of 7% of the original volume. (Baker-FRC)

FLUID BED INCINERATION,
R. J. Sneyd, and D. T. Mayrose.
Water and Sewage Works, Vol 127, No 9, p 38-40, 44-45, September, 1980. 7 Fig, 6 Tab.

Descriptors: *Sludge disposal, *Incineration, *Heat exchangers, *Ultimate disposal, Sludge treatment, Drying, Mechanical enginering, Dewatering, Separation techniques, Treatment facilities

Use of fluid bed incineration in the design of the West German Marienfeld sewage treatment plant and other such plants under construction in North America is reviewed. A fluid-bed reactor consists of three basic sections. The upper is the area for disengagement of the bed material from the upmoving air stream. The fluidized bed boils rapidly, providing the extreme mixing which is important for good combustion. Feeding sewage sludge into the fluidized mass is normally accomplished with either screw feeders or positive displacement pumps. Complete combustion of the sewage sludge takes place within the bed in less than one minute with only 40% excess air. Early fluid-bed incineration systems made use of the cold-windbox design. This design is discussed and compared with the hot windbox concept which is essentially similar except for the addition of a heat exchanger. Various types of gas scrubbers may be employed With vacuum filters or centrifuges, cakes of sludge with a primary-to-secondary sludge ratio of at least 50% are sent to incineration with 18-22% dry solids. Various advantages of using fluidized beds are detailed. Environmental compatibility and size selection are considered. (Baker-FRC)

LONG SEA OUTFALL UNDER CHESIL BEACH.
Water Services, Vol 84, No 1014, p 540-541, August, 1980. 3 Fig

Descriptors: *Outfall sewers, *Pipelines, *Pipe flow, *Sewage disposal, *Sites, Oceans, Ultimate disposal, Sewerage, Treatment facilities, Discharge lines, Construction, Pumping, Waste water treatment, Municipal wastes, Waste water disposal.

The remodeling of the Weymouth, Portland, and Wyke Regis sewage disposal facilities in England was carried out in the late 1970's. The sea discharge of both outfalls was just 300 m off the harbor mouth, a distance considered too short by modern standards. A study of inland treatment options which examined seven sites uncovered one site at Wyke Castle as a suitable place to begin tunneling. The discharge from this point would be 400 m offshore from Chesil Beach, however expenses for the plan were too high. Offshore and onshore studies up to the design stage were carried out and it was decided that all existing outfalls with flows intercepted and sent to Wyke Regis would be eliminated. The new outfall at Weymouth will be 2.7 km long and 1.68 m in diameter It will have 10 diffusers at 4.5 m intervals each with twin 250 diameter jets. Incoming solids will be reduced to under 5 mm diameter by the headworks and screenings will be stored until removal by tanker. Most of the headworks housing will be underground so that it will not be visible to nearby residents. Outfall flow will be by gravity and it was reported to be 415 m out at the author's last visit to the facility. Water from an aquifer was found in the shaft and tunnel, but this was remedied by pumping. Further reports on the project covering the outfall and headworks are expected. (Geiger-FRC)

DIRECT POLYMER INJECTION,
Effluent and Water Treatment Journal, Vol 20, No 8, p 397, August, 1980. 1 Fig

Descriptors: *Sludge treatment, *Dewatering, *Polymers, *Injection, *Ultimate disposal, Polyelectrolytes, Treatment facilities, Municipal wastes,

Pumps, Mechanical engineering, Mechanical equipment, Compaction, Compressibility.

The use of polyelectrolytes for the dewatering of sludge in filter presses is rapidly replacing other conventional chemicals. Composting is also being used in many countries with the aid of polyelectrolytes. Early attempts at sludge injection with polyelectrolytes were unsuccessful due to the use of costly separate metering pumps. On a two pump system operating on the same principle as the Willett ram pump, sludge could be sucked in on one pump while the auxillary pump was on the delivery stroke. This pumping unit allowed for adjustments to compensate for day-to-day changes in the rate of dose to dry solids. The system calls for no extra electrical control equipment and may be easily installed to existing systems. The output of filter presses can be increased by improvements in polymer stability and application methods. Results so far from municipal and industrial installations in the United Kingdom on such systems show that improved throughput has been achieved through reduced cycle times. Pre-fill pumps with closed discharge on the bottom filtrate outlets are recommended for new installations. Better moisture distributions and reduced risk of blockages are avoided by prefilling the presses with final effluent to prevent pre-filtration within the press. (Geiger-FRC)

5F. Water Treatment and Quality Alteration

PRODUCTION, FATE AND REMOVAL OF TRIHALOMETHANES IN MUNICIPAL DRINKING WATER SYSTEMS,
Tennessee Univ., Knoxville.
R. A. Minear.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-112443, Price codes: A12 in paper copy, A01 in microfiche. Water Resources Research Center, University of Tennessee, Research Report No 78, April 1980. 253 p, 39 Fig, 44 Tab, 69 Ref, 8 Append. OWRT-A-051-TENN (1), 14-34-0001-0145.

Descriptors: *Trihalomethanes, *Chloroform, Dichloromonobromomethane, Dibromomonochloromethane, Bromoform, Bromide, Humic Acids, *Gas chromatography, *Potable water, *Municipal water, Water treatment.

A two phase project has been conducted that began with a survey of 33 Tennessee drinking water supplies in which the levels of trihalomethanes in the finished water were assayed quarterly for one year. Summer concentrations were found to be much higher than for the other seasons with just less than half of the supplies exceeding 100 mg THM per liter. Only four systems averaged in excess of 100 mg/l for the four quarters and three others were just under this value. Surface raw water sources represented all high THM values while spring and well water sources were typically very low in THM content. NVTOC was found to be strongly related to the THM levels. When THM values were higher, chloroform was the dominant species, however, in a number of systems, bromine containing species were high and frequently the dominant forms. The second phase of the project was an outgrowth of attempts to decipher the variable species distribution. The results indicated that bromide can be an important factor in THM formation.

THE INFLUENCE OF FULVIC ACID ON CU2+, CD2+ AND ZN2+ REMOVAL FROM DRINKING WATER BY ALUM COAGULATION AND CU2+ AND CD2+ COMPLEXING CAPACITY MEASUREMENTS OF FULVIC ACID AND NATURAL FRESHWATER SAMPLES BY DIALYSIS TITRATION,
New Hampshire Univ., Durham. Dept. of Chemistry.
R. E. Truitt.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-111262, Price codes: A09 in paper copy, A01 in michrofiche. PhD Dissertation, 1980. 163 p, 27 Fig, 16 Tab, 133 Ref, 1 Append. OWRT B-004-NH (3), 14-34-0001-8132.

Descriptors: *Water treatment, *Dialysis, *Fulvic acid, Metals, Humics, *Heavy metals, Copper, Cadmium, Zinc, Drinking water, Separation techniques, *Statistical experimental design, Metal ion binding, Complexing capacity, Dialysis titration, Alum coagulation.

Two studies of metal ion complexation by humic material were conducted. In the first, Cu super 2+, Cd super 2+ and Zn super 2+ removal from solution during alum coagulation treatment was measured in the presence and absence of soil-derived fulvic acid (SFA). In a statistically designed experiment, it was found that 6-96% Cu super 2+, -6 to 59% Cd super 2+, and -7 to 82% Zu super 2+ losses were effected. The significant variables were ph, alum dosage, and an interaction effect of SFA level with both ph and alum dosage. In the second study, a dialysis titration technique for the measurement of natural water Cu super 2+ and Cd super 2+ complexing capacity was critically evaluated. Complexing capacities of 6.25 M EDTA, 15.5 M SFA, and 7 freshwater samples were measure. No more than 10% of the SFA binding material permeates the dialysis membrane. Correlation of several water properties reveals that only the Cu super 2+ titration results correlate with ph, alkalinity, hardners and conductance. Color and DOC do not correlate with any water property.

OPTIMUM ALUM DOSE SELECTION FOR THE DURHAM WATER TREATMENT PLANT,
New Hampshire Univ., Durham. Dept. of Civil Engineering.
W. J. Gallot.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-110348, Price codes: A07 in paper copy, A01 in microfiche. Master of Science Thesis, 1980. 136 p, 41 Fig, 14 Tab, 40 Ref, 9 Append. OWRT B-005-NH (2), 14-34-0001-9122.

Descriptors: *Fulvic acid, *Water treatment, Water quality, *Turbidity, *Potable water, New Hampshire, Drinking water, Coagulation, Flocculation, Sedimentation, *Alum, *Color removal, Linear regression equations, Humic substances, Organic color, Raw water quality, Fulvic acid concentration, Absorbance, Aluminum concentration, Suspended material, *Durham(NH).

The purpose was to determine the relationship between the raw water quality and the optimum alum dose for a color removal process. Jar tests were performed on water samples collected at the Durham Water Treatment Plant reservoir. The residual apparent color, apparent fulvic acid concentration, turbidity, absorbance and aluminum concentration were measured. Glass fiber filters were used to simulate the filtration step of the treatment process. A methodology was developed for the selection of the optimum alum dose. The methodology took into account chemical costs, operation costs and the regulatory guidelines and standards for color and turbidity removal. In the majority of the jar test results, the optimum alum dose selection was controlled by color removal. That is when the residual color was minimized the optimum alum dose had been reached. In the remaining jar tests, turbidity removal controlled the optimum alum dose selection. In order to utilize these results in an optimum control strategy, linear regression equations were estimated for the selection of alum dose as a function of the raw water quality. In addition, since ph adjustment is important for optimal performance of the color and turbidity removal process, regression equations for phcontrol were also developed. The effects of temperature upon the control strategy are discussed. Since an automatic control scheme is perceived, the raw water absorbance was used as a surrogate measure of the raw water color. The application of these equations to practical plant operations are discussed.

INFLUENCE OF PH ON DOSAGE REQUIREMENTS OF FERRIC CHLORIDE,
North Carolina State Univ. at Raleigh. Dept. of Civil Engineering.
E. P. Galarraga.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-110355, Price codes: A04 in paper copy, A01 in microfiche. MS Thesis, 1980. 55 p, 17 Fig. OWRT-A-108-NC (1), 14-34-0001-9035.

Descriptors: *Coagulants, *Water supply, *Water treatment, *Hydrogen ion concentration, Chemical precipitation, Ferric chloride, Turbidity removal.

This study investigates the feasibility of reducing the dosage requirement of ferric chloride for the removal of colloidal particles from waters containing low alkalinity by manipulating the pH control of the coagulation process. When metallic salts such as ferric chloride are used as coagulants, the solution pH needs to be maintained at an optimum level to allow the formation of hydroxopolymers or hydroxide precipitates from the added coagulants. Since the chemical reactions result in reduction the solution pH, bases are simultaneously added to maintain a constant pH at the optimum level. The results of laboratory studies indicate that a two-step pH control method can achieve the same removal efficiency as the constant pH method, but at lower dosage requirements. The new two-step pH control technique investigated allows the solution pH to drop to lower levels (e.g. 3.5) during the addition of ferric chloride. It is then adjusted back to the optimum level with the addition of bases. Savings of 15-52% ferric chloride can be obtained, depending on the initial solids concentrations. If the water to be treated contains high suspended solids but low alkalinity, the optimum dosage level of ferric chloride required will be sufficient to reduce the water pH to the desired low levels (e.g. 3-4). Thus, savings of ferric chloride can be achieved simply by delaying the addition of bases required for pH adjustment.

THE CHARACTERIZATION OF FULVIC ACID FRACTIONATED BY GEL PERMEATION CHROMATOGRAPHY,
New Hampshire Univ., Durham. Dept. of Civil Engineering.
R. Bixby.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-113896, Price codes: A06 in paper copy, A01 in microfiche. Master of Science Thesis, 1979. 91 p, 14 Fig, 13 Tab, 59 Ref, 5 Append. OWRT-A-048-NH (2), 14-34-0001-8031.

Descriptors: *Fulvic acids, *Water treatment, *Chemical analysis, *Chromatography, Spectroscopy, Coagulation, *Humic substances, *Chlorinated organics, Gel permeation chromatography, Trihalomethanes, Aluminum sulfate, Chemical structure, Infrared spectroscopy, Ultraviolet spectroscopy, Nuclear magnetic resonance spectroscopy, Hypochlorous acid.

Fulvic acid, the major component of naturally occurring humic substances in water, is both a precursor of chlorinated organics in drinking water and the source of organic color in surface waters. The purpose of this study was to isolate and characterize components of fulvic acid, and relate these findings to water treatment practices for the removal of color, primarily coagulation with aluminum sulfate. Fulvic acid was fractionated into four fractions by gel permeation chromatography. Chemical characterization of each fraction included carbon, hydrogen, nitrogen, water, and ash analyses. The structures of the fulvic acid fractions were elucidated by the use of infrared, ultraviolet, and nuclear magnetic resonance spectroscopy. An aluminum binding study was performed to gain insight into the mechanism of fulvic acid removal during coagulation. The fractions were isolated and found to be discrete components of fulvic acid with different chemical and structural characteristics. Test results indicated that the smallest molecular weight fraction was the most homogeneous, being primarily an aromatic substituted with carboxylate functional groups, and was able to com-

plex more aluminum than any other fraction. It was concluded that fulvic acid cannot be completely nor selectively removed during coagulation with aluminum sulfate, and thus, trihalomethanes will always be produced during disinfection with hypochlorous acid.

MIXED-FORM POLYHALIDE RESINS FOR DISINFECTING WATER,
Aqua-Chem, Inc., Milwaukee, WI. (Assignee).
G. L. Hatch.
U.S. Patent No 4,190,529, 4 p, 4 Tab, 7 Ref. Official Gazette of the United States Patent Office, Vol 991, No 4, p 1368, February 26, 1980.

Descriptors: *Patents, *Water treatment, *Disinfection, Water purification, Bactericides, Anion exchange.

The invention relates generally to the art of water disinfecting and in particular to the use of a bactericidal mixed-form polyhalide resin. A strongly basic anion-exchange resin loaded with iodine and a less than stoichiometric amount of an iodide salt or bromine and a less than stoichiometric amount of bromide sale is an effective demand bactericide for disinfecting water. The bactericidal resin elutes only small amounts of halide ions and is especially suited for killing bacteria in feed water supplies having relatively high salt content. (Sinha-OEIS)
W81-00130

AN AQUATIC FUNGUS FOR BIOLOGICAL CONTROL OF MOSQUITO LARVAE,
Clemson Univ., SC. Water Resources Research Inst.
C. J. Umphlett.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-119307, Price codes: A03 in paper copy, A01 in microfiche. Report No 79, November, 1979. 44 p, 40 Fig, 54 Ref. OWRT-A-031-SC(1).

Descriptors: *Aquatic fungi, *Biocontrol, *Pest control, *Insect control, *Mosquitoes, *Treatment facilities, Freshwater fungi, Fungi, Aquatic life, Aquatic microorganisms, Water pollution sources, Microbiology, Aquatic insects, Testing, Testing procedures, Larvae, Insect eggs, Larvae growth stage, On-site tests, Mortality.

This study sought to evaluate the use of a low level dose of an aquatic fungus, Lagenidium giganteum (LG), for the control of larvae of the Culex pipiens quinquefasciatus (CPQ) mosquito. While the overall project commenced in 1973 with construction completion of an outdoor screened-in test facility in 1974, and establishment of a CPQ colony in 1975, the present report presented information on data collected in the Spring, Summer, and Fall of 1976. Egg counting, pH, air/water temperatures, relative humidity, and fungal introduction were all controlled by the study protocol. Three weeks after inoculation of new CPQ mosquito pools with LG fungus, the adult population had been dramatically reduced in the test chambers. The larvae and pupae were carefully screened to insure that competing parasites were absent. It was concluded that LG can be a significant force against culicine mosquitos when applied and managed properly. Serious consideration for a research program was recommended, including large-scale field testing, which would include development of a type of inoculum and a delivery system suited to large-scale operations. Field testing must be done for the good prognosis observed for LG for population management of selected mosquitoes species to be realized. (Zielinski-IPA)

INACTIVATION OF COXSACKIEVIRUSES B3 AND B5 IN WATER BY CHLORINE,
North Carolina Univ. at Chapel Hill. Dept. of Bacteriology.
H. Jensen, K. Thomas, and D. G. Sharp.
Applied and Environmental Microbiology, Vol 40, No 3, p 633-640, September, 1980. 11 Fig, 1 Tab, 19 Ref.

Descriptors: *Chlorination, *Viruses, *Disinfection, *Chlorine, Sodium chloride, Potassium compounds, Cesium, Water purification, Analytical techniques, Water treatment.

The effects of chlorine disinfection of water on coxsackieviruses B3 (CB3) and B5 (CB5) were evaluated by exposing virus preparations to chlorine solutions in a continuous flow apparatus. Virus inactivation by chlorine in dilute buffer at pH 6 was very similar for CB3 and CB5; the inactivation rate was about half that for poliovirus (Mahoney) under similar conditions. Purified CB3 aggregated in the acid range but not at pH 7 or above, while purified CB5 aggregated in all pH ranges. The log surviving infectivity was graphically plotted as a function of time and resulted in a straight line. Dispersed CB5 provided no chlorine inactivation data because the virus could only be dispersed by diethylaminoethyl dextran, which reacts with chlorine. The aggregation of CB5 or the rate of chlorine action on the viruses was unaffected by the addition of 0.1 M NaCl to the buffer at pH 6. At pH 10, NaCl increased the disinfection activity of OCl(-) by a factor of 20 for both viruses; the addition of cesium chloride had a similar but lesser effect. The addition of KCl had the most rapid inactivation effect of the reagents. The inactivation effects of OCl(-) at pH 10 were equal to those of HOCl at pH 6 in the presence of KCl. (Lisk-FRC)

DESTRATIFICATION OF RESERVOIRS-A DESIGN APPROACH FOR PERFORATED-PIPE COMPRESSED-AIR SYSTEMS,
Water Research Centre, Marlow (England). Medmenham Lab.
J. M. Davis.
Water Services, Vol 84, No 1014, p 497-498, 501-504, August, 1980. 9 Fig, 1 Tab, 9 Ref

Descriptors: *Reservoir storage, *Destratification, *Mixing, *Dissolved oxygen, Design, Aeration, Thermal stratification, Epilimnion, Hypolimnion, Water circulation, Thermocline, Bubbles, Water quality control, Water storage

Artificial mixing devices should prevent thermal stratification and increase dissolved oxygen levels throughout the water column. The perforated-pipe compressed air device is being increasingly used to improve reservoir oxygen content. A summary is presented of the Water Research Centre's experience with perforated pipe systems and useful information is offered to determine the length of perforated pipe and compressor size needed for a particular reservoir. In thermal stratification, the thermocline forms a barrier between the epilimnion and hypolimnion isolating the lower layers of the reservoir from the air at the surface. A typical perforated pipe system in the UK involves a 200-m long pipe closed at one end with small holes which is submerged into the reservoir. Compressed air is pumped through the pipe and the air bubbles released entrain water from the lower levels and carry it to the surface. To apply the mathematical data for the determination of piping needed for a particular reservoir, volume, temperature profile, energy requirements and pressure conditions must be known. Other considerations included are pipe selection, total air flow, anchor weights and costs for equipment and operation of the destratification system. (Geiger-FRC)

5G. Water Quality Control

METHOD OF EFFECTING FLOCCULATION,
Kewanee Industries, Inc., Bryn Mawr, PA. (Assignee).
H. A. Green, J. J. Merianos, and A. N. Petrocci.
U.S. Patent No 4,188,293, 3 p, 6 Ref; Official Gazette of the United States Patent Office, Vol 991, No 2, p 620-621, February 12, 1980.

Descriptors: *Patents, *Water treatment, Water quality control, *Flocculation, Surfactants, Emulsions, Chemical reactions, Industrial water.

Another use for the compounds of this invention, or mixtures of such compounds, is for flocculation in aqueous systems. As flocculants, they cause the sedimentation of some materials which might otherwise remain in aqueous suspension; or, at least, they increase the rate of sedimentation in many cases where continued suspension of such immiscible materials cause a problem when it is desired to clarify and draw off the clear supernatant aqueous solutions or when it is desired to filter or drain suspensions in industries that require large volumes of water. The compounds also may be used to clarify waters in which the pollutants are emulsified. In such cases, the compounds may cause the emulsion to break. (Sinha-OEIS)
W81-00123

ROTARY FILTER APPARATUS,
T. Hagihara.
U.S. Patent No 4,188,294, 11 p, 24 Fig, 6 Ref; Official Gazette of the United States Patent Office, Vol 991, No 2, p 621, February 12, 1980.

Descriptors: *Patents, *Water quality control, *Water pollution treatment, Filtration, Filters, Equipment, Channels, Running water.

A rotary filter apparatus is installed in a water channel in order to arrest, transport and dump the solids in the water currents while reconditioning the filter meshes for continuous operation. The apparatus includes an endless belt composed of many linking rods, linking plates, wire ropes or screen plates, and specially-shaped filter plates rockably fitted on the linking rods. The filter belt travels through the frame that can differentiate the track from the track of the filter plates. (Sinha-OEIS)
W81-00124

METHOD OF CONCENTRATING AND COLLECTING OIL SPILLS,
CIBA-GEIGY Corp., Ardsley, NY. (Assignee)
R. A Falk
U.S. Patent No 4,190,531, 9 p, 5 Tab, 3 Ref. Official Gazette of the United States Patent Office, Vol 991, No 4, p 1369, February 26, 1980.

Descriptors: *Patents, *Oil pollution, *Oil spills, *Water quality control, Oil-water interfaces, Films, Surface tension, Chemical reactions, Surface active agents, Fluorochemicals

Oil spills can be more effectively concentrated, collected, and controlled by employing a durable, rapidly spreading, water-insoluble surface film comprised of a fluorochemical. The fluorochemical agent has a density greater than water, a solubility of less than 0.01% in water, a spreading pressure, and is applied with a diluent to form a highly mobile film under actual field conditions Useful fluorochemicals are especially effective under adverse environmental conditions, and in combination with mechanical cleanup devices. (Sinha-OEIS)

THE APPLICATION OF PROJECT ANALYSIS TO NATURAL RESOURCE DECISIONS,
Minnesota Univ., St. Paul. Dept. of Agricultural and Applied Economics.
K. W. Easter, and J. J. Waelti.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-112658, Price codes: A05 in paper copy, A01 in microfiche. Water Resources Research Center, University of Minnesota, St. Paul, Bulletin Number 103, June 1980. 181 p. OWRT-A-999-MINN (50).

Descriptors: *Project planning, *Project analysis, *Project evaluation, *Cost-benefit analysis, Economics, Cost allocation, Irrigation, Navigation, Flood control, Recreation and environmental resources, Uncertainty, Externalities, *Water resources development.

This publication is intended to serve as a guide for the application of water project planning and analysis. Included are a perspective from which to review economic decisions; a brief history of evaluation procedures for U.S. water projects; a description of the Water Resources Council's procedures; the basic economics of project evaluation; problems in cost allocation; and individual applications to irrigation, flood control, navigation and related transportation, and recreation and environmental resources. Emphasis is placed on social benefits measured in terms of additions to real product and savings in terms of real resources.

Sediments of Cretaceous to Holocene age compose the Northern Atlantic Coastal Plain aquifer system in an area of 50,000 square miles in parts of New York, New Jersey, Delaware, Maryland, Virginia, and North Carolina. The aquifer system is a major source of water supply in the area. About 1.4 billion gallons is withdrawn from its aquifers each day. Increasing withdrawal of ground water has created or intensified several problems such as declining water levels, development of large cones of depression, saltwater intrusion, spreading of ground-water contamination, and land subsidence. The U.S. Geological Survey has begun a comprehensive study that will define the geology, hydrology, and geochemistry of the aquifer system. The effects of future utilization of the aquifer system will be determined and alternative plans for water withdrawal will be evaluated through computer simulation modeling. This report describes the objectives, organization, and work plans of the study. (USGS)

TECHNOLOGY FORECASTING IN WATER RESOURCE PLANNING,
Iowa State Univ., Ames. Dept. of Industrial Engineering.
R. Viathionathan, R. Berger, and T. A. Austin.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-115669, Price codes: A07 in paper copy, A01 in microfiche. Iowa State Water Resources Research Institute, Iowa State University Completion Report, July 1980. 133 p, 14 Fig, 9 Tab, 55 Ref, 6 Append. OWRT-A-057-IA(2), 14-31-0001-5015.

Descriptors: *Forecasting, *Mathematical models, *Water distribution(Applied), *Technology, *Water resources planning, Methodology, Prediction, Future planning(Projects), Planning, Projections, Risks, Computer models, Iowa, Water resources, Irrigation, Consumptive use, Water resources development, Industry, Agriculture, Farming.

This report was a completion report for a three-year research project on technological forecasting methodologies in water resource planning, conducted in three phases: (1) investigation of various types of forecasting methodologies and development of an overall forecasting/planning system (containing exploratory and normative forecasting segments) applicable to water resource planning; (2) methodologies proposed in the exploratory segment were modified and tested in phases 2 and 3, and the Delphi technique was used to study the quantitative future of water withdrawal in the Iowa meat packing industry; and (3) several exploratory segment methodologies, integrated into a forecasting system, were used to forecast future irrigated acreage in six Western Iowa counties (Fremont, Harrison, Mills, Monoa, Pottawattamie, and Woodbury). Computer-based simulation of past data and subjective opinions of 'experts' were used to obtain scenarios of both the qualitative and quantitative future. The report concludes that there is a definite role to be played by technology forecasting. Conscientious and knowledgeable application of the described tools by water resource personnel can significantly aid the planning process. (Zielinski-IPA)

SYSTEMS ANALYSIS OF URBAN STORM WATER DETENTION BASINS,
Booker Associates, Inc., Lexington, KY.
D. K. Mynear, and C. T. Haan.
Transactions of the American Society of Agricultural Engineers, Vol 23, No 1, p 112-116 and 120, January-February 1980. 3 Fig, 3 Tab, 11 Ref. OWRT B-046-KY(6).

Descriptors: *Detention reservoirs, *Systems analysis, *Storm runoff, *Urban runoff, Structures, Hydraulic structures, Dams, Design, Planning, Model studies, Mathematical models, Drainage, Floods, Flood control, Design storm, Flood peak, Watersheds(Basins), Detention basins.

Urban storm water detention basins are generally designed without consideration being given to the overall effect and cost of several basins within a single watershed. By considering a system of basins, the total effectiveness of the basins can be increased while the costs are reduced. Computer programs and procedures are presented that make it possible to find a least cost system of detention basins that will control increased flows from urban areas to a predetermined level. DEMAND-ELASTICITY-CONSERVATION RELATIONSHIPS,
M. B. Sonnen.
In: Proceedings of the Conference on Water Conservation Needs and Implementing Strategies, July 9-13, 1979. Franklin Pierce College, Rindge, NH, p 211-217, 1979. 3 Tab, 2 Ref.

Descriptors: *Land use, *Water conservation, *Mathematical models, Honolulu, Hawaii, Water demand, Numerical analysis, Probability, Equations, Hydrologic data, Agriculture, Political aspects, Land classification, Forecasting, Planning.

An algebraic analysis of the variables that affect water demands is used to show that water conservation may be a somewhat unsteady, infirm, incomplete, unstable cornerstone for our national water policy. A mathematical model designed to solve the monthly relationship between demand and supply for any particular land use category is described. The model can also describe this monthly relationship over a period of years. The complex expression illustrates that the factors of indoor conservation (CI) and outdoor conservation (CO) alone cannot be relied upon to slow the taking of water. The model equation can be differentiated for each independent variable to show which factors control either positive or negative demand. Also, the elasticity of demand factor can be derived for each variable. A calibration exercise was conducted for the Honolulu area where measured demand data were available. Elasticities of demand with respect to variables other than conservation percentage are calculated. The model shows that land use, although politically unpopular, is the most promising way to curtail water demand. Also, land use will be more effective than price increases or the installation of water saving devices. (See also W81-00160) (Seigler-IPA)

RISK MANAGEMENT IN WATER SUPPLY PLANNING,
Washington Suburban Sanitary Commission, Hyattsville, MD.
R. S. McGarry.
In: Proceedings of the Conference on Water Conservation Needs and Implementing Strategies, July 9-13, 1979, Franklin Pierce College, Rindge, NH, p 228-244, 1979. 3 Fig, 5 Tab, 2 Ref.

Descriptors: *Washington(DC), *Cities, *Water policy, *Water supply, Task forces, Reservoirs, Potomac River, Droughts, Water shortage, Planning, Urbanization, Forecasting, Water demand, Federal Government, *District of Columbia Metropolitan Area.

The Bi-County Water Supply task force has made marked progress in solving the serious water supply shortage situation of the Washington, DC. metropolitan region. This process comes after 20 years of review and study with no action being taken. The Corps of Engineers, the Congress, and other Federal interests were not close enough or responsible enough to act on the community water supply problem. A citizen's advisory committee also played a major role. In October 1977 a thorough analysis of the supply and demand situation was accepted as showing a major problem in supply. The task force then had two management scenarios developed against which various supply alternatives were measured for feasibility and cost. Of 25 alternatives originally available, all but 7 were rejected for political or regional environmental reasons. The remaining 7 alternatives were for high flow skimming techniques, new storage reservoirs, or a groundwater possibility. The task force selected the alternative that caled for the utilization of a formerly planned Soil Conservation Service reservoir. Federal funding was abandoned and the reservoir will be locally financed. Land is

being acquired and the reservoir is being designed. The success of the task force illustrates that water supply planning is no longer an engineering problem, it has become a political, social, economic, environmental problem. (See also W81-00160) (Seigler-IPA)

FIVE YEAR RESEARCH PROGRAM 1982-1987: NEW HAMPSHIRE WATER RESOURCE RESEARCH CENTER,
New Hampshire Univ., Durham. Water Resource Research Center.
S. H. Higgens, R. R. Stever, and J. B. Hraba.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-111577, Price codes: A06 in paper copy, A01 in microfiche. Report submitted to Office of Water Research and Technology, October, 1980. 103 p, 11 Fig, 1 Map. 14-34-0001-0131.

Descriptors: *Research priorities, *Water resources, *Water resources institutes, Water Resources Research Act, Water policy, Water management, *New Hampshire, *State water problems, *State water needs, Institutional survey.

Pursuant to the Water Research and Development Act of 1978, a five-year research program was developed for the New Hampshire Water Resource Research Center. The study was submitted to the U.S. Department of the Interior, Office of Water Research and Technology (OWRT), for inclusion in a national plan. Water-related research needs were assessed through the Center's ongoing needs assessment process, augmented by an intensive survey of Federal, State, regional, local, and private institutions involved with water-resources in New Hampshire. The survey spanned a period of eight months, involving over 30 interviews and 35 responses from a mailed questionnaire. In addition, an exhaustive survey of the literature addressing water-resources management, planning and research in the State was undertaken. An analysis of the New Hampshire Water Resource (Section II), its uses (Section III), and the related management and planning mechanisms (Section IV), revealed a comprehensive list of water-related problems and research needs (Section V). Water-related problems and needs were grouped into six catagories: water quality, water supply, natural resources and ecology, energy development, recreation, and flood control. From this statewide tabulation, a subset of problems and needs were selected to be addressed in the Center's five-year research program (Section VI). The selection of research needs was based upon compatibility with the mission and goals of the Center, research capabilities at academic institutions in the State, other ongoing research efforts, and funding availability through the Center.

Descriptors: *Cost-benefit analysis, *Theoretical analysis, *Water resources, *Project post-evaluation, *Project planning, Model studies, Projects, Programs, Decision making, Project benefits, Project purposes, Environmental control, Econometrics, Welfare(Economics), Economies, Resources, Sulfur compounds, Air pollution, Computer models, Pollutants.

A major problem in water resource planning and project evaluation is lack of a common denominator for use in summarizing the various accounts, especially national economic development and environmental quality accounts, required by Principles and Standards promulgated in 1973. The Tiebout hypothesis, which relates an individuals' choice of residence with Quality of Life (QOL) factors, was extended empirically by evaluating tradeoffs between QOL factors to determine the practicability in using this as an approach to overcome the problem of incommensurates in water resource project evaluation. Application of this hypothesis to evaluation of water resource projects raised major econometric and data problems, and only limited success was achieved in this research. Practical data and measurement problems required that the analysis focus on ambient sulfur dioxide (SD) as the QOL factor under study. The computed exchange rates (between monetary income and ambient quality) ranged from $3 to $33/capita/ton SD/sq mi. While there was no formal test of these rates, they were evaluated relative to their usefulness and reasonability. Additional research was suggested for refining econometric tools and improving data accuracy, but it was tentatively concluded that the Tiebout hypothesis can provide a practical aide in project evaluation. DEVELOP WATER MANAGEMENT METHODS FOR WATERSHEDS SUBJECT TO INTENSIVE DEVELOPMENT,
Arizona Univ., Tucson. Dept. of Hydrology and Water Resources.
D. Davis, and H. B. Robotham.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-114837, Price codes: A04 in paper copy, A01 in microfiche. Partial Project Completion Report, September, 1980. 58 p, 13 Fig, 13 Tab, 23 Ref, 1 Append. OWRT-A-069-ARIZ(3), 14-34-0001-6003.

Descriptors: *Water management(Applied), *Watershed management, *Algorithms, *Reservoir construction, Water resources, Economic evaluation, Water demand, *Arizona, Computer programs, Water supply development, Alternate water use, Area redevelopment, Water utilization, Estimating, *Sonorita Creek watershed(AZ).

This study, undertaken due to increased concern over the adequacy of the Sonorita Creek watershed in meeting future water demands in the Patagonia-Sonorita area in Arizona, investigated various water resources management alternatives for the watershed. While agricultural and recreational demands are expected to remain fairly constant, municipal and domestic demands are expected to triple over the next twenty years. Six potential water resources management alternatives were developed and compared using standardized cost-effectiveness methodology, allowing for intercomparisons of these alternatives with respect to quantifiable and inquantifiable criteria. Each alternative considered development of either ground-water or surface water resources of the watershed, as well as a method for disposal of treated sewage. Selection of a watershed plan was made using the ELECTRE I algorithm, due to its established utility in multiobjective decision problem analysis. Based on use of available ground and surface water resource information for the watershed with this approach, the most optimum alternative specified construction of a small reservoir at Redrock Canyon having evaporation control measures as a supplemental water source for Patagonia, Arizona, and for the Sonorita Creek Sanctuary. CHARACTERIZATION AND LAND APPLICATION OF SEAFOOD INDUSTRY WASTEWATERS,
North Carolina State Univ. at Raleigh. School of Agricultural and Life Sciences.
M. R. Overcash, and D. Pal.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-114654, Price codes: A03 in paper copy, A01 in microfiche. Water Resources Research Institute, University of North Carolina. Report No 142, August 1980. 33 p, 7 Fig, 9 Tab, 16 Ref. OWRT-B-100-NC(10), 14-34-0001-7173.

Descriptors: *Industrial wastes, *Commercial fishing, *Seafood industry, *Waste assimilative capacity, Methodology, Nutrients, Wastes, Waste identification, *Land management, Sites, Soil types, Clay loam, Sandy loam, Shrimp, Crab, Tuna, Oyster.

Soil-plant systems are capable of utilizing seafood industry waste water with little or no pretreatment requirements. Raw waste from seafood processing plants contain substantial plant nutrients including nitrogen, phosphorus and calcium. In calculating a capacity for soil-plant assimilation of waste effluents, land areas necessary for the environmental compatible operation of a treatment site were estimated. Four segments of the seafood processing industry: (shrimp, crab, tuna and oyster) were selected for land treatment evaluation. Bulk volume and composition of waste were characterized for average size plants. One objective was to further demonstrate the utility of a recently developed complete design procedure for land treatment of the entire waste stream from any given industry Two common soil characteristics were focused on as representing significantly different soil textures: (1) a sandy loam, and (2) a clay loam soil. When compared to a sandy loam site, a clay loam site reduced the land needs for shrimp and crab processing. It had no effect on tuna wastes. Oyster land areas were increased in going to a clay loam site. It is generally recommended that a detailed design is needed prior to land treatment because of probable variations in site and waste characteristics. (Stiles-IPA)

ANALYSIS BARRIERS TO IMPROVING THE HYDROELECTRIC POWER INTERFACE WITH ELECTRIC POWER SYSTEMS,
Camp Dresser and McKee, Inc., Waltham, MA
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-117244, Price codes: A05 in paper copy, A01 in microfiche. Final Report prepared for the Office of Water

Research and Technology, September 30, 1980. 87 p. OWRT-C-90237-T(no 9625)(1), 14-34-0001-9625.

Descriptors: *Hydroelectric power, *Electric power production, *Electric power industry, Analysis, Reservoir storage, Pumped storage, Utilities, Constraints, Optimization, *Hydro/thermal scheduling, Load management, Economic dispatch, Demand forecasting, Unit commitment, Public Utilities Regulatory Policy Act of 1978, Analysis barriers.

The analysis barriers to improving the interface of hydroelectric power with electric power systems are investigated and discussed. The value of hydropower to society and the utilities is explored touching on the problems of weather and hydrological dependencies, multiple-use conflicts and engineering aspects. Special attention is afforded to the organizational structure of the electric utility industry and the operational and planning functions as they relate to hydroelectric power production. Analytical approaches taken to optimize the use of hydropower over time are surveyed. Current barriers to these approaches are presented along with future research topics which potentially may alleviate them.

PREDICTING WATER USE CONSIDERING CONSERVATION,
Johns Hopkins Univ., Baltimore, MD.
J. J. Boland, and P. H. Carver.
In: Proceedings of the Conference on Water Conservation Needs and Implementing Strategies, July 9-13, 1979, Franklin Pierce College, Rindge, NH, p 88-93, 1979. 1 Tab, 8 Ref.

Descriptors: *Water conservation, *Water utilization, *Mathematical models, *Forecasting, Estimating, Water supply, Measurement, Water demand, Planning, Equations, Water users, Water rates, Water allocation, Disaggregate demand forecasts.

An expression for the prediction of the effectiveness of water conservation measures is discussed and defined as the quantity of water per unit time which is expected to be saved through implementation of a measure. Conservation measures are classified by the user class affected and by the time of implementation. In general quantitative estimates are deficient because they are 'a priori' engineering estimates, are based on casual empiricism, or are stated in terms of water use at an inappropriate level of aggregation. Water conservation measures may be classified as behavioral modification such as improved use practices, leak repair, economic incentives, and water use regulation or as technological change such as water-saving toilets, faucet aerators, and the substitution of other inputs. A two step procedure is needed for forecasting. First unrestricted water use must be estimated then the aggregate effectiveness of the conservation measures can be determined and deducted to yield a future forecast. General conclusions concerning forecasting are that water conservation measures must be explicitly considered in forecasting future water use, a disaggregate demand approach should be used instead of the widely-used per capita requirement approach, and more data and research are needed on disaggregate demand forecasts and on actual applications of conservation measures. TECHNOLOGY ASSESSMENT FOR WATER RESOURCE MANAGEMENT IN URBANIZING AREAS,
Gates (W.E.) and Associates, Inc., Fairfax, VA.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-119570, Price codes: A04 in paper copy, A01 in microfiche. Completion Report presented to Office of Water Research and Technology, September, 1980. 69 p, 4 Fig, 335 Ref. OWRT-C-90226-T (No 9626)(1).

Descriptors: *Water resources, Mathematical models, *Urbanization, *Evaluation, *Hydrology, *Water supply, *Water sources, *Recreation, *Institutions, Technology, Methodology, Research and development, Planning, Water resources development, Mathematical studies, City planning, Urban hydrology, Urban sociology, Suburban areas, Statistics, Statistical methods.

This technology assessment focused on an evaluation of existing technologies for water resource management in urbanizing areas and the development of recommendations for research priorities that would enhance the technologies. The water resource management elements studied were hydrology, water supply, nonpoint sources, recreation, and institutions. Two distinct approaches to water resource management in urbanizing areas were considered: (1) the economic (demand) approach (required carrying capacity supplied by a combination of resident capacity and capacity derived through various service delivery systems); and (2) the ecologic (control) approach (carrying capacity fixed at a prescribed level). The existing technologies were viewed within four states of understanding: phenomenological, empirical, statistical, and deterministic. Recommendations for the five management elements were formulated. These were for research on application of spatial processes suggested in the Hewlett phenomenological model (hydrology); on conceptualization of a watershed as a reactor and its characterization (nonpoint sources); on phenomenological model development (recreation); on implications of removing institutional constraints on implementing technologies (water supply); and on the timing and geographic extent of water resource management institutions (institutions). AN ASSESSMENT OF NONPOINT SOURCE TECHNOLOGY FOR WATER RESOURCE MANAGEMENT IN URBANIZING AREAS,
Gates (W.E.) and Associates, Inc., Batavia, OH.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-118788, Price codes: A04 in paper copy, A01 in microfiche. Completion Report prepared for Office of Water Research and Technology, September, 1980. 68 p, 1 Fig, 1 Tab, 41 Ref, 1 Append. OWRT-C-90226-T(No 9626)(1).

Descriptors: *Water resources, *Mathematical models, *Urbanization, *Evaluation, *Water sources, Hydrology, Water supply, Recreation, Institutions, Technology, Methodology, Research and development, Planning, Water resources development, Mathematical studies, City planning, Urban hydrology, Urban sociology, Suburban areas, Statistics, Statistical methods.

Fourteen comprehensive models of the nonpoint source process were reviewed, and their space-time characteristics and component processes described (Appendix:31 p, 8 tab, 11 fig). With only one exception, comprehensive model components were empirical or deterministic, with the current trend being the use of deterministic relationships. This exception, the ADAPT statistical NPS model, should have resulted in more operational models in light of the large field data sets (urban and rural) collected over the past decade. The empirical-deterministic component formulations were all generally derived from a few basic models. Also, there appeared to be a trend towards greater incorporation of spatial characteristics in more recent models. Historically, nonpoint source research has been segregated into three areas: urban analysis, sediment modeling, and chemical modeling. A minimal level of evolutionary conceptual research has occurred relative to the work spent on aggregting modules within these three areas into a comprehensive model, and emphasis more on mathematical models than on conceptual understanding has led to significant problems greatly affecting the capacity to model nonpoint sources. The primary research requirement is to establish a common framework in which nonpoint source research and modeling may be placed. A proposed watershed reactor concept provides such a general framework. (Zielinski-IPA)

TECHNOLOGY ASSESSMENT OF HYDROLOGY FOR WATER RESOURCE MANAGEMENT IN URBANIZING AREAS,
Gates (W. E.) and Associates, Inc., Batavia, OH.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-118754, Price codes: A05 in paper copy, A01 in microfiche. Completion Repot prepared for Office of Water Research and Technology, September, 1980. 11 p, 1 Fig, 32 Ref, 1 Append. OWRT-C-90226-T(No 9626)(1).

Descriptors: *Urban hydrology, *Water resources, Rainfall-runoff relationships, *Mathematical models, Urbanization, Evaluation, Surface-groundwater relationships, Water supply, Water sources, Recreation, Institutions, Technology, Methodology, Planning, Water resources development, Mathematical studies, City planning, Hydrology, Statistics, Suburban areas, Research and Development.

The historical development of rainfall-runoff models is discussed (Appendix: 33 p, 24 fig, 78 ref.) with emphasis placed on the evolution of the models and their responsiveness to the changing spatial requirements in rainfall-runoff and nonpoint source modeling. Primary emphasis in hydrologic analysis has been rainfall-runoff modeling; the prediction of how a watershed/catchment transforms rainfall into stream flow. Model development occurs through an iterative process involving phenomenological, statistical-empirical, and deterministic model forms. Rainfall-runoff modelling is currently in a stage in the iterative development process between two phenomenological models. All operational rainfall-runoff models are largely based on the outdated Horton model, while broad-based general acceptance has occurred for the spatially-based Hewlett model. It would appear that the major need today in rainfall-runoff modelling is in research to understand and formalize the spatial processes suggested in the Hewlett model. A requisite to construction of a complete phenomenologic model are data on the actual spatial/temporal path followed by water under a wide range of physiographic conditions. Field work using tracers was suggested as one means of developing such data. (Zielinski-IPA)

LITERATURE REVIEW FOR WATER SUPPLY FOR URBANIZING AREAS,
Howard (Charles and Associates Ltd., Vancouver (British Columbia).
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-119547, Price codes: A03 in paper copy, A01 in microfiche. W. E. Gates and Associates, Inc., Fairfax, VA. Completion Report prepared for Office of Water Research and Technology, September, 1980. 25 p, 6 Fig, 2 Tab, 115 Ref. OWRT-C-90226-T(No 9626)(1).

Descriptors: *Publications, *Reviews, *Water supply, *Urbanization, *Statistical methods, Water resources, Evaluation, Hydrology, Urban hydrology, Water sources, Recreation, Institutions, Technology, Methodology, Research and Development, Planning, Water resources development, Mathematical studies, City planning, Suburban areas, Statistics.

This study involved the development of recommended strategies for future research investment in water sources for urbanizing areas, providing background information related to water supply, treatment, and distribution. To quantify the recommendations, the most recent literature in the field was summarized, classified, and analyzed to identify past research trends. The review was confined to articles published within the last two years, covering 450 articles for analysis by multiple classification systems and a statistical approach. Fifty-one of these, published between 1978-1980 dealt with some type of problem associated to water resources for urbanizing areas; the remainder dealt primarily with industry or pure hydrology related problems. Information extracted from the 51 articles were classified using four independent schemes: primary subject matter, level of specificity, level of sophistication, and author's research approach. Each article was read and classified in all four schemes. Most research was found in the water treatment field, compared to water supply quantity aspects. The literature indicated that im-

plementation of existing technology, especially during draught periods, represented troubled areas. (Zielinski-IPA)
W81-00193

TECHNOLOGY ASSESSMENT AND RESEARCH NEEDS OF WATER-BASED RECREATION FOR URBANIZING AREAS,
Wright-McLaughlin Engineers, Denver, CO.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-118812, Price codes: A07 in paper copy, A01 in microfiche. W. E. Gates and Associates, Inc., Fairfax, VA. Completion Report prepared for Office of Water Research and Technology, September, 1980. 141 p, 22 Fig, 1 Tab, 49 Ref, 1 Append. OWRT-C-90226-T(No 9626)(1).

Descriptors: *Recreation, *Water supply, *Urbanization, *Water sports, *Research priorities, *Land use, *Statistical methods, Water resources, Evaluation, Hydrology, Water sources, Institutions, Technology, Methodology, Research and Development, Planning, Water resources development, City planning, Urban hydrology, Suburban areas, Statistics.

The recreation planning process was studied with special emphasis on its application to urbanizing areas and on water-based recreation. Available technologies were examined as to how each fits within the planning process. A description of the methodology of each with examination of its level of sophistication was carried out (phenomenological-empirical-stochastic-deterministic), and critiqued to identify potential research areas. Nine suggested research areas were prioritized by evaluation of the probable value derived from research expenditures. The highest priority was general research for a coordinated comprehensive approach to general land use planning for urbanizing areas, prior to the undertaking of more detailed research into specific areas. Other suggested priorities included a substantial improvement in economic variation of the whole planning process for urbanizing areas, and improvement in application of the survey method to improve the definition of desires and needs of a future population. A comprehensive bibliography on recreation planning (325 references) is given in the appendix. (Zielinski-IPA)
W81-00194

EXISTING BASE AND RELEVANT PRACTICES -- INSTITUTIONAL ARRANGEMENTS FOR WATER RESOURCE MANAGEMENT IN URBANIZING AREAS,
Robinson, Farmer, Cox Associates, Richmond, VA.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-119562, Price codes: A03 in paper copy, A01 in microfiche. W. E. Gates and Associates, Inc., Fairfax, VA. Completion Report prepared for Office of Water Research and Technology, September, 1980. 45 p, 3 Tab. OWRT-C-90226-T(No 9626)(1).

Descriptors: *Institutions, *Urbanization, *Water resources, *City planning, *Water supply, *Evaluation, Hydrology, Water sources, Technology, Methodology, Research and Development, Planning, Water resources development, Statistical methods, Urban sociology, Suburban areas, Water management.

Specific problems seen in other areas of the study (water supply, drainage, nonpoint source pollution and water-based recreation) were seen as being able to be remedied by improving the powers, geographical jurisdiction, and timing of institutions intended to manage a water resource. It was concluded that there is political support for their exercise. Research concluded as being helpful to these areas was identified in a list of twelve program reseach elements. These research elements included: investigating the divergence in popular opinion that regional water resources agencies are better, yet such institutions are rarely found; determining how institutions can be organized and established sufficiently early in the urbanization process for design and construction of institutions in an urbanizing area; devising state or other supralocal strategy for establishing timely, effective, and appropriate local institutions for water resource management in urbanizing areas; and describing the impact of water resources on the real estate market during the urbanization process. 6C. Cost Allocation, Cost Sharing, Pricing/Repayment

WATER DISTRICT REVENUE IMPLICATION OF CONSERVATION,
East Bay Municipal Utility District, Oakland, CA.
D. G. Larkin, and K. E. Carns.
In: Proceedings of the Conference on Water Conservation Needs and Implementing Strategies, July 9-13, 1979, Franklin Pierce College, Rindge, NH, p 204-210, 1979. 1 Tab

Descriptors: *California, *Water conservation, *Water rates, *Economic impact, Prices, Water utilization, Utilities, Water works, Droughts, Water shortage, Costs, Income, Planning, Profit, Economic prediction

Water conservation is the single most important factor which has triggered revenue problems for the East Bay Municipal Utility District in Oakland, California. Following the 1976-1977 drought, water consumption levels have not returned to predrought levels and are now at about 83% of the normal pre-drought level. Consumption is expected to rise only to 90% of normal in the early 1980's despite increasing numbers of customers. Customers' water bills have increased from the predrought level of $4.70/month to the current $7.00/month to help offset the financial losses due to conservation. An even greater increase has occurred in industrial and commercial bills. Revenue problems caused by conservation have been further heightened by inflation, Proposition 13, delayed rate increases, and the development of new water risk schedules. Innovative utility financial policies will be needed to meet the increasingly unpredictable future. Conservation must be considered in planning and more frequent reviews of water rates will have to be conducted. (See also W81-00160) (Seigler-IPA)

OWRT A-037-PA(1), 14-34-0001-9040.

Descriptors: *Water resources development, *Rural areas, *Analysis, *Pennsylvania, *Water supply development, Water utilization, Sewerage, State involvement, Evaluation, Rural water problems, Water firms, Capital subsidies, State financing, Sanitarians.

An institutional and theoretical analysis is presented of the role that states should play in providing water to rural areas. The research question addressed is: If private suppliers are to continue providing water in rural areas, is a subsidy system necessary or desirable. The initial conception of this question was made by the Water Supply Task Force Committee (WSTFC) of the state of Pennsylvania. In response to the research needs stated by WSTFC, the analysis done here is predominantly economic in perspective. Several social, political, and engineering aspects of the problem are left unaddressed. The analysis is conducted in two parts: (1) an evaluation of the historical record of state involvement in rural water problems, surveying all the states to assess their comparative record of involvement; and (2) an analysis of both the theoretical values and appropriate limitations of state involvement.

FIVE-YEAR WATER RESOURCES RESEARCH AND DEVELOPMENT PLAN FOR THE STATE OF MONTANA,
Montana State Univ., Bozeman. Water Resources Research Center.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-119596, Price codes: A04 in paper copy, A01 in microfiche Report submitted to the Office of Water Research and Technology, October, 1980. 47 p, 1 Fig, 2 Tab, 28 Ref, 8 Append. 14-31-0001-0128.

Descriptors: *Research priorities, *Montana, *Research and Development, *Planning, *Water resources, Institutions, Local governments, Federal government, Operations, Project planning, Water resources development, Water supply, Water sources, Potential water supply, Scheduling, Programs, Forecasting, Reservoirs, Water consumption, Agricultural watersheds, Irrigation.

The report, developed to meet requirements of the Water Research and Development Act of 1978, documented Montana water resources and related land-use problems, and presented a prioritized research agenda to improve a comprehensive planning/management program to meet Montana's water resources needs. Agriculture is the major water consumer, accounting for 95 percent of the water used in the State. Reservoirs provide about 28 million acre-feet of live storage in order to maintain streamflow through the summer in major streams, yet major problems occur in provision of water qualities needed during low flow periods in needed locations. Sufficient unappropriated water is available for increased uses at present and for demands projected through the year 2020. The major water-related problems lay in providing water in locations where it is needed when it is needed. The five-year program recommends that funding of the Water Center research projects be encouraged in support of agencies engaged in studies most critical to State, regional, and national water problems. The most significant water quality problems identified were from sediments and salts from nonpoint pollution sources, and from reduced streamflows due to withdrawals. (Zielinski-IPA)

THE POLITICAL FEASIBILITY OF ALTERNATIVE STRATEGIES FOR MANAGING WATER DEMAND IN SOUTHERN ARIZONA,
Arizona Univ., Tucson. Dept. of Political Science
J. R. McCain.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-109803, Price codes: A04 in paper copy, A01 in microfiche Project Completion Report, September 15, 1980. 45 p. OWRT A-085-ARIZ(2), 14-34-0001-8003.

Descriptors: *Political aspects, *Water law, *Water demand, Pricing, Planning, *Water resources development, *Arizona, Water management problems, Decision making, Water policy.

Decision-makers are restricted in their choice of alternative policies by physical, economic, attitudinal and legal/institutional constraints, all of which may or may not be operative in any particu-

lar situation. This report examines the interrelationships between attitudinal and legal constraints in the context of policies for the local development, use and management of water resources in Tucson, Arizona. The attitudinal constraints are identified as those images or beliefs which compose the 'water-is-different' syndrome--specifically the 'free-good,' 'desert,' and 'survival' images of water. The legal/institutional constraints are discussed in terms of water laws--both statutory and common. The effect of these constraints on water policy, in Tucson and elsewhere, has been to emphasize supply solutions to water management problems. Demand management strategies have traditionally been avoided in water policymaking. In 1976, however, public officials in Tucson did develop and implement policies aimed at reducing demand for water. Although these demand management policies appear to have been ultimately successful, the changes did not come without costs. The innovative actions of these public officials precipitated a political crisis in which they were actually turned out of office. Ironically, this crisis may have also had the unexpected effect of institutionalizing a demand management system in Tucson.

SOME IMPLICATIONS OF WATER LAW AND RIGHTS TOWARDS LAND USE PLANNING: VERMONT CASE STUDIES,
Vermont Univ., Burlington.
P. J. Folkman.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-111270, Price codes: A05 in paper copy, A01 in microfiche. MS Thesis, 1980. 86 p, 4 Fig, 2 Tab, 128 Ref. OWRT-A-035-VT (1), 14-34-001-9048.

Descriptors: *Water law, *Water resources planning, *Land use, *Riparian land, Watercourses(Legal aspects), Common law, Water pollution control, Surface water availability, Groundwater availability, Vermont water law, Winooski River(VT).

A theory that water law and rights have an effect on land use planning and therefore should be included as a component in the land use planning process is proposed. Research presented summarizes Vermont's common, statutory, and administrative water laws and rights. Three Vermont case studies are examined which substantiate the proposed theory. The case study examples include a diversity of water resources and laws such as: running waters (rivers) and administrative law; standing surface water (lake) and administrative and statutory law; and ground water and the common law. The case studies identify some implications these various water laws have on the land use planning process. The primary conclusion is that a review of water laws and rights should occur at the data collection stage in the land use planning process to preclude land use planning and water law conflicts.

LEGAL AND PROCEDURAL PROBLEMS OF THE ADMINISTRATION AND ENFORCEMENT OF WATER RESOURCES LAWS AND REGULATIONS,
West Virginia Univ., Morgantown. Water Research Inst.
V. P. Cardi.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-110744, Price codes: A03 in paper copy, A01 in microfiche. Technical Completion Report, 1980. 33 p. OWRT-A-027-WVA (1), 14-31-0001-5059.

Descriptors: Administrative decisions, Judicial decisions, Law enforcement, *Legal aspects, Regulation, *West Virginia, *Water law, *Water pollution, Adjudication procedure, Administrative agencies, Decision making, Local governments, Legislation, Management, Penalties(Legal), Political aspects, Sewage districts, Water policy, Water users.

The purpose of the study was to investigate and determine what problems exist in the administration of West Virginia water laws and regulations as perceived by those involved as consumers of water resources and by those involved in the processes of delivering and regulating water services. Conclusions reached are that many persons having water-resource problems feel they receive inadequate assistance from available attorneys, building and road contractors do not feel hampered by problems in water law, diversion of surface (sheet) runoff in residential areas is not handled adequately by the 'common law' or 'common enemy' rule, normal difficulty in attaching responsibility for water and siltation damage caused by major construction performed by a private party or by the state is made much more difficult if both the state as owner and a private party as contractor are involved, law guiding the right of local sanitary districts to deny service to new customers and to terminate existing but unauthorized customer use is uncertain and confusing, and the statutory scheme of the Water Resources Board and the form and procedure of its practice are in need of change that should include movement toward a full-time professional board and other major changes.

WATER SHORTAGES IN THE SOUTHEAST,
North Carolina Water Resources Research Inst., Raleigh.
D. H. Howells.
In: Proceedings of the Conference on Water Conservation Needs and Implementing Strategies, July 9-13, Franklin Pierce College, Rindge, NH, p 147-155, 1979. 2 Ref. OWRT-B-123-NC-(8)-B-125-NC-(7).

Descriptors: *Water conservation, *Water shortage, *Southeast U. S., Humid areas, Wet climates, Water allocation(Policy), Equitable apportionment, Riparian rights, Water law, Water sources, Planning, Saline water intrusion, Urbanization, Recharge, Groundwater.

Although the Southeast is in general a humid region with abundant precipitation, perennial water shortages are of increasing concern. These shortages are caused by disparities between timing and location of supply and demand and individual system deficiencies. These problems are expected to increase due to population growth, industrial production, and agricultural irrigation. Some States in the area are considering switching from the riparian to the prior appropriation doctrine as a means of water allocation. Legislation in Mississippi, North Carolina, South Carolina, and Virginia has made provisions for the allocation of groundwater. Florida has taken the most far-reaching allocation steps with administrative regulation of surface and groundwater withdrawals. To ultimately balance water supplies and demand, transriparian and interbasin transfer will be needed. More study is needed in areas such as minimum streamflows, drought and emergency allocations, preservation of needed reservoir sites, protection of groundwater recharge areas, saline water intrusion, and other pollution and protection concerns. New mechanisms for interstate cooperation during times of water shortage are also needed. A comprehensive system involving State and regional water resources planning and management is needed to provide an overview and areawide perspective of how to best use available water supplies. DROUGHT EFFECTS ON METROPOLITAN WASHINGTON, D.C. AREA,
Corps of Engineers, Baltimore, MD.
J. E. Crews, and W. E. Trieschman.
In: Proceedings of the Conference on Water Conservation Needs and Implementing Strategies, July 9-13, 1979, Franklin Pierce College, Rindge, NH, p 156-164, 1979. 2 Fig, 1 Tab, 12 Ref.

Descriptors: *Washington(DC), *Water allocation(Policy), *Potomac River, Droughts, Low flow, Water shortage, Urbanization, Virginia, River flow, Water conservation, Planning, Water supply, Utilities, Water works, Suburban areas.

The Metropolitan Washington Area (MWA) depends on the Potomac River for most of its water supply. The river is unregulated and flows fluctuate widely with an average of 6,000 million gallons per day. This average is more than enough to meet current and future demands, however, during periods of drought this average drops sharply and steps are being taken to assure equitable allocation during such times. In the 1970's, two adjoining areas were given permission to tap the Potomac, the Washington Suburban Sanitary Commission (WSSC) and the Fairfax County Water Authority (FCWA). Recognizing that a critical situation could develop during times of low-flow, the utilities for MWA, WSSC, and FCWA signed a Low Flow Allocation Agreement in January 1978. Under the agreement all utilities could share the available water according to a predetermined formula. This agreement provides for fair allocation of existing water but it will not eliminate shortages. Each of the utilities has therefore set up water shortage emergency plans. Also, the Corps of Engineers is conducting a water supply study for the most efficient use of existing supplies before new water sources are developed. Four plans have been formulated for the future, all of which include a water conservation program. (See also W81-00160) (Seigler-IPA)

MEDITERRANEAN STATES AGREE ON TREATY TO CONTROL LAND-BASED POLLUTION,
I. Guest.
Ambio, Vol 9, No 3-4, p 194-195, 1980.

Descriptors: *Mediterranean Sea, *Water pollution sources, *Water pollution control, *International commissions, Regulation, Water pollution, Rivers, DDT, Pesticides, Heavy metals, Industrial wastes, Sewage, Toxins, Costs, Legislation, Oceans.

A treaty was proposed by fifteen of the states bordering the Mediterranean Sea and by the European Economic Community to control land-based sources of pollution in the sea. It is estimated that 85% of the pollution in the Mediterranean Sea comes from the land, most of it carried by rivers. An estimated 90 tons of DDT and other pesticides flow into the sea yearly, as well as tons of heavy metals, industrial wastes, and untreated sewage. Cleaning up the sea will cost $10-15 yr. The agreement established a list of toxic substances so dangerous that their emissions are banned altogether (e.g. mercury, cadmium, radioactive substances and lubricating oils) and a list of 20 substances which will be allowed in strictly controlled quantities (e.g. lead, silver, tin). Limits of tolerance must be established by the cooperating states. Now that the various governments have recognized their common problem, the scientific community will have to resolve differences of opinion as to what constitutes pollution. Problems remaining include argument over the site of the program secretariat and enforcement of the agreement. (Baker-FRC)

THE INTERNATIONAL DRINKING WATER SUPPLY AND SANITATION DECADE PREPARES FOR LAUNCHING,
World Health Organization, Geneva (Switzerland). Div. of Environmental Health.
G. Schultzberg.
Ambio, Vol 9, No 3-4, p 201-202, 1980. 1 Fig.

Descriptors: *Potable water, *United Nations, *Water resources development, *Public health, Water supply, Environmental sanitation, International commissions, Attitudes, Administrative agencies, Projects, Programs.

Plans are discussed for the International Drinking Water Supply and Sanitation Decade (beginning

November 1980) supported by the Economic and Social Council of the United Nations. The goal of the program is to adopt programs with realistic standards of quality and quantity of water supplies for both rural and urban areas of the world by 1990. A rapid assessment exercise by Member States revealed that few countries have taken steps to put the goal into action. However, the fact that over 100 countries are participating in the assessment phase is seen as encouraging. Completion of the goal may be slowed by a lack of manpower to prepare plans and programs. The success of the Decade will depend on the initiative of each country and its willingness to act. Changes will be needed both in attitudes and in approaches to sanitation and health care in developing countries and among multilateral and bilateral agencies involved. (Baker-FRC)

WATER POLLUTION ABATEMENT PROBLEMS AROUND LIVESTOCK,
Nebraska Univ.,-Lincoln.
C. B. Gilberston.
Agricultural Engineering, Vol 61, No 8, p 24-25, August, 1980. 1 Fig.

Descriptors: *Agricultural runoff, *Water pollution control, *Feed lots, *Permits, *Administrative agencies, Legislation, Environmental Protection Agency, Fishkill, Water pollution, Farm wastes, Regulation, Clean Water Act, Drainage water, Environmental sanitation, State jurisdiction.

Government regulations concerning feed-lot pollution are discussed. Feed lots were identified as sources of water pollution in the 1960s, when fishkills were thought to be due to uncontrolled runoff. Water pollution control laws banning discharge of feed-lot runoff into public streams, lakes or ponds were passed in several states in the 1970s. It was planned at that time that by 1983 all public waters would be safe for fishing, boating and swimming. Permits issued by EPA through the National Pollutant Discharge Elimination System (NPDES) are required for specific capacity feed lots, for situations in which a stream runs through a 300-1,000 head lot, or for any operation which significantly pollutes a body of water. Permit requests are made to a State Water Control Agency or the EPA, after which a preliminary permit is made available for review by the livestock operator, the interested state agency, and the public. Permits are valid for 5 yr. Effluent limits stated in the permit are site-specific and comply with NPDES guidelines. Effluent guidelines have, however, been difficult to interpret. Specific management techniques which help reduce pollution include better shaping of feed lots to improve drainage, maintenance of watering equipment, and good sanitation practices. (Baker-FRC)

WATER, WATER EVERYWHERE, BUT LESS OF IT TO DRINK,
K. J. /Scott
Ambio, Vol 9, No 3-4, p 200-201, 1980.

Descriptors: *Clean Water Act, *Potable water, *Water purification, *Industrial water, *Municipal water, Legislation, Water quality, Industrial wastes, Costs, Industrial plants, Water pollution, Public health, Toxins, Water pollution control.

The article briefly reviews the problems encountered over the past several years in efforts to maintain satisfactory quality control for drinking water supplies in the United States. Cost is one of the major factors which makes the program difficult to accomplish. In view of deteriorating quality of water supplies, the Congress passed the Clean Water Act in 1972. This required industrial plants to obtain discharge permits, and provided federal aid for the construction of municipal sewage treatment plants. 1985 was set as the target date by which industrial users were to return water to the source as clean as it was when they removed it. Progress in following the requirements of this act has been mixed. Not only are there problems in the original pollution to be removed, there are now problems created by the by-products of water purification programs. Each new crisis has lead to the restructuring of rules to meet it. However, with each new regulation imposed, arguments are presented by companies complaining that compliance would drive them out of business, or by municipalities claiming that some of these precautions are not necessary for them. 6G. Ecologic Impact Of Water Development

GUIDELINES FOR INTEGRATING GEOLOGICAL AND ARCHAEOLOGICAL INFORMATION INTO WATER RESOURCE PROJECT ENVIRONMENTAL ANALYSIS,
Arizona Univ., Tucson. Dept. of Hydrology and Water Resources.
M. Bradley, and D. A. Altshul.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-114019, Price codes: A03 in paper copy, A01 in microfiche. Completion Report, September 1980. 37 p, 13 Ref, 3 Append. OWRT-A-088-ARIZ (2), 14-34-001-8003, 14-34-001-9003.

Descriptors: *Water resources development, *Legal aspects, *Geology, *Archaeology, *Standards, Water resources, Environmental effects, Environmental control, Legislation, Wild River Act, Documentation, Information exchange, Reviews, National Historic sites, State governments, State jurisdiction.

The purpose of this paper was to introduce techniques and develop guidelines for use by public officials conducting interdisciplinary environmental studies, and for integrating this data into environmental impact reports. The general guidelines developed serve as the method for project planners/administrators in conducting cultural resource analysis on Federally funded water projects. The guidelines follow three steps: (1) initial contact with the appropriate State Historic Preservation Officer (SHPO); (2) review of detailed information from private consultants and the SHPO and development and incorporation of recommendations into the text of a prepared report; and (3) the conduct of certain secondary investigative procedures by research staff/consultants for the lead agency. Use of the guidelines in large and small scale analyses was demonstrated. Appendices cover a synopsis of legal authorities and lists of cultural resource institutions (including SHPO's) and museums/historical societies. Authority for archaelogical/historical impact analysis was considered in detail, such as the National Environmental Policy Act of 1969, requiring Federal agencies to conduct environmental impact analyses on actions significantly affecting human environmental quality. 'Significance' is elaborated under categories of historical, scientific research, ethnic, and public significance, for the purposes of this report. (Zielinski-IPA)

RESEARCH PRIORITIES IN TROPICAL BIOLOGY,
National Research Council, Washington, DC. Assembly of Life Sciences.
J. J. Talbot.
Environmental Conservation, Vol 7, No 2, p 99-100, Summer, 1980. 1 Ref.

Descriptors: *Tropical regions, *Research priorities, *Land use, *Ecology, Rain forests, Wet climates, Water resources, Rivers, Lakes, Watershed management, Water chemistry, Aquatic life, Urbanization, Africa, Asia, South America.

The international Committee on Research Priorities in Tropical Biology was established to devise ways of increasing the pace of basic research, concentrating on promising scientific and geographic areas. It functioned between March 1978 and March 1980 but may now be disbanded. The committee used the following criteria when choosing research topics: urgency due to imminent change in an ecological or biological system, and potential significance to biology and its supporting disciplines. The Committee recommended that the pace of biological inventory be increased in tropical regions in the next two decades. Tropical ecosystem studies, including water and nutrient cycling investigations, were urged for various forest areas. Studies of major rivers, lakes, streams, and wetlands of the tropics are of scientific importance, especially as changes such as watershed deforestation, impoundment for energy production and flood control, and urban and industrial pollution will occur in these areas. Particular areas to study include the Amazon, Orinoco, and Zaire rivers, as well as the Musi (Sumatra) and Purari (New Guinea), Lakes Valencia and Maracaibo (Venezuela), Malawi, Titicata, and volcanic lakes in southeast Asia, and wetlands like the Sudd and Benguelu in Africa, the varzea of the Amazon and Orinoco basins, and the peat swamps in southeast Asia. Water chemistry and nutrient processing, plankton, fishes, bottom fauna, certain vertebrates, and land-water interactions should be studied in these areas. (Gish-FRC)

FREQUENCY OF AGRICULTURAL AND FOREST DROUGHT IN NEW HAMPSHIRE: 1926 - 1975,
Northeastern Forest Experiment Station, Durham, NH.
C. A. Federer.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-111254, Price codes: A03 in paper copy, A01 in microfiche Research Report No 26, 1980. 37 p, 8 Fig, 1 Tab, 16 Ref, 3 Append. Water Resource Research Center, University of New Hampshire, Durham. OWRT-A-999-NH (6).

Descriptors: *Drought, *Agriculture, *Forest drought, *Soil water, New Hampshire, Soil moisture, Moisture deficit, *Soil water deficits, Agricultural drought, Water deficits.

Agricultural drought is defined as a shortage of soil water for plant growth. It can be quantified in terms of soil-water deficits during the growing season. A hydrologic simulation model called BROOK was used to estimate daily soil-water deficits from daily precipitation and mean temperature for 50 years (1926-1975) at three New Hampshire locations: Berlin, Durham, and Keene. In the simulated soil, which had about 120 mm of available water, deficits greater than 60 mm may indicate occurrence of agricultural drought. This deficit is exceeded about half the time between mid-July and mid-September at all locations. Both the number of days with deficits larger than 60 mm and the mean deficit from June through August are satisfactory measures of dryness of different summers. In most

years dryness at one location was not related to dryness at the other locations, indicating that agricultural drought in New Hampshire is a local rather than a regional phenomenon. Graphs provide data on the frequency of a drought of a given length, timing, and intensity. For example, on August 1 a run of deficits exceeding 75 mm for 30 days occurred in about 15% of the years at Keene and Durham and in 7% of the years at Berlin. Soil water was always recharged before late December, so agricultural drought did not carry over from one summer to the next. Estimates of soil-water deficits are much more satisfactory than precipitation for studying the relation of drought occurrence to plant growth.

WATERSHED INFORMATION SYSTEM,
Colorado State Univ., Fort Collins. Dept. of Earth Resources.
A. G. Thomsen.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-115701, Price codes: A09 in paper copy, A01 in microfiche. Ph.D. Dissertation, Spring 1980. 161p. OWRT-B-160-COLO(3), 5-31640.

Descriptors: Snow, *Snowmelt, Hydrologic models, *Remote sensing, *Model studies, *Streamflow, Satellites(Artificial), Aerial photography, Computer program, Watersheds(Basins), Water equivalent, Topography, Vegetation, Soils, Colorado, Rocky Mountain Region, Mountain watersheds.

A watershed information system for the analysis and simulation of mountain watersheds is described. Watershed information on topography, vegetation and soils in digital terrain models (overlays) serve as the data base for watershed analysis, classification of snow in Landsat imagery and automatic generation of parameter decks for operating distributed simulation models of snowcover dynamics and streamflow generation. The computer programs that generate the parameter decks have built-in calibration options for all major processes, that permit fast model calibration from an interactive computer terminal, on watersheds with varying characteristics. Snow processes are simulated within square (5.76 ha) grid-cell elements. The hydrograph resulting from spring snowmelt is simulated by a lateral flow model of streamflow generation driven by the simulated spatially distributed input (snowmelt and rain). Options are available for simulating the effects of forest management alternatives (thinning, clearcutting) on selected forest stands. Line printer generated map overlays showing simulated snowcover parameters (depth, temperature) as well as the moisture content of the rooting zone, can be produced for any date between April 1 and July 31.

EVALUATION OF MEMBRANE FILTER METHODS FOR ENUMERATION OF FAECAL COLIFORMS FROM MARINE WATER,
Massachusetts Univ., Waltham. Dept. of Environmental Sciences.
B. L. Green, W. Litsky, and K. J. Sladek.
Marine Environmental Research, Vol 3, No 4, p 267-276, September, 1980. 3 Fig, 3 Tab, 14 Ref.

Descriptors: *Membrane processes, *Filters, *Coliforms, *Sea water, Incubation, Temperature, Water sampling, Sewage bacteria, Analytical techniques, Coasts, Sewage disposal, Laboratory tests.

A 24-hr modified membrane filter technique suitable for the enumeration of fecal coliforms from chlorinated sewage effluents employs m-FC agar with a preincubation temperature of 35C for 5 hr followed by 44.5C for 18 plus or minus 1 hr. The technique was compared with the standard membrane filter process with an incubation temperature of 44.5C and the most probable number (MPN) technique for estuarine and marine environments. The study used 9 laboratory and 72 plant chlorinated primary and secondary sewage samples. Comparison of the results of the techniques demonstrated that the modified membrane filter counts were higher than the standard membrane filter technique in 64 of 68 trials, with the modified method yielding an average of 50% higher counts than the standard membrane filter method. While both membrane filter methods had correlation coefficients of 0.95 compared with the MPN, only 75% of the standard membrane filter samples were within the 95% confidence limits of the MPN, whereas 90% of the counts obtained with the modified method fell within 95% confidence limits. APPLICATIONS OF GEOPHYSICS IN GROUNDWATER INVESTIGATIONS,
Birmingham Univ. (England).
R. D. Barker.
Water Services, Vol 84, No 1014, p 489-492, 480, August, 1980. 9 Fig, 4 Ref.

Descriptors: *Groundwater, *Subsurface mapping, *Hydrogeology, *Instrumentation, Borehole geophysics, Geophysics, Aquifers, Saline water, Valleys, Resistivity, Gravimetry, Seismographs.

The use of geophysical techniques in investigating the condition of groundwaters is described. The electrical resistivity technique has particular advantages in hydrogeology in that it responds to variations in conductivity of the groundwater. This technique allows the land itself to remain undamaged. The gravity method is usually employed for reconnaissance purposes, particularly for locating faulted and other structural boundaries and for mapping of alluvium filled valleys. The seismic technique may be used to determine the depth to the base of alluvium. Induced polarization is used in hydrogeological surveys to distinguish between pure sands of high permeability and sands with disseminated clays of lower permeability. Four case histories are presented, three of which discuss the use of the resistivity technique. One case discusses the mapping of an aquifer structure. The second case describes the use of geophysical surveys to site a single borehole accurately. The third problem called for identification of the extent of the saline groundwater in a particular area and study of the subdrift geology and positions of major faults. The fourth case involves investigation of a buried drift-filled valley in Essex, England. (Baker-FRC)

PORTABLE INSTRUMENTATION TO MONITOR FLOW RATE AND VOLUME,
Georgia Univ., Athens.
R. Harrell, J. M. Allison, B. D. McLendon, and M. Lawrence.
Agricultural Engineering, Vol 61 No 5, p 12-13, May, 1980. 1 Fig.

Descriptors: *Flowmeters, *Monitoring, *Flow measurement, *On site data collection, Flow, Flow rates, Spraying, Volume, Velocity, Water measurement.

A description is given of a portable instrument designed to monitor flow rate and volume. The combination of display multiplexing and Complementary Metal Oxide Semiconductor (CMOS) Integrated Circuits makes battery operation of the circuit feasible, so that the system is portable. The display can be turned off and on without interrupting count operations, thus extending battery life. A panel switch makes it possible to reset the accumulator to zero. The device may be used in water flow systems, but could be equally well applied to measure air speed, revolutions per minute, ground speed, and other variables. It might also prove useful in measuring from sprayer applications where both flow rate and total volume are of interest. (Baker-FRC)

Geological Survey, *Outer Continental shelf, National Petroleum Reserve in Alaska, *Federal reservations, Indian reservations.

This circular describes the 1980 programs of the U.S. Geological Survey in Alaska. A brief description of the Alaskan operations of each major division of the Survey is followed by project descriptions arranged by geographic regions in which the work takes place. The mission of the Geological Survey is to identify the Nation's land, water, energy, and mineral resources; to classify federally-owned mineral lands and waterpower sites; to resolve the exploration and development of energy and natural resources on Federal and Indian lands; and to explore and appraise the petroleum potential of the National Petroleum Reserve in Alaska. Alaska is at once the largest, the least populated, the least explored, and the least developed State in the Nation. More than half of the Nation's 600 million acres of Outer Continental Shelf lies off Alaska's coast. The land area of Alaska contains 375 million acres, 16 percent of the onshore land of the Nation. Its resources of all kinds present an opportunity to demonstrate how the needs of both conservation and development can be met for the benefit of the American people. (USGS)

WATER RESOURCES DATA FOR PENNSYLVANIA, WATER YEAR 1979--VOLUME 3, OHIO RIVER AND ST. LAWRENCE RIVER BASINS,
Geological Survey, Harrisburg, PA. Water Resources Div.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-223951, Price codes: A17 in paper copy, A01 in microfiche.
Geological Survey Water-Data Report PA-79-3, June 1980. 386 p, 7 Fig.

Descriptors: *Pennsylvania, *Hydrologic data, *Surface waters, *Groundwater, *Water quality, Gaging stations, Streamflow, Flow rates, Sediment transport, Water analysis, Water temperature, Chemical analysis, Lakes, Reservoirs, Water wells, Water levels, Data collections, Sites, *Ohio River basin(PA), St. Lawrence River basin(PA).

Water resources data for the 1979 water year for Pennsylvania consist of records of discharge and water quality of streams; contents of lakes and reservoirs; and water levels and water quality of ground-water wells. This volume contains records for water discharge at 86 gaging stations, contents at 22 lakes and reservoirs, water quality at 28 gaging stations and 11 wells, and water levels at 23 observation wells. Also included are data for 11 crest-stage, 28 low-flow, and 312 water-quality partial-record stations. Additional water data were collected at various sites not involved in the systematic data-collection program and are published as miscellaneous measurements and analyses. These data together with the data in volumes 1 and 2 represent that part of the National Water Data System operated by the U.S. Geological Survey and cooperating State, local, and Federal agencies in Pennsylvania. Geological Survey Water-Data Report IL-79-2, May 1980. 401 p, 4 Fig.

Descriptors: *Illinois, *Hydrologic data, *Surface waters, *Groundwater, *Water quality, Gaging stations, Streamflow, Flow rates, Sediment transport, Water analysis, Water temperature, Chemical analysis, Lakes, Reservoirs, Water wells, Water levels, Data collections, Sites, *Illinois River basin

Water resources data for the 1979 water year for Illinois consist of records of stage, discharge, and water quality of streams; stage and contents of lakes and reservoirs; and water levels and water quality of ground-water wells. This volume contains records for water discharge at 85 gaging stations, stage only at 2 gaging stations, stage only at 3 lake stations, water quality at 92 gaging stations and 25 wells, and water levels at 3 observation wells. Also included are data for 96 crest-stage partial-record stations and 42 flood-profile stations. Additional water data were collected at various sites not involved in the systematic data-collection program and are published as miscellaneous measurements and analyses. These data together with the data in volume 1 represent that part of the National Water Data System operated by the U.S. Geological Survey and cooperating State, local, and Federal agencies in Illinois. AN ECOLOGICAL CHARACTERIZATION OF THE PACIFIC NORTHWEST COASTAL REGION. VOLUME 1. CONCEPTUAL MODEL,
Ryckman, Edgerley, Tomlinson and Associates, Inc., Bellevue, WA.
C. M. Proctor, J. C. Garcia, D. V. Galvin, T. Joyner, and G. C. Lewis.
Department of the Interior Fish and Wildlife Service Publication FWS/OBS-79/11, July 1980. 224 p, 96 Fig, 22 Tab, 186 Ref. 14-16-0009-77-019.

Descriptors: *Computer models, *Ecological distribution, *Environment, *Habitats, *Coasts, Data collections, Information exchange, Computer simulation, Data processing, Mathematical models, Programs(Computer), Simulation analysis, Model studies, Experimental models, Statistical models, Ecology, Ecosystems, Distribution, Balances of nature, Environmental gradient, Microenvironment, Basic data collections, *Pacific Northwest U.S.

A conceptual model was developed as the approach to ecological characterization of the Pacific Northwest Coastal Region, and used as a framework for collection, organization, and synthesis of data for the Characterization Atlas (Volumes 2-4). Model development was an iterative process, ranging from a 1977 Pilot Study Report and monthly Reports, to drafts of the Conceptual Model. Earlier drafts were used in preparing parts of the Test Characterization (Pilot Study), and the Model was modified following application to data collection to adjust for conceptual deficiencies. It was retested in characterization, with process reiteration, to yield the resultant Conceptual Model. This Model and the ecological models and submodels within it proved to be an integral framework for preparing the Characterization Atlas starting in Volume 2. It was concluded that the model approach for providing a conceptual framework for preparation and evaluation of ecological characterization studies represented a valid concept. Future work should involve further model modification/refinement as experience in application to natural systems is gained; and integration of the conceptual approach with mathematical modeling. Ecological modeling (Part 1) included specific considerations of the physiochemical, biological, and socioeconomic environments. Parts 2 and 3 respectively, considered specific zones/habitats and provided reference data. (Zielinski-IPA)

AN ECOLOGICAL CHARACTERIZATION OF THE PACIFIC NORTHWEST COASTAL REGION. VOLUME 2. CHARACTERIZATION--ATLAS REGIONAL SYNOPSIS,
Ryckman, Edgerley, Tomlinson and Associates, Inc., Bellevue, WA.
C. M. Proctor, J. C. Garcia, D. V. Galvin, G. C. Lewis, and L. C. Loehr.
Department of the Interior Fish and Wildlife Service Publication FWS/OBS-79/12, July 1980. 570 p, 165 Fig, 194 Tab, 820 Ref. 14-16-0009-77-019.

Descriptors: Data collections, Information exchange, *Computer models, *Ecological distribution, *Habitats, *Environment, *Coasts, Computer simulation, Data processing, Mathematical models, Programs(Computer), Simulation analysis, Model studies, Experimental models, Statistical models, Ecology, Ecosystems, Distribution, Balance of nature, Environmental gradient, Microenvironment, Basic data collections, *Pacific Northwest U.S.

Following completion of the Pilot Study reported in 1977, it became evident that use of a reporting structure, in which the Conceptual Model (Vol. 1) was to contain considerable regional data plus zone/habitat descriptions and habitat-specific models, was unsatisfactory for two reasons: (1) the physical bulk of material for the Conceptual Model was prohibitive; (2) more importantly, much material in the 1977 Conceptual Model really belonged in this Characterization Atlas. Thus, the reports structure was changed to that described in this Volume. This Regional Synopsis of the Characterization Atlas (Volume 2) contains a users' guide to access the characterizational information, and is comprised of three principal parts. Part I compiles regional characterizational information, covering the detailed features of the physical, biological, and socioeconomic environments of the coastal ecosystem. Part II reports on species of concern for twenty types of vegetative and land-based and marine animal species; while Part III contains reference data on symbols and terms. Volumes 3 and 4 of this ecological characterization deal with zone and habitat, and watershed descriptions, respectively; Volume 5 represents the data source appendix, containing data tapes and printouts. W81-00141

SEASONAL AND ANNUAL VARIATIONS IN THE POTENTIOMETRIC SURFACE OF THE FLORIDAN AQUIFER IN DUVAL COUNTY, FLORIDA, 1960-77,
Geological Survey, Tallahassee, FL. Water Resources Div.
G. W. Leve.
ogical Survey Open-File Report 80-164 (WRI), 1980. 1 Sheet, 4 Fig, 2 Ref.

Descriptors: *Maps, *Aquifers, *Water levels, *Potentiometric level, *Florida, Groundwater, Water utilization, Water wells, Water level fluctuations, *Floridan aquifer, *Duval County(FL), *Jacksonville(FL).

Potentiometric levels of the Floridan aquifer in Duval County, Fla., are constantly changing in response to gains of water to the aquifer, primarily by recharge from rainfall; and losses from the aquifer, primarily by withdrawals from hundreds of wells. Seasonal variations of the potentiometric level in one well at Jacksonville was 4.2 feet during 1976. During the 18 year period from 1960 to 1977 the mean annual decline of potentiometric levels in the county was about 8 feet because of a large increase in withdrawals and to a lesser extent a decline in average annual rainfall in recharge areas. Maps of the potentiometric surface in 1960 and 1977 indicate that the greatest decline was more than 20 feet in the south-central part of the county. The decline was less than 5 feet in the western part of the county. (Kosco-USGS)

GROUND WATER IN OSCEOLA COUNTY, FLORIDA,
Geological Survey, Tallahassee, FL. Water Resources Div.
J. M. Frazee, Jr.
Available from OFSS, USGS, Box 25425, Fed. Ctr., Denver, CO. 80225, paper copy $3.50, microfiche $0.50. Geoological Survey Open-File Report 79-1595 (WRI), 1980. 1 Sheet, 6 Fig, 11 Ref.

Descriptors: *Maps, *Groundwater, *Aquifers, *Water quality, *Florida, Aquifer characteristics, Natural recharge, Potentiometric level, Water wells, Water levels, Water supply, Geologic formations, Hydrogeology, Hydrographs, *Osceola County(FL), *Floridan aquifer.

This report describes the ground-water resources of Osceola County, Florida, with emphasis on the (1) location of the principal aquifers, (2) location of areas of ground-water recharge and discharge, (3) chemical quality of ground water, and (4) quantities of ground water available. The investigation includes an inventory of 365 wells, test drilling in unconsolidated materials overlying the Floridan aquifer, water-level measurements, and water quality sampling and analysis. (USGS)
W81-00143

CONFIGURATION OF THE TOP OF THE HIGHLY PERMEABLE DOLOMITE ZONE OF THE FLORIDAN AQUIFER, SOUTHWEST FLORIDA WATER MANAGEMENT DISTRICT,
Geological Survey, Tallahassee, FL. Water Resources Div.
R. M. Wolansky, G. L. Barr, and R. M. Spechler.
Available from OFSS, USGS, Box 25425, Fed. Ctr., Denver, CO. 80225, paper copy $1.75, microfiche $0.50. Geological Survey Open-File Report 80-433 (WRI), 1980. 1 Sheet, 24 Ref.

Descriptors: *Maps, *Aquifers, *Permeability, *Florida, Aquifer characteristics, Rock properties, Hydrogeology, Geohydrologic units, *Floridan aquifer, *Southwest Florida Water Management.

This map report presents the configuration of the top of the highly permeable dolomite zone of the Floridan aquifer in the Southwest Florida Water Management District. The top of the highly permeable dolomite generally corresponds to the top of a thick bed of massive, hard, dark brown dolomite occurring in the Avon Park Limestone of Eocene age. The altitude of the top of the permeable dolomite varies from about 100 feet below the National Geodetic Vertical Datum of 1929 in the north to about 1,600 feet below the datum in the south. (Kosco-USGS)

WATER RESOURCES DATA FOR OHIO, WATER YEAR 1979--VOLUME 1. OHIO RIVER BASIN,
Geological Survey, Columbus, OH. Water Resources Div.
Geological Survey Water-Data Report OH-79-1, July 1980. 487 p, 2 Fig.

Descriptors: *Ohio, *Hydrlogic data, *Surface waters, *Groundwater, *Water quality, Gaging stations, Streamflow, Flow rates, Sediment transport, Water analysis, Water temperature, Chemical analysis, Lakes, Reservoirs, Water wells, Water levels, Data collections, Sites, *Ohio River basin(OH).

Water resources data for the 1979 water year for Ohio consist of records of stage, discharge, and water quality of streams; stage, contents, and water quality of lakes and reservoirs; and water levels and water quality of ground-water wells. This report in three volumes contains records for water discharge at 197 gaging stations, stage and contents at 32 lakes and reservoirs, water quality at 54 gaging stations and 49 wells, and water levels at 157 observation wells. Also included are data for 58 crest-stage partial-record stations, 26 low-flow partial-record stations, and 311 coal hydrology synoptic sites. Additional water data were collected at various sites not involved in the systematic data-collection program and are published as miscellaneous measurements and analyses. These data represent that part of the National Water Data System collected by the U.S. Geological Survey and cooperating State and Federal agencies in Ohio. (USGS)

WATER RESOURCES DATA FOR HAWAII AND OTHER PACIFIC AREAS, WATER YEAR 1979--VOLUME 1. HAWAII,
Geological Survey, Honolulu, HI. Water Resources Div.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-115065, Price codes: A14 in paper copy, A01 in microfiche. Geological Survey Water-Data Report HI-79-1, June 1980. 296 p, 15 Fig, 1 Tab.

Descriptors: *Hawaii, *Hydrologic data, *Surface waters, *Groundwater, *Water quality, Gaging

stations, Streamflow, Flow rates, Sediment transport, Water analysis, Water temperature, Chemical analysis, Lakes, Reservoirs, Water wells, Water levels, Data collections, Sites.

Volume 1 of water resources data for the 1979 water year for Hawaii and other Pacific areas consist of records of stage, discharge, and water quality of streams; and water levels and water quality in wells and springs. This report contains discharge records for 111 gaging stations; water quality for 12 gaging stations, 103 partial-record flow stations, and 157 wells; and water levels for 22 observation wells. Also included are 106 crest-stage partial-record stations and 18 low-flow partial-record stations. Additional water data were collected at various sites, not part of the systematic data collection program, and are published as miscellaneous measurements. These data represent that part of the National Water Data System operated by the U.S. Geological Survey and cooperating State, Federal, and other agencies in Hawaii. (USGS)

MAPS SHOWING GROUND-WATER CONDITIONS IN THE DOUGLAS BASIN AREA, COCHISE COUNTY, ARIZONA--1978,
Geological Survey, Tucson, Az. Water Resurces Div.
L. J. Mann, and C. S. English.
OFSS, USGS, Box 25425, Fed. Ctr., Denver, CO 80225, paper copy $10.75, microfiche $1.50. Geological Survey Open-File Report 80-700 (WRI), May 1980. 3 Sheets, 11 Ref.

Descriptors: *MAPS, :GROUNDWATER, :Irrigation, *Water level fluctuations, *Water quality, Aquifer characteristics, Water wells, Withdrawal, Pumping, Drawdown, Land use , Hydrographs, Arizona, *Douglas basin area(AZ), *Cochise County(AZ).

The Douglas basin area includes about 1,200 square miles in southeastern Arizona. The main use of ground water is for irrigation. For 1955-77, the estimated ground-water pumpage equaled or exceeded 50,000 acre-feet per year, and for 1966-77, the ground-water pumpage averaged about 109,000 acre-feet per year. Ground-water withdrawals have resulted in water-level declines in most of the area. Information shown on the maps includes change in water level (1966-78) and irrigated area; depth to water and altitude of the water level; and chemical quality of the water and well depth. Hydrographs of the water level in selected wells and a table of historical pumpage also are included Scale 1:125,000. (USGS)
W81-00155

MAPS SHOWING GROUND-WATER CONDITIONS IN THE UPPER VERDE RIVER AREA, YAVAPAI AND COCONINO COUNTIES, ARIZONA--1978,
Geological Survey, Tucson, Az. Water Resources Div.
G. W. Levings, and L. J. Mann
Available from OFSS, USGS, Box 25425, Fed. Ctr., Denver, CO 80225, paper copy $9.50, microfiche $1.00. Geological Survey Open-File Report 80-726 (WRI), April 1980. 2 Sheets, 10 Ref.

Descriptors: *Maps, *Groundwater, *Aquifer characteristics, *Water table, *Water quality, Hydrogeology, Water supply, Water utilization, Water yield, Irrigation, Water wells, Water analysis, Fluorides, *Upper Verde River area(AZ), *Yavapai County(Az), Coconino County(AZ).

The upper Verde River area includes about 3,600 square miles in north-central Arizona. The area is underlain by a regional aquifer that consists of several formations. In places ground water also is present in the igneous rocks and basalt flows and in the alluvium along the channels and flood plains of the streams. Ground-water development has been slight; in 1978 about 8,000 acre-feet of ground water was withdrawn for domestic, public-supply, industrial, and irrigation uses. Information on the maps includes the principal geologic formation that furnishes water to wells and springs, depth to water, altitude of the water level, and chemical quality of the water. Scale 1:125,000. (USGS)

HYDRAULIC DESIGN OF BRIDGES WITH RISK ANALYSIS,
Geological Survey, NSTL Station, MS. Water Resources Div.
V. R. Schneider, and K. V. Wilson.
Federal Highway Administration report, FHWA-TS-80-226, March 1980. 138 p, 7 Fig, 3 Tab, 22 Ref, 2 Append. P O 5-3-0194.

Descriptors: *Hydraulic design, *Bridges, *Risks, *Analytical techniques, *Economic life, Design flood, Flood plains, Highway effects, Backwater, Flow profiles, Open channel flow, Channel morphology, Construction, Costs, Project planning, Design data, *Risk analysis.

This manual presents example studies and reports which implement the philosophy that the total stream crossing including the approach fills in the flood plains and all necessary waterway openings should be designed and constructed for the least total expected cost to the public. The total expected cost includes the capital investment in the highway, expected replacement and repair costs as a result of flood damages, expected user costs from traffic interruption and detour, and expected backwater drainages during the service life of the highway. Techniques for making engineering and economic studies for the least cost designs are presented along with suggestions for managing the time and work required for such studies. A unique design flood is defined for each bridge as the flood whose upstream stage is equal to the lowest elevation of the approach fill or bridge deck. Two example reports were prepared to illustrate the application of the method to a rural site (low backwater damage) and an urban site (high potential traffic interruption and backwater damage). OXFORD CITY GETS NEW TRUNK OUTFALL SEWER. WEDGE BLOCK TUNNEL SAVES CHRISTCHURCH MEADOWS AND 3 MILLION POUNDS,
Water Services, Vol 84, No 1014, p 507-508, 511-512, August, 1980. 3 Fig.

Descriptors: *Outfall sewers, *Tunnels, *Pumping plants, *Municipal wastes, *Sewerage, Sewers, Geological surveys, Underground structures, Costs, Social aspects, Water yield

Use of a wedge-block lining technique to upgrade an overloaded sewer system for the City of Oxford, England, is described. The block tunnel was designed to replace the existing outfall sewer with a new low-level pumping station to lift the flow about 12 m from the tunnel outfall to the level of the existing inlet to the pretreatment plant. When this was completed, the plan called for a detailed survey of the existing brick-ring trunk sewer to determine whether it should be repaired or filled in. It was estimated that use of the wedge-block lining technique in this particular problem area allowed the savings of large amounts of money by the City. (Baker-FRC)

COMPUTER-BASED TELECONTROL FOR BROMLEY GROUP,
Water Services, Vol 84, No 1014, p 495-496, August, 1980. 2 Fig.

Descriptors: *Pumping plants, *Control systems, *Computers, *Monitoring, *Instrumentation, Computer programs, Pumping, Pressure measuring instruments, Flow measurement, Flow rates, Distribution systems, Pipelines, Water conveyance, Reservoir storage.

Updating of the Bromley Area Water Pumping Scheme in England was conducted over a 4-year period. More modern equipment was added to older pumping stations and a control center was established at the Orpington station to house the new maintenance center that will service the Kent area. A large instrumentation console was built at the Shortlands station to monitor valve positions, pump currents, flows, pressure and levels. A micro-computer-based process controller was installed at the Orpington facility to check alarms on pressures, flows, chemical treatment/aeration tank operation and initiate corrective actions when faulty conditions occur. A computer-based telecontrol system was set up to supervise the rebuilt stations plus the West Wickham and Brasted stations based on the Type 1000 modular digital telemetry. The centralized scheme was programmed so that a fault anywhere in the system could not cause complete loss of monitoring and control. A separate recording panel was installed to allow continuous monitoring and a micro-computer system was added to process the data for future analysis and recording. Daily measurements could be obtained from two visual display terminal units (VDU) with a printer. Tracking of alarm locations from the VDU is described. A display in the control room shows by color codes which stage of water purification the system is handling. Other

control room displays and scalings are described. In the event of a computer control system failure, the controls may be actioned directly through the telemetry system. The use of computers has made the control of water a more precise art. (Geiger-FRC)

NIGHTTIME AERATION TO INCREASE PRODUCTION OF CHANNEL CATFISH,
Auburn Univ., AL.
W. D. Hollerman.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-111296, Price codes: A03 in paper copy, A01 in microfiche. MS thesis, 1980, 33 p, 6 Fig, 5 Tab. OWRT B-076-ALA (4), 14-34-0001-8001.

Descriptors: *Channel catfish, *Aeration, Dissolved oxygen, Economics, *Fish farming, *Ponds, Fish populations, Number of fish per acre, Water quality, Fish diseases, Fish production, Alabama.

Channel Catfish (Ictalurus punctatus) were stocked in 0.02- to 0.04- hectare ponds at 20,385 per hectare and fed daily. Fish averaged 11 cm total length and 6.2 g at stocking. Six ponds received daily nighttime aeration (2 to 6 hours) and six ponds received no aeration. A maximum feeding rate of 90 kg/hectare was reached by midsummer. In the aerated treatment, no dissolved oxygen (DO) problems occurred, and survival was 92%. Fish mortalities resulted from DO depletion in all ponds of the unaerated treatment, and survival was 40%. Nitrite-nitrogen concentrations were significantly higher in the aerated treatment, though never at levels reported as lethal to channel catfish. Concentrations of un-ionized ammonia in both treatments were high enough to have adversely affected growth. The aerated treatment produced an average 5,807 kg/hectare of channel catfish and had a net economic gain of $1,500 per hectare. The unaerated treatment produced an average 1,400 kg/hectare and was an obvious economic failure.
W81-00008

LIQUID AMMONIUM POLYPHOSPHATE AS A FISH POND FERTILIZER,
Auburn Univ., AL.
R. J. Metzger.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-111288, Price codes: A03 in paper copy, A01 in microfiche. MS thesis, 1980, 30 p, 4 Fig, 3 Tab. OWRT B-076-ALA (5), 14-34-0001-9101.

Descriptors: *Sunfish, Ponds, *Fertilizers, *Fish farming, Costs, Evaluation, Fish populations, Number fish per acre, * Amonium phosphate, Fish production, Liquid ammonium phosphate.

Sunfish ponds were fertilized 11 times during the growing season with liquid ammonium polyphosphate (13-38-0) at 5.6, 11.2, or 22.4 kg hectare super -1 application super -1. Net production of sunfish averaged 310, 315, and 418 kg/hectare in the low, medium, and high treatments, respectively. Net production of the high treatment differed from net production of the other two treatments. These findings suggest that 5.6 kg hectare super -1 application super -1 of liquid ammonium polyphosphate is suitable fertilization for woodland ponds with low to moderate fishing. A rate of 22.4 kg hectare super -1 application super -1 is adequate in woodland ponds with heavy fishing. Uniform surface application was the most effective technique of applying liquid ammonium polyphosphate. Liquid ammonium polyphosphate fertilization would generally be cheaper than fertilization with conventional granular fertilizers.

TANANA RIVER (AK)
Cross-Section, Velocity, and Bedload Data at Two Erosion Sites on the Tanana River Near Fairbanks, Alaska, 1979,
W81-00049 2J

TECHNOLOGY
Technology Forecasting in Water Resource Planning,
W81-00089 6A

Swedish Wastewater Technology Sets Fast Pace,
W81-00223 5D

TELEMETRY
Cleaner Tyne.
W81-00239 5D

TEST WELLS
Geologic and Hydrologic Data from a Test-Monitor Well at Fernandina Beach, Florida,
W81-00151 4B

TESTING PROCEDURES
Rapid Determination of Bacterial Water Quality Through Improved Coliform Test Procedures,
W81-00075 5A

TEXAS HIGH PLAINS
Impact of Alternative Energy Prices, Tenure Arrangements & Irrigation Technologies on a Typical Texas High Plains Farm,
W81-00032 3F

THEORETICAL ANALYSIS
Potential Use of the Tiebout Hypothesis in Water Resource Project Evaluation,
W81-00073 6B

THERMAL POLLUTION
Thermal Effects on Primary Productivity of Phytoplankton, Periphyton and Macrophytes in Lake Keowee, South Carolina,
W81-00038 5C

Thermal Stress Studies on Selected Zooplankton Species and an Isopod,
W81-00090 5C

Modeling of Heated Surface Jets,
W81-00114 5B

THERMAL WATER
Modeling of Heated Surface Jets,
W81-00114 5B

TILE DRAINAGE
Onsite Wastewater Treatment for a Recreation Area,
W81-00242 5D

TIME SERIES ANALYSIS
Shifting Level Modelling of Hydrologic Series,
W81-00207 2E

TITANIUM
Biochemical and Hematological Effects of a Titanium Dioxide Industrial Effluent on Fish,
W81-00218 5C

TOXICITY
Influence of 2,4-D and 2,4,5-T on Life History Characteristics of Chironomus (Diptera: Chironomidae),
W81-00116 5C

The Effect of Inorganic and Organic Mercury on Growth Kinetics of Nitzschia Acicularis W. Sm. and Tetraselmis Suecica Butch,
W81-00210 5C

TOXINS
Tests of Two Fluorometric Assays for Gonyaulax and Aphanizomenon Toxins,
W81-00020 5A

Effects of a Hepatic Toxin From the Cyanophyte, Microcystis Aeruginosa,
W81-00026 5A

Analysis of the Chemistry Associated with Ozonolysis of Organic Pollutant Molecules in Water,
W81-00093 5D

TRACE ELEMENTS
Development and Evaluation of Electroanalytical Methods for Determination of Metal-Ion Concentrations in Water,
W81-00013 5A

TRAP EFFICIENCY
Sediment-Trap Efficiency of a Multiple-Purpose Impoundment, North Branch Rock Creek Basin, Montgomery County, Maryland, 1968-76,
W81-00060 4D

TREATMENT FACILITIES
An Aquatic Fungus for Biological Control of Mosquito Larvae,
W81-00198 5F

Industrial Technology Adapted to Municipal Sludge Drying,
W81-00221 5E

Swedish Wastewater Technology Sets Fast Pace,
W81-00223 5D

Design and Economic Considerations of GAC Systems,
W81-00224 5D

Chemicals Substitute for Biological Treatment,
W81-00227 5D

Cleaner Tyne.
W81-00239 5D

TRIAZINE PESTICIDES
Effects of Atrazine on Chesapeake Bay Aquatic Plants,
W81-00046 5C

TRICKLING FILTERS
Application of the Aerobic-Media Trickling Filter to Nitrogen Control in Wastewater Treatment,
W81-00120 5D

TRIHALOMETHANE
A Trihalomethane Study of the Durham, New Hampshire Water Treatment Plant,
W81-00033 5A

TRIHALOMETHANES
Production, Fate and Removal of Trihalomethanes in Municipal Drinking Water Systems,
W81-00011 5F

TRITIUM
A Geochemical and Hydrological Investigation of Groundwater Recharge in the Roswell Basin of New Mexico: Summary of Results and Updated Listing of Tritium Determinations,
W81-00078 2F

Process for Concentrating Tritium and/or Tritium Hydride and Separating it from Tritium Water,
W81-00126 5D

TRITUM
Water Distribution and Movement in an Unsaturated Piedmont Soil Profile,
W81-00042 5B

TROPICAL REGIONS
Research Priorities in Tropical Biology,
W81-00212 7A

TUNNELS
Oxford City Gets New Trunk Outfall Sewer. Wedge Block Tunnel Saves Christchurch Meadows and 3 Million Pounds,
W81-00234 8A

TURBIDITY
Optimum Alum Dose Selection for the Durham Water Treatment Plant,
W81-00028 5F

U. S. GEOLOGICAL SURVEY
The U.S. Geological Survey in Alaska, 1980 Programs,
W81-00051 7C

ULTIMATE DISPOSAL
Fluid Bed Incineration,
W81-00226 5E

Direct Polymer Injection,
W81-00249 5E

UNAKWIK INLET (ALASKA)
Preliminary Bathymetry--Approaches to Unakwik Inlet, Alaska.
W81-00139 7C

UNDERGROUND STRUCTURES
Underground Dereliction in the North West.
W81-00233 4C

UNITED NATIONS
The International Drinking Water Supply and Sanitation Decade Prepares for Launching,

UNSATURATED FLOW
Water Distribution and Movement in an Unsaturated Piedmont Soil Profile.
W81-00042 5B

UPPER VERDE RIVER AREA (AZ)
Maps Showing Ground-Water Conditions in the Upper Verde River Area, Yavapai and Coconino Counties, Arizona--1978,
W81-00156 7C

URBAN HYDROLOGY
Urban Water Balances Considering Conservation,
W81-00162 3D

Hydrology and Political Influences on Water Supply,
W81-00169 3F

Technology Assessment of Hydrology for Water Resource Management in Urbanizing Areas,
W81-00192 6B

URBAN RUNOFF
Hydrological and Environmental Controls on Water Management in Semiarid Urban Areas,
W81-00006 4C

Effects of Urban Runoff and Wastewater Effluent on Wilsons Creek and James River Near Springfield, Missouri,
W81-00065 4C

Systems Analysis of Urban Storm Water Detention Basins,
W81-00102 6A

URBANIZATION
Effects of Conservation Measures on Water Demands,
W81-00184 3D

Technology Assessment for Water Resource Management in Urbanizing Areas,
W81-00190 6B

An Assessment of Nonpoint Source Technology for Water Resource Management in Urbanizing Areas,
W81-00191 6B

Literature Review for Water Supply for Urbanizing Areas,
W81-00193 6B

Technology Assessment and Research Needs of Water-Based Recreation for Urbanizing Areas,
W81-00194 6B

Existing Base and Relevant Practices -- Institutional Arrangements for Water Resource Management in Urbanizing Areas,
W81-00195 6B

Underground Dereliction in the North West,
W81-00233 4C

UTAH
Ground-Water Conditions in Utah, Spring of 1980,
W81-00150 2F

VERTICAL MIGRATION
The Role of Zooplankton Vertical Migration in Structuring the Phytoplankton Community,
W81-00021 2H

Arctic Investigations of Some Factors that Control the Vertical Distributions and Swimming Activities of Zooplankton,
W81-00084 2H

VIRGINIA
Water Conservation needs and Approaches in Humid Areas,
W81-00175 3D

VIRUSES
Inactivation of Coxsackieviruses B3 and B5 in Water by Chlorine,
W81-00216 5F

VTE BOILER
Design Study of the VTE Boiler Cycle for the Desalination of Sea Water Volume 1. Main Report and Appendix A,
W81-00071 3A

WASHINGTON (DC)
Drought Effects on Metropolitan Washington, D.C. Area,
W81-00179 6E

Effects of Conservation Measures on Water Demands,
W81-00184 3D

Risk Management in Water Supply Planning,
W81-00188 6A

WASTE ASSIMILATIVE CAPACITY
Characterization and Land Application of Seafood Industry Wastewaters,
W81-00079 6B

WASTE DISPOSAL WELLS
Hydrogeologic Data for the McKay Creek Subsurface Waste-Injection Test Site, Pinellas County, Florida,
W81-00152 3C

WASTE WATER
Wastewater Helps the Barley Grow,

SELECTED WATER RESOURCES ABSTRACTS

VOLUME 14, NUMBER 2
JANUARY 15, 1981

W81-00251 - W81-00500
CODEN: SWRABW

SELECTED WATER RESOURCES ABSTRACTS (SWRA) is produced by the Office of Water Research and Technology, U.S. Department of the Interior, and published twice monthly by the National Technical Information Service (NTIS), U.S. Department of Commerce.

SWRA is available to Federal agencies and their contractors or grantees in water resources research upon request, citing contract or grant number and sponsoring agency. Write: Office of Water Research and Technology, U.S. Department of the Interior, Washington, DC 20240. The **SWRA Journal** is also available on subscription from NTIS, 5285 Port Royal Road, Springfield, VA 22161. Annual subscription rates for the North American Continent are: Journal only, $100; Journal and Annual Indexes, $125; Indexes only, $50. Other addressees, write for prices.

Some documents abstracted in this journal can be purchased from NTIS. Price codes are given in the entries and a current code-price conversion table is printed on the outside back cover. Other documents are available from originating organizations or authors as indicated in the citation.

SELECTED WATER RESOURCES ABSTRACTS

A semimonthly publication of the Office of Water Research and Technology,
U.S. Department of the Interior

VOLUME 14, NUMBER 2
JANUARY 15, 1981

W81-00251 -- W81-00500

The Secretary of the Interior has determined that the publication of the periodical is necessary in the transaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1983.

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

PREFACE

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. These documents cover water resources as treated in the life, physical, and social sciences and the related engineering and legal aspects of the characteristics, supply condition, conservation, control, use, or management of water resources. Each abstract includes a full bibliographic citation and a set of descriptors which are listed in the **Water Resources Thesaurus.** The abstract entries are classified into 10 fields and 60 groups similar to the water resources research categories established by the Committee on Water Resources Research of the then Federal Council for Science and Technology.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several services of the Office of Water Research and Technology. The cumlative SWRA file from 1968 and montlhy updates are available also in magnetic tape through lease from NTIS.

THE OFFICE OF WATER RESEARCH AND TECHNOLOGY DOES NOT PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Comments and suggestions concerning the contents and arrangement of this bulletin are welcome.

CONTENTS

SUBJECT FIELDS AND GROUPS

Please use the edge index on the back cover to locate Subject Fields and Indexes.

01 NATURE OF WATER

Includes the following Groups: Properties; Aqueous Solutions and Suspensions.

02 WATER CYCLE

Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION

Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL

Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Nonwater Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION

Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING

Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA

Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS

Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES

Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION

Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

BOUNDARY MIXING IN DENSITY-STRATIFIED FLUIDS,
California Univ., Berkeley.
G. N. Ivey.
Phd Dissertation July 1980. 123 p, 40 Fig, 4 Tab, 52 Ref. (California Water Resources Center Project UCAL-WRC-W-525).

Descriptors: *Boundary processes, *Vertical migration, *Turbulence, *Density, *Stratification, *Mixing, Oceans, Hypolimnion, Epilimnion, Flux, Lakes, Physical properties, Dyes, Pycnocline.

A knowledge of mixing processes in the world's natural water bodies is vital to understanding many aspects of water quality control. These water bodies are commonly density-stratified and the stratification inhibits the mixing processes. One proposed and as yet poorly understood mechanism of mixing in density-stratified fluids is caused by turbulence at boundaries which cross isopycnic surfaces. This study utilizes a laboratory experiment to investigate a simple example of such mixing. Dye observations suggest that very little vertical mixing occurs in the interior as a result of the intrusions. The net vertical mass flux, which is both observed and measured in the experiment, is accompanied by a gradual change in the vertical density distribution. The dependence of the net vertical mass flux on several parameters is measured and the results are compared with the existing models of boundary mixing. (Garrison-Omniplan)
W81-00390

A BIOLOGIST'S VIEW ON THE ROLE OF WATER CHEMISTRY IN ENVIRONMENTAL ASSESSMENT,
Department of Indian and Northern Affairs, Ottawa (Ontario).
E. K. Langtry.
In: Proceedings of the Technology Transfer Workshop, Environmental Impact Assessment in the North, Oct 31, Nov 1-2, 1978. Inland Waters Directorate, Ottawa, Ontario, Canada, Technical Workshop Series No 1, p 14, 127-138, 1979. 2 Fig, 2 Tab, 1 Ref.

Descriptors: *Environmental impact assessment, *Arctic, *Northern development, *Environmental effects, *Water chemistry, Water quality, Limnology, Water properties, Biological properties, Sampling, Water analysis, Canada.

Water chemistry is important for environmental assessment purposes, but traditional studies have often failed to assist in impact predictions. Biological analysis by itself does not define water quality precisely and should be correlated with water chemistry. The variability in chemical data can be controlled and identified with suitable study schemes. Proper sample handling and analyses by trained chemical technicians will eliminate variance due to human error. The variability characteristic of natural waters, both temporally and spotially, can be accurately estimated by careful selection of sampling frequencies and good network design. Chemical studies will achieve their maximum value when they are integrated with research in other environmental disciplines. A thorough understanding of ecological processes can be gained through intensive research on selected aquatic systems, rather than by reconnaissance type inventorying. The predictive capability that will be generated from modelling exercises will improve the quality of environmental impact evaluations. (WATDOC)

ANALYSES OF WATER, BANK MATERIAL, BOTTOM MATERIAL, AND ELUTRIATE SAMPLES COLLECTED NEAR BELZONI, MISSISSIPPI (UPPER YAZOO PROJECTS),
Geological Survey, Baton Rouge, LA. Water Resources Div.
D. B. Brightbill, and J. B. Treadway, Jr.
Available from OFSS, USGS, Box 25425, Fed. Ctr., Denver, CO. 80225, Paper copy $2.25, microfiche $4.00. Geological Survey Open-File Report 80-758, July 1980. 11 p, 1 Fig, 1 Plate, 4 Tab, 11 Ref.

Descriptors: *Water analysis, *Water quality, *Core drilling, *Bottom sediments, *Chemical analysis, Dredging, Flood control, Heavy metals, Pesticides, Physical properties, Sediments, Particle size, Hydrologic data, Mississippi, *Upper Yazoo projects.

Four core-material-sampling sites and one bottom-material site were chosen by the U.S. Army Corps of Engineers to represent areas of proposed dredging activity along a 24.9-mile reach of the upper Yazoo River. Five receiving-water sites also were selected to represent the water that will contact the proposed dredged material. Chemical and physical analyses were performed upon core or bottom material and native-water (receiving-water) samples from these sites as well as upon elutriate samples of the mixture of sediment and receiving water. The results of these analyses are presented without interpertation. (USGS)

BASIN STUDY: BATHURST ISLANDS, 1976,
Water Survey of Canada, Ottawa (Ontario).
J. H. Wedel.
In: Proceedings of the Technology Transfer Workshop, Environmental Impact Assessment in the North, Oct 31, Nov 1-2, 1978. Inland Waters Directorate, Ottawa, Ontario, Canada, Technical Workshop Series No 1, p 15, 141-144, 1979.

Descriptors: *Watersheds, *Hydrologic data, Runoff, Sedimentation rates, Snowmelt, Mathematical models, Flow, Sediment transport, Sediment yield, Waterbudget, *Bathurst Island, *Arctic, Canada.

An intensive basin study on Western Bathurst Island was undertaken in year two of the Arctic Islands pipeline study. The basin was situated in region of fairly uncohesive soils and little previous hydrologic data. The field program assembled meteorologic, hydrologic and sediment data for the runoff period in 1976. Subsequent analysis produced an empirical relation of runoff derived from resolute bay precipitation data, some mathematical models describing snowmelt, streamflow and sediment discharges, and values in a water budget for the basin. The results indicated that annual runoff and sedimentation rates were greater than those shown in the current hydrologic atlas. (WATDOC)

2C. Snow, Ice, and Frost

SPATIAL SIMULATION OF SNOW PROCESSES,
Colorado State Univ., Fort Collins. Dept. of Earth Resources.
A. G. Thomsen, and W. D. Striffler.
In: Proceedings Symposium on Watershed Management, Boise, Idaho, July 21-23, 1980. Vol I, p 326-334, (1980). American Society of Civil Engineers, New York, NY. OWRT-B-160-COLO(4), 5-31640.

Descriptors: Snow, Remote sensing, *Spatial distribution, *Model studies, *Snowfall, *Snowmelt, Watersheds(Basins), Snow cover, Moisture content, Streamflow, Topography, Vegetation, Soils, *Colorado, Rocky Mountains.

A spatially distributed model for the simulation of snow accumulation and melt in the Central Rocky Mountains in Colorado is discussed. Snow processes are simulated within square (5.76 ha) grid cell elements. Parameter decks for operating the simulation model on specified watersheds are generated automatically from watershed information (topography, vegetation and soils) in digital terrain models. The computer program that generates the parameter deck, has calibration options for all major processes which permits model calibration on watersheds with varying characteristics within the region. The hydrograph resulting from spring snowmelt is simulated by a lateral flow model of streamflow generation driven by the spatially distributed input (snowmelt + rain). Parameter decks for operating the lateral flow model are likewise generated automatically from digital terrain models. Line printer generated map overlays, showing simulated snowcover parameters (depth, temperature) as well as the moisture content of the rooting zone, can be produced for any date between April 1 and July 31.

GLACIER SURVEYS IN BRITISH COLUMBIA - 1978,
Inland Waters Directorate, Ottawa (Ontario).
I. A. Reid, and I. O. G. Charbonneau.
Report Series No 66, 1980. 23 p, 9 Ref, 39 Tab, 8 Fig, Maps.

Descriptors: *Glaciers, *Surveys, *History, *Aerial photography, Topographical maps, British Columbia, Alberta, Hydrological studies, Stereoscopic terrestrial surveys, Water supply, Snowmelt, Water storage, Streamflow, *Canada.

Glaciers act as natural regulators, storing water in winter and releasing it in summer. To gain some understanding of this phenomenon and the contribution which glaciers make to streamflow, the predecessors of the Water Survey of Canada began glacier surveys in 1945. The earlier surveys offered some clue to the role of the glacier, but the data collected were not sufficient to provide the overall picture. Following adoption of photogrammetric survey techniques, however, the glacier surveys have evolved to the extent that it is now feasible to produce a series of maps from which the linear, areal, directional and volumetric changes can be determined. The surveys have revealed that the glaciers, in general, are becoming smaller in size; hence the regulating effect on streamflow is dimishing. (WATDOC)

CREEP AND GLIDE PROCESSES IN MOUNTAIN SNOWPACKS,
National Hydrology Research Inst., Ottawa (Ontario).
D. M. McClung.
NHRI Paper No 6, 1980. 66 p, 19 Fig, 32 Ref, 1 Tab.

Descriptors: *Avalanches, *Snowpacks, *Physics, *Models, *Velocity, Snow pressure, Shear stress, Strain rates, Snow pressure, Poisson ratios, Creep, Glide, Deformation, *Canada.

Group 2C—Snow, Ice, and Frost

Creep and glide processes in mountain snowpacks are discussed from the point of view of relevant constitutive equations for internal deformation (creep) in the material and slip boundary conditions (glide) at the base of slabs or the entire snowpack. The emphasis on the creep equations is to attain a formulation which is easily applicable in problems and which matches the known characteristics of field data rather that the most general equation. For glide, constitutive equations relating drag shear stress, tau, to slip velocity are given for three mechanisms for neutral zone conditions and a step toward the formulation of a general theory of snow gliding is made. Non-neutral zone glide boundary conditions are also introduced, and these are related to release of full depth and wet slab avalanches and to the problem of snow pressure on avalanche defence structures. Porous media effects on glide are also discussed. (WATDOC)

DISCUSSION ON SNOWMELT,
Waterloo Univ. (Ontario). Dept. Systems Design.
P. Baracos.
In: Proceedings of the Technology Transfer Workshop, Environmental Impact Assessment in the North, Oct 31, Nov 1-1, 1978. Inland Waters Directorate, Ottawa, Ontario, Canada, Technical Workshop Series No 1, p 16, 147-155, 1979. 8 Ref.

Descriptors: *Environmental impact assessment, *Arctic, *Northern development, *Environmental effects, *Snowmelt, Measurement, Mathematical models, Runoff, Stochistic models, Equations, Canada.

Runoff generated from snowmelt constitutes the bulk of yearly flow in the north. Prediction of runoff volumes and their temporal distribution can be obtained from measurements of snow quantity and by modeling melt processes. Such predictions are important to water related developments, to environmental impact assessment, to estimated missing hydrometric data and to extend existing records. AES snow gauges undercatch snowfall in the barren lands and the relocation of snow by drifting is not addressed. Snow surveys, prior to runoff, supply accurate water content data provided that snow courses are designed to sample basin terrain units in a representative way. Snowmelt models may be explicit of implicit and based on meteorologic parameters in a heat balance model or be based on empirical, simple regress ion models tailored to fit site-specifics: (1) identifying the best model type, (2) estimating model parameters and (3) diagnostic checking. New computer programs make the 3-stage process quite straightforward. Intervention analysis by means of stochastic models promises to be a most useful tool in impact assessment. A transter-function model relating runoff time series to precipitation and temperature is currently under development for the implicit modelling of snowmelt. The akaike information criterion provides a useful, unbiased criterion for model selection. The criterion considers goodness of statistical fit and model simplicity. (WATDOC)
W81-00464

ICE JAMMING CONCERNS AND OPERATIONAL SOLUTIONS,
Inland Waters Directorate, Halifax (Nova Scotia).
E. R. Langley.
In: Proceedings of the Technology Transfer Workshop, Modelling Activities Related to Flood Damage Reductions, Hull, Quebec, May 23-25, 1979. Inland Waters Directorate, Ottawa, Ontario, Canada, Technical Workshop Series No 2, p 198-210, 1980. 4 Ref.

Descriptors: *Flood risk mapping, *Ice jams, *Hydrologic data, *Model studies, *Flood control, Recurrence intervals, Data collections, Perth-Andover, Ontario, Truro, Nova Scotia, Canada.

Examination of ice jamming case histories and the limited technical information available on the subject indicate that there is a need to develop guidelines for including the effects of ice jams in flood risk mapping work and an even greater need to obtain reliable information on ice jam events. In the meantime, it is proposed that each location be considered separately to determine the best method of including the ice jamming aspects in flood risk mapping. (WATDOC)
W81-00475

HYDRAULIC ASPECTS OF ICE JAMMING,
Canada Centre for Inland Waters, Burlington (Ontario).
G. Tsang.
In: Proceedings of the Technology Transfer Workshop, Modelling Activities Related to Flood Damage Reductions, Hull, Quebec, May 23-25, 1979, Inland Waters Directorate, Ottawa, Ontario, Canada, Technical Workshop Series No 2, p 211-227, 1980. 8 Fig, 1 Tab, 7 Ref.

Descriptors: *Ice jams, Frazil ice, Crystals, *Snowmelt, Equations, Mathematics, Models, Hydraulics, Flows, Shears, Stress, Roughness, *Flood damage, *Flood control, Canada.

The physical factors affecting ice formation and ice jamming are reviewed. Although it is possible to predict the occurrence of ice jamming with a certain degree of confidence, many problems remain unsolved including ice jam flooding characteristics, instability of ice cover, and the evolution of dynamic jams and their resistance to flow. (WATDOC)

2D. Evaporation and Transpiration

OXYGEN EXCHANGE BETWEEN A 'MODEL' POND AND THE ATMOSPHERE,
Science and Education Administration, Durant, Southern Plains Watershed and Water Quality Lab.
O. R. Lehman.
Advances in Water Resources, Vol 3, No 2, p 87-89, June, 1980. 2 Fig, 2 Tab, 15 Ref

Descriptors: *Ponds, *Dissolved oxygen, *Air-water interfaces, Model studies, Atmosphere, Limnology, Water temperature, Winds, Rainfall, Precipitation, Weather, Air temperature, Environmental effects.

A glass-coated steel model pond 6 m in diameter and 2.5 m deep was placed in the ground under sheltered conditions to study oxygen exchange from April to December. The clean pond was filled with tap water, and disinfectant was added to control biological activity. Rain was the only uncontrolled water source. Oxygen exchange was calculated using daily dissolved oxygen measurements throughout the water column at 0800, 1300, and 1800 hr. Average oxygen exchange from April to December was 0.33 m/day. This level of exchange was in agreement with data reported for isolated surfaces in sheltered waters and in laboratory tanks, but was below values reported for large inland water bodies. The low oxygen exchange rate was attributed to a low average wind velocity (0.7 m/sec). It was suggested that the relationship of air and precipitation to water temperatures may be important in determining the rate of short-term oxygen exchange in sheltered waters. (Geiger-FRC)

2E. Streamflow and Runoff

PROCEEDINGS, 14TH ANNUAL MISSISSIPPI WATER RESOURCES CONFERENCE, 24-25 SEPTEMBER 1979,
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-124430, Price codes: A06 in paper copy, A01 in microfiche. Conference held in Jackson, Mississippi '1979), 116 p. Water Resources Research Institute, Mississippi State University, Mississippi State. OWRT-A-999-MISS(15).

Descriptors: *Mississippi, *Conferences, *Tennessee-Tombigbee Waterway, Project planning, Environmental effects, Engineering structures, Regional economics, Dam failure, Flood damage, Erosion control, Sediment yield, Agriculture, Spillways, Mathematical studies.

Twenty of the twenty-one papers presented at the conference are given covering the areas of resource development, runoff and erosion, floods and flood plains, and water quality. Five of the papers center around the Tennessee-Tombigbee Waterway now under construction to provide a navigable waterway connecting the Tennessee River and the Gulf of Mexico. Other topics include dam safety, environmental impact assessment, streambank erosion, sediment yields, river crossings, crop damage assessment, remote monitoring systems, and water quality enhancement techniques. STATISTICAL ANALYSIS OF STREAM EVENTS,
Mississippi State Univ., Mississippi State. Dept. of Civil Engineering
V. L. Zitta, and B. A. Mowry.
In: Proceedings, 14th Annual Mississippi Water Resources Conference, 24-25, September 1979. p 33-41, (1979) 13 Fig, 7 Ref.

Descriptors: *Statistical analysis, *Mississippi, *Flow characteristics, Flow profiles, Flow rates, Frequency analysis, Probability, Stochastic process, Synthetic hydrology, Mathematical studies, Distribution patterns, *Streamflow, Stream gages, Water measurement.

Long term records of daily stream flows in Mississippi were used to determine: (1) the monthly distribution of time between stream events; (2) the mean annual spans between events as related to drainage area; and (3) a probability density function applicable to the distribution of maximum annual span between events. Data used were on tape furnished by the U.S. Geological Survey. The tapes were searched for the longest period of record exhibiting stationarity, homogeneity, and consistency. The Pearl River Station at Edinburg was chosen for the analysis. Mean monthly spans and standard deviation for each month of the year were determined and related to drainage area. Frequency distributions were then determined for an annual series of maximum spans. The Kolmogorov-Smirnov test of goodness of fit was used and empirical plotting positions were based on Weibull's plotting position formula. From the distribution plots it is concluded that: (1) mean monthly spans are cyclic with maximums in October and February/March and minimums in December and July/August; (2) average spans between events tend to increase with increasing drainage area; and (3) a two parameter lognormal distribution was adequate to describe the distribution of maximum annual spans at the 0.80 significance level. W81-00298

QUICK ESTIMATION OF PARAMETERS OF MUSKINGUM METHOD OF FLOOD ROUTING,
Mississippi State Univ., Mississippi State. Dept. of Civil Engineering.
V. P. Singh, and R. C. McCann.
In: Proceedings, 14th Annual Mississippi Water Resources Conference, 24-25, September 1979. p 65-69, (1979) 2 Fig, 2 Tab, 26 Ref.

Descriptors: *Muskingum method, *Flood routing, *River forecasting, Mathematical models, Least squares method, Optimization, Analytical techniques, Mathematical studies, Method of moments, Method of cumulants, Probability, Parametric hydrology, Estimating.

Five methods for determining Muskingum parameters are illustrated to evaluate the efficiency of each method. The method used are: (1) least squares, (2) method of moments, (3) method of cumulants, (4) graphical, and (5) direct optimization. The Muskingum method for routing flood waves in rivers and channels was developed in 1934. It is a spatially lumped form of a continuity equation and a linear storage-discharge relationship for a specified river reach. Its effectiveness de-

pends on the accuracy of parameters estimation which is typically done graphically. The results of an application example for the various methods of determining parameters suggest that there may be more than one set of parameters for the Muskingum method. Results are comparable indicating that the trial and error graphical method is no better than the other methods. The computations needed for the method of cumulants and moments, least squares method, and the direct optimization are small and can be easily performed with a small calculator. W81-00303

VARIATIONS OF A MISSISSIPPI RIVER CROSSING WITH STAGE,
Army Engineer District, Vicksburg, MS.
J. V. Hines.
In: Proceedings, 14th Annual Mississippi Water Resources Conference, 24-25, September 1979. p 71-79, (1979) 11 Fig, 2 Tab.

Descriptors: *Mississippi River, *Crossings, *Channel morphology, Channel erosion, Scour, Thalweg, Sedimentation, Dredging, Water levels, Flood stages, Flood damage, Streamflow, River beds, Meanders, *Vicksburg(MS).

Changes in bed elevation of a crossing as affected by a flood hydrograph were studied at a well-defined crossing near Vicksburg, Mississippi. A crossing is that reach of river within which the thalweg shifts from one side of the channel to the other. Due to sedimentation from floods some crossings in the Mississippi have required dredging to reopen the channel depths needed for navigation. Data were collected by a Mini-Ranger III automatic positioning system which consists of a control unit with an omni-directional receiving antenna on a boat. Two transponders were located on the bank so that the entire survey area was under line-of-sight conditions. The survey area was divided into a series of 30 parallel track lines which provided for 3,700 data points per square mile. Computerized plots of data were prepared and data were stored by lines as a series of depths. Results show that for a well defined crossing the bed elevation will follow a pattern similar to that of the stage hydrograph. Volume variation shows that the upper end of the crossing is scouring at the beginning. As the stage rises the crossing moves upstream and as the stage crests, volume stabilizes, then slowly increases, dhowing a short lag before the bed begins to scour. Due to the many variables involved, the results of this study should not be freely applied to all crossings. (See also W81-00290) (Seigler-IPA)
W81-00304

EXPANDED FLOODPLAIN INFORMATION STUDY FOR THE WOLF RIVER BASIN, TENNESSEE AND MISSISSIPPI: A COMPUTER SIMULATION,
Army Engineer Waterways Experiment Station, Vicksburg, MS.
T. L. Engdahl, and J. G. Collins.
In: Proceedings, 14th Annual Mississippi Water Resources Conference, 24-25, September 1979. p 81-85, (1979) 4 Fig, 3 Ref.

Descriptors: *Mississippi, *Simulation analysis, *Computer moels, Computer programs, Data processing, Flood forecasting, Hydrograph analysis, Watersheds(Basins), Hydrology, Flood profiles, Flood plains, Flood data, Flow characteristics, *Wolf River basin(MS-TN).

A simulation system was developed for the Wolf River basin to be used as a planning tool to forecast the impacts of land use, channel modifications, and the addition of hydraulic structures. The Wolf River basin is approximately 65 miles in length, ranges from 10 to 15 miles in width, and has an area of 817 square miles. There are more than 400 miles of stream channels within the basin. Data on channel and overbank roghness, precipitation, gaging, cross-sections, and other areal characteristics were obtained from various agencies. The 'Flood Hydrograph Package', HEC-1, was used to compute, route, and combine hydrographs. Forty-seven subbasins were divided into minibasins for runoff computations. A grid system of subdivisions was also used. Three data bases were used for hydrologic and hydraulic analyses. Three major supporting programs were developed in addition to the software routines for the data bases. A program written to access the cross-section file can output an input deck for a subbasin including tributaries. A program, FLOOD, accesses the water elevation files. The system developed can be easily modified for updating and research and the methodologies developed are generally applicable to any basin. A flow chart of the hydrologic-hydraulic simulation process is include. (See also W81-00290) (Seigler-IPA)
W81-00305

COMPUTERIZED AGRICULTURAL CROP FLOOD DAMAGE ASSESSMENT SYSTEM,
Army Engineer District, Vicksburg, MS.
W. B. Hobgood, and T. C. Hill.
In: Proceedings, 14th Annual Mississippi Water Resources Conference, 24-25, September 1979. p 87-88, (1979).

Descriptors: *Flood damage, *Agriculture, *Computer programs, Crop production, Hay, Wheat, Soybeans, Pastures, Flood data, Regional flood, Assessments, Evaluation, Flood stages, Computer models.

CACFDAS, the Computerized Agricultural Crop Flood Damage Assessment System, uses historical data on a daily basis, current budget data, present cropping patterns and production techniques, and other data to evaluate flood damages. CACFDAS analyzes the effects of physical factors such as depth, duration, and seasons of flooding on crop specific flood damages. The input system consists of the following: initial reach crop distribution data, expected net and gross for each crop, alternative substitution crop data, last date of replanting data, computerized crop budget data, itemized cultural or operation practices, and digitized stage-area data. Digitized data is read until a flood is defined. Floods are divided into minifloods or bands of inundation to account for differential dryout periods. Crops are classified as spring crops, winter crops, pasture, hay, and wheat-soybean double crop. Damages are calculated on area flooded, duration, and initial crop distribution. Three output formats are available: (1) brief, reports damages per flood year and summarizes each reach; (2) normal, reports damages for each flood, for each year, for each reach; and (3) debug, reports damages for each year, for each reach, with debugging down to the 'band' level. WINTER WATER--THE FLOODING AT BOISE, IDAHO, JANUARY 11-12, 1979,
Geological Survey, Boise, ID. Water Resources Div.
R. W. Harper, and E. F. Hubbard.
Available from OFSS, USGS, Box 25425, Fed. Ctr., Denver, CO 80225, paper copy, $3.50, microfiche $0.50. Geological Survey Open-File Report 80-201 (WRI), 1980. 1 Sheet, 5 Fig, 1 Tab, 2 Ref.

Descriptors: *Flooding, *Idaho, *Rainfall, *Snowmelt, *Storm runoff, Air temperature, Thawing, Streams, Flood stages, Peak discharge, Indirect flood measurement, Flood damage, Water quality, Flood protection, Planning, Flood forecasting, Boise(ID).

On January 11 and 12, 1979, unseasonally warm temperatures and rain on several inches of snow lying on frozen ground caused widespread flooding in and around Boise, Idaho. Streams north of Boise crested on January 11, flooding neighborhoods in and adjacent to the mountain foothills. On January 12, streams south and west of the city reached their highest stages. Flooding was confined to ground levels and basements of homes and businesses in low-lying areas. The U.S. Geological Survey made indirect measurements of peak discharges at selected sites on streams that had the worst flooding. The peak discharges were relatively low in comparison with data from historic floods. Much more severe flooding than this event is likely to occur in the future. More data are needed on the occurrence of flooding in Boise Valley to aid in flood-protection planning. (USGS)
W81-00364

REPORT ON WORKING GROUP NO. 1. OPEN CHANNEL HYDRAULIC MODELLING,
National Water Research Inst., Burlington (Ontario).
T. M. Dick.
In: Proceedings of the Technology Transfer Workshop, Modelling Activities Related to Flood Damage Reduction, Hull, Quebec, May 23-25, 1979. Inland Waters Directorate, Ottawa, Ontario, Canada, Technical Workshop, Series No 2, p 8-12, 1980.

Descriptors: *Hydraulic models, Analytical techniques, *Flood damage, Flood control, *Management, Research and development, Performance, *Open channel flow, Canada.

The choice of models for flood level prediction is limited. Of primary concern is the reliability of the calculations which are translated eventually into action to reduce flood damage. Computational problems and routines are the main concern of modellers, but management is more concerned with the result. There should be greater priority given to establishing the reliability and accuracy of models; thus more research and development activity, especially to verify statistically the performance of models, is probably needed. (WATDOC)
W81-00465

REPORT ON WORKING GROUP NO. 2. HYDROLOGIC MODELLING,
National Hydrology Research Inst., Ottawa (Ontario).
F. I. Morton, and W. Nemanishen.
In: Proceedings of the Technology Transfer Workshop, Modelling Activities Related to Flood Damage Reductions, Hull, Quebec, May 23-25, 1979. Inland Waters Directorate, Ottawa, Ontario, Canada, Technical Workshop Series No 2, p 13-18, 1980. 2 Tab.

Descriptors: *Hydrologic models, Research and development, *Runoff, Workshop, Technology transfer, *Flood damage, *Flood control, Canada.

Participants were requested to address themselves to three of the workshop objectives. There were: (A) Identification of gaps in knowledge requiring research, (B) Identification of related technical questions requiring further study and/or detailed information transfer, (C) Identification of improved methods for effecting technological transfer. (WATDOC)
W81-00466

REPORT ON WORKING GROUP NO. 3. STOCHASTIC ANALYSIS AND OPERATIONAL RESEARCH,
Inland Waters Directorate, Ottawa (Ontario).
R. L. Pentland.
In: Proceedings of the Technology Transfer Workshop, Modelling Activities Related to Flood Damage Reductions, Hull, Quebec, May 23-25, 1979. Inland Waters Directorate, Ottawa, Ontario, Canada, Technical Workshop Series No 2, p 19-22, 1980. 3 Tab.

Descriptors: *Flood frequency analysis, Findings, Research requirements, *Flood damage, *Flood control, Canada.

The working group discussed four broad categories: frequency analysis at gauged sites; ungauged sites and regional analysis; large lake/coastal situa-

tions and reservoir operation; and physical interventions. For each of these, the group identified findings and research needs which attempted to address, respectively, findings of general value to operational people in the flood damage reduction program, and links which should be made between the program and research-programs. The findings and conclusions are summarized. A summary is provided of more general conclusions reached by the group which are considered important to the FDR program but which could not be classified along with the more specific conclusions. Also included, for general information, is a survey of the numbers of agencies using various frequency analysis techniques. (WATDOC)

SIMPAK FOR RIVER BASIN STUDIES,
Inland Waters Directorate, Vancouver (British Columbia).
J. C. Y. Lee, and R. O. Lyons.
In: Proceedings of the Technology Transfer Workshop, Modelling Activities Related to Flood Damage Reductions, Hull, Quebec, May 23-25, 1979. Inland Waters Directorate, Ottawa, Ontario, Canada. Technical Workshop Series No 2, p 93-109, 1980. 6 Fig.

Descriptors: *Streamflow routing, Diversion, *Flood forecasting, *River modelling, Simulation, Flow nets, Hydrologic SIMPAK program, SSARR, *Flood control, Fraser River, Columbia River, Mackenzie River, Research and development, Canada.

In several studies in the Pacific and Yukon Region, streamflow routing models have been used to determine the downstream effects of various reservoir or diversion projects. In the earlier studies, the SSARR Program was adopted as one of the vehicles for routing studies in the region. However, only a fraction of the capabilities of SSARR were required for this task. The desired result could be achieved by simply using the routing methods of the SSARR Program and building a separate program framework to do all the data handling. Thus, the simulation package (SIMPAK) for river modelling was developed and used by the Vancouver Office of Inland Waters Directorate for several river basin studies. It has been used to perform river routing and reservoir regulation, critical flood flow forecasting and other operations involving manipulation of streamflow data. The critical flood flow forecasting was developed specifically for day-to-day reservoir flood control operation. The technique derived for the forecasts is a simplified approach yet provides a workable and useful tool for reservoir operation. This paper describes the features of the program, provides a comparison with the SSARR model, and describes some applications. (WATDOC)

DEVELOPMENT OF A REAL-TIME OPERATIONAL MODEL FOR THE OTTAWA RIVER - A PROGRESS REPORT,
Inland Waters Directorate, Ottawa (Ontario).
G. A. Nix.
In: Proceedings of the Technology Transfer, Workshop Modelling Activities Related to Flood Damage Reductions, Hull, Quebec, May 23-25, 1979. Inland Waters Directorate, Ottawa, Ontario, Canada. Technical Workshop Series No 2, p 110-130, 1980. 6 Fig.

Descriptors: *Flood control, *Flood forecasting, *Model studies, Warning systems, River regulation, Ottawa River, Forecasting reservoir operation, Peak discharge, Hydrologic data, Development, Testing, Input data, Output format, Canada.

In May, 1974, a Canada-Quebec agreement was signed that initiated studies on flooding and low water problems in the Montreal region, the study report recognized that any potential for reducing flooding in the Montreal region lay in optimizing the operation of the many reservoirs in the Ottawa River basin. As a result of the recommendations in the report, the Ottawa River Regulation Planning Committee was formed in February, 1977. The Committee formed a subcommittee to recommend criteria for regulation of the Ottawa River, taking into account hydro power production, flood protection, navigation, low water problems, water quality needs and recreation. A working group was then formed to develop a mathematical model for the regulation of the Ottawa River. This report describes the progress towards the development of the model. (WATDOC)

M. Sydor, and P. Zrymiak
In: Proceedings of the Technology Transfer Workshop, Modelling Activities Related to Flood Damage Reductions, Hull, Quebec, May 23-25, 1979. Inland Waters Directorate, Ottawa, Ontario, Canada. Technical Workshop Series No 2, p 141-145, 1980.

Descriptors: *Flood control, *Flood damage, *Mathematical models, *Dynamic programming, Water discharges, Sediment data, Input-output analysis, Fraser River, Canada.

A one dimensional finite difference hydrodynamic model has been applied to the complex channel system of the lower Fraser River. The input data was a set of approximately 700 cross sections collected by the Department of Public Works in 1962 and 1976. Initial success using the model was realized by calibrating to a discharge of 350,900 CFS discharge on July 12, 1976, and by simulating the June 4, 1976 river condition when 227,500 CFS was recorded. With such encouraging results, the studies are continuing and various periods are to be studied in order to determine the range of accuracy possible in using this model. (WATDOC)

APPLICATION OF THE DWOPER MODEL TO THE LOWER SAINT JOHN RIVER,
MacLaren (James F.), Willowdale (Ontario).
H. S. Belore, A. K. Bhattacharyya, and C. T. Bishop.
In: Proceedings of the Technology Transfer Workshop, Modelling Activities Related to Flood Damage Reductions, Hull, Quebec, May 23-25, 1979. Inland Waters Directorate, Ottawa, Ontario, Canada, Technical Workshop Series No 2, p 146-162, 1980. 4 Fig, 2 Tab, 19 Ref.

Descriptors: *Flood routing, *Model studies, Flow, Hydraulics, *Flood profiles, Hydrologic data, *Flood control, Physical data, Numerical analysis, Recurrence intervals, Data base systems schematization, Mathematics, Simulation analysis, Hydrograph analysis, *Flood forecasting, Saint John River, Canada.

An unsteady flood routing model, referred to as DWOPER (Dynamic Wave Operational model), has been applied along the lower Saint John River. The model, which is representative of the state of the art in unsteady flow modelling, was selected for this application after considering a number of available hydraulic routing techniques. The model accounts for factors such as the downstream effects of the reversing falls and flow over the Trans Canada Highway to large storage areas in the Grand Lake area. Model calibration and verification simulations resulted in a good reproduction of historical flood levels. Subsequently, flood profiles associated with the 1:20 and 1:100 year recurrence interval flood events were determined along the lower Saint John River from McKinley Ferry to Lower Jemseg. (WATDOC)

APPLICATION OF FINITE ELEMENT METHOD IN RIVER NETWORK HYDRAULICS,
Inland Waters Directorate, Burlington (Ontario).
S. M. A. Moin.
In: Proceedings of the Technology Transfer Workshop, Modelling Activities Related to Flood Damage Reductions, Hull, Quebec, May 23-25, 1979. Inland Waters Directorate, Ottawa, Ontario, Canada. Technical Workshop Series No 2, p 163-178, 1980. 8 Fig, 2 Tab, 21 Ref.

Descriptors: *Finite element analysis, Analytical techniques, Mathematics, Flow, Hydraulics, *Numerical analysis, Equations, St. Lawrence River, Parametric hydrology, Open-channel networks, *Flood damage, *Flood control, Canada.

This paper describes a finite element model of the unsteady flow regime in open channel networks. Mathematically, one dimensional unsteady flow hydraulics of open channels is described by a pair of nonlinear, partial differential equations of hyperbolic type and is solved by adopting linear elements. A predictor-corrector method for solving the nonlinear equation is utilized. Simulation capabilities of the computerized model were investigated in determining the steady state profile for the St. Lawrence River. Limited scale sensitivity analysis was conducted to study the influence of the variation of the weighting parameter. A comparison of the model output with the observed events and/or calculated values indicates the suitability of the model from the viewpoints of simulation capabilities, adoption of higher time steps, conservation of mass, flexibility of operations, and handling of complex network configurations. MATHEMATICAL MODELLING OF UNSTEADY FLOWS IN MOBILE BOUNDARY CHANNELS,
Canada Centre for Linland Waters, Burlington (Ontario).
B. G. Krishnappan.
In: Proceedings of the Technology Transfer Workshop, Modelling Activities Related to Flood Damage Reductions, Hull, Quebec, May 23-25, 1979. Inland Waters Directorate, Ottawa, Ontario, Canada. Technical Workshop Series No 2, p 179-197, 1980. 10 Fig, 9 Ref.

Descriptors: *Mathematical models, *Numerical analysis, *Flood control, *Flood forecasting, Unsteady flow, Equations, Sediments, Flood waves, Testing, Water levels, Hydraulics, Bed levels, Model predictions, Detroit River, Rio Vista, California.

A numerical model is described which solves the unsteady flow equations for a mobile boundary channel. This model is capable of predicting the floodwave characteristics as well as the environmental impacts of man's activities in river basins. The model was verified under laboratory conditions, and a reasonably good agreement between

the model predictions and laboratory measurements was observed. (WATDOC)

METEOROLOGICAL INPUTS FOR HYDROLOGICAL MODELS,
Atmospheric Environment Service, Toronto (Ontario). Science Service Div.
R. G. Lawford.
In: Proceedings of the Technology Transfer Workshop, Modelling Activities Related to Flood Damage Reductions, Hull, Quebec, May 23-25, 1979, Inland Waters Directorate, Ottawa, Ontario, Canada, Technical Workshop Series No 2, p 231-244, 1980. 1 Fig, 9 Ref, 1 Append.

Descriptors: *Hydrologic models, *Meteorology, *Flood forecasting, *Warning systems, *Flood control, Networks, Precipitation, Temperature, Weather radar, Satellites, Canada.

Precipitation and temperature are the principal controls of the hydrologic cycle. Historical and real time data are available from Atmospheric Environment Service, and forecasts of precipitation and temperature are available from regional weather centres and from the Canadian meteorological centre. New technologies and their application to hydrologic models are discussed and a brief outline of changes that could be made to the models are suggested to provide more realistic representations of the meteorological processes. Recommendations are made for further improvement of hydrological models and their application to a flood-damage warning system. (WATDOC)

THE NEED FOR A REGIONAL UNIT HYDROGRAPH ANALYSIS OF ONTARIO,
Water Survey of Canada, Ottawa (Ontario).
D. Kimmett.
In: Proceedings of the Technology Transfer Workshop, Modelling Activities Related to Flood Damage Reduction, Hull, Quebec, May 23-25, 1979. Inland Waters Directorate, Ottawa, Ontario, Canada, Technical Workshop Series No 2, p 245-264, 1980. 5 Fig.

Descriptors: *Hydrograph analysis, *Flood forecasting, Water resources, Unit hydrographs, Model studies, Conservation authorities, *Flood damage, *Flood control, Canada.

Many of the credibility problems associated with past hydrologic studies are related to the fact that each individual has a different understanding of unit hydrograph theory and how it is best applied. It is proposed that Water Survey of Canada develop the necessary in-house expertise and publish unit hydrograph(s) on a continuing as required basis for appropriate hydrometric stations. Recent technological advancements, the need for standards in hydrology generally, and the availability of sufficient data are further incentives for initiating such a program at this time. An informal canvass of several data users drew favorable responses to the concept. A conceptual look at what should be published is provided. (WATDOC)

RUNOFF FROM DEVELOPING AREAS,
Canada Centre for Inland Waters, Burlington (Ontario).
J. Marsalek.
In: Proceedings of the Technology Transfer Workshop, Modelling Activities Related to Flood Damage Reduction, Hull, Quebec, May 23-25, 1979. Inland Waters Directorate, Ottawa, Ontario, Canada, Technical workshop Series No 2, p 265-276, 1980. 1 Fig, 1 Tab, 14 Ref.

Descriptors: *Hydrologic models, *Runoff, *Floods, Rainfall, Hydrology, *Watersheds(Basins), *Flood control, *Hydrometeorology, Infiltration, Flood damage, Water loss, Simulation analysis, Calibration - Varification data, Canada.

Runoff from developing areas is of particular interest in connection with flood modelling because the land development dramatically alters the watershed hydrological response. During the past 15 years, a number of models for modelling of runoff from development and refinement of these models is currently underway with particular reference to the assessment of the effects of urbanization on the watershed hydrological regimen, modelling of infiltration, and modelling of flood damages. FLOOD FORECASTING IN THE SAINT JOHN RIVER BASIN - MATHEMATICAL MODELLING ACTIVITIES,
Inland Waters Directorate, Halifax (Nova Scotia).
D. A. Smith.
In: Proceedings of the Technology Transfer Workshop, Modelling Activities Related to Flood Damage Reduction, Hull, Quebec, May 23-25, 1979. Inland Waters Directorate, Ottawa, Ontario, Canada. Technical Workshop Series No 2, p 277-311, 1980. 5 Fig, 1 Tab, 11 Ref.

Descriptors: *Flood forecasting, *Mathematical models, *Snowmelt, *Streamflows, Hydrologic data, Meteorology, Synthesis, River routing, Flood damage, Saint John River, Canada.

The development of a flood forecasting system for the portion of the Saint John River basin in the province of New Brunswick is reviewed. The paper progresses, in chronological order, from the time when there was no forecasting system, through the first efforts to calibrate the SSARR model for the basin and the forecasting operations during the 1973 record historic flood to the present. Emphasis is placed on the mathematical modelling activities and on recent efforts to improve the forecasting system being carried out under the Canada - New Brunswick flood damage reduction program. The major concerns of the technical subcommittee for flood forecasting are presented, and the activities presently underway, or planned, to overcome some of these difficulties are discussed. (WATDOC)

OTTAWA RIVER - COMPARISON OF THE HYDRO QUEBEC AND SSARR MODELS,
Inland Waters Directorate, Ottawa (Ontario).
G. E. Brown.
In: Proceedings of the Technology Transfer Workshop, Modelling Activities Related to Flood Damage Reduction, Hull, Quebec, May 23-25, 1979. Inland Waters Directorate, Ottawa, Ontario, Canada, Technical Workshop Series No 2, p 320-330, 1980. 2 Tab.

Descriptors: *Flood forecasting, *Flood control, *Hydrometric models, *Watersheds(Basins), Mathematics, Equations, Streamflow discharges, Snowmelt, Model calibration, Performance, Canada.

An analysis of the forecasted watershed and streamflow discharge results for five Ottawa River basin watersheds was undertaken to compare the Hydro Quebec and SSARR natural inflow models. The Hydro Quebec model generally out-performed the SSARR model for these five particular watersheds. With respect to 10 day forecast results there was a noticeable deterioration in the SSARR model results, whereas the Hydro Quebec model showed a marginal deterioration from each day to the next of the forecast period. It is pointed out that the Hydro Quebec model was designed for relatively large watersheds calibrated to moving 7 day mean daily inflows for reservoirs at the extremity of each basin. Thus, performance of the Hydro Quebec model is uncertain for hydrometrically gauged watersheds, since the five watersheds in question were calibrated to computed reservoir inflow data. (WATDOC)

SHORT-TERM AND LONG-TERM HYDROMETEOROLOGICAL EPOCHS,
Inland Waters Directorate, Calgary (Alberta).
W. Nemanishan.
In: Proceedings of the Technology Transfer Workshop, Modelling Activities Related to Flood Damage Reduction, Hull, Quebec, May 23-25, 1979. Inland Waters Directorate, Ottawa, Ontario, Canada, Technical Workshop Series No 2, p 331-341, 1980. 10 Fig, 17 Ref.

Descriptors: *Flood forecasting, Runoff, Model studies, *Hydrometeorology, Sea surface, Temperatures, *Flood control, Droughts, South Saskatchewan River, Equations, Hydrology, Streamflow, Canada.

Scientific evidence is becoming stronger to indicate that extraterrestrial factors, such as solar activity and lunar cycles, influence atmospheric and oceanic circulation which then combine to produce prolonged droughts or floods in specific locations of the northern hemisphere. The studies of several prominent world scientists are highlighted to show how their findings can be used to improve Inland Waters Directorate studies of western Canadian flood problems. A case history is presented to illustrate the difficulty of assigning correct return periods for rare flood events and the valuable contribution that runoff modelling can make in these cases. THE THREE PARAMETER LOGNORMAL DISTRIBUTION APPLIED TO REGIONAL FLOOD FREQUENCY ANALYSIS BY THE INDEX FLOOD METHOD,
Inland Waters Directorate, Ottawa (Ontario).
R. Condie.
In: Proceedings of the Technology Transfer Workshop, Modelling Activties Related to Flood Damage Reduction, Hull, Quebec, May 13-25, 1979, Inland Waters Directorate, Ottawa, Ontario, Canada. Technical Workshop Series No 2, p 345-353, 1980. 3 Tab, 4 Ref.

Descriptors: *Flood frequency, Maximum probable floods, Homogeneity tests, Regression analysis, Equations, Parametric hydrology, Annual flood, Regionalization, Canada.

Regional flood frequency analysis by the index flood method is in fairly common use when estimates of flood flows of specific probabilities are required at ungauged river sites. Use of this method usually assumes that the Gumbel 1 distribution gives a fair representation of the flood frequency regime throughout a homogeneous region, and the most commonly used homogeneity test is

based on sampling from that distribution. Some reservations have arisen regarding the adequacy of the Gumbel 1 distribution, but use of other distributions may have been inhabited by lack of appropriate homogeneity tests. The three parameter lognormal distribution is generally superior to the Gumbel 1 in Canada. Reasons for this choice are given and the derivation of a homogeneity test is described. Advantages and disadvantages of the index flood method are also discussed in relation to the method of direction regression on the T-year flood. (WATDOC)

FLOOD FREQUENCIES BY THE KINEMATIC WAVE MODEL,
Inland Waters Directorate, Vancouver (British Columbia).
R. O. Lyons.
In: Proceedings of the Technology Transfer. Workshop, Modelling Activities Related to Flood Damage Reduction, Hull, Quebec, May 23-25, 1979. Inland Waters Directorate, Ottawa, Ontario, Canada, Technical Workshop Series No 2, p 354-368, 1980. 1 Tab, 7 Ref.

Descriptors: *Flood frequency, *Design flood, *Mathematicl models, Mathematics, *Equations, Probability, Peak discharge, Rainfall intensity, Computation, Parametric hydrology, Runoff, Meteorology, Topography, Canada.

The kinematic wave model was used by Inland Waters Directorate, Pacific and Yukon Region, as one of several methods to estimate design floods for the Alaska Highway Pipeline Investigation. This paper briefly describes the basic equations forming the model and discusses the way the model was caglibrated for the southern Yukon. The model gives a convenient method for directly estimating flood frequencies at ungauged basins. A fairly large effort in analysis of meteorological data is required, but once this is done, frequency curves can be developed quickly, cheaply, and directly. (WATDOC)

FLOOD FREQUENCY ANALYSIS BY POWER TRANSFORMATION,
Water Survey of Canada, Vancouver (British Columbia).
R. S. McAully.
In: Proceedings of the Technology Transfer Workshop, Modelling Activities Related to Flood Damage Reduction, Hull, Quebec, May 23-25, 1979. Inland Waters Directorate, Ottawa, Ontario, Canada, Technical Workshop Series No 2, p 369-382, 1980. 1 Fig, 5 Tab.

Descriptors: *Flood frequency, *Computer programs, Power transformation method, Peak discharge, Streams, Ash River, *Model studies, Equations, Canada.

This paper describes a technique for flood frequency analysis by fitting the normal probability distribution to an annual flood series after applying what has been called a power transformation. The computer program to implement this power transformation is described and some results from analyzing 35 streams in British Columbia are presented. The power transformation method, which is very easy to apply, generally gave excellent agreement with the established log-Pearson III method. (WATDOC)

A FLEXIBLE FAMILY OF STACHASTIC MODELS,
Waterloo Univ. (Ontario). Dept. of System Design.
K. W. Hipel.
In: Proceedings of the Technology Transfer Workshop, Modelling Activities Related to Flood Damage Reduction, Hull, Quebec, May 23-25, 1979, Inland Waters Directorate, Ottawa, Ontario, Canada, Technical Workshop Series No 2, p 422-431, 1980. 1 Tab, 18 Ref.

Descriptors: *Stochastic processes, *Flood forecasting, *Statistical models, *Synthetic hydrology, Time series analysis, Mathematics, Intervention analysis, River flow data, Spring runoff, Forest fire model, Canada.

The family of Box-Jenkins models, and other closely related stochastic models, form a group which can be used to help solve many types of problems which arise in hydrology. A model which is of particular importance in hydrology is the intervention model. This model can be employed to determine the effects of man induced or natural interventions upon the mean level of a time series, to fill in missing observations in a time series, and to answer other kinds of similar problems. Following a description of the intervention model, it is explained how the most appropriate type of intervention model can be selected to fit to a specific data set by adhering to the identification, estimation, and diagnostic check stages of model development. A number of examples confirm the importance of this model for modelling Canadian hydrological data. (WATDOC)

HYDROLOGIC EXTREME VALUE MODEL AND RISK ANALYSIS APPLIED TO FLOOD PLAIN MANAGEMENT,
Ecole Polytechnique, Montreal (Quebec). Dept. of Civil Engineering.
F. Ashkar, N. El-Jabi, and J. Rouselle.
In: Proceedings of the Technology Transfer Workshop, Modelling Activitis Related to Flood Damage Reduction, Hull, Quebec, May 23-25, 1979. Inland Waters Directorate, Ottawa, Ontario, Canada, Technical Workshop Series No 2, p 432-446, 1980. 5 Fig, 5 Ref.

Descriptors: *Flood plains, *Flood plain insurance, *Zoning, Protection, Control, Mathematical models, Stachastic processes, Time series analysis, Statistical methods, Parametric hydrology, Equations, Canada.

Rational planning of flood plains may be undertaken by separating them into different zones to control their development, and basing insurance premiums on flood damage risk for each zone. The risk may be established from the relationship between the return period, or the occurrence of a given flood, and the flood level. A mathematical model based on the extreme values theory in stachastic processes has been established where the distribution function of these maximum exceedances in an interval of time (O,t) could be found. Bayesian and maximum likelihood approaches are followed in order to find the distribution function of the exceedance for a given return period when uncertainty arises in the parameters of the distribution function describing the model. The risks encountered in evaluating this exceedance using different lengths of period of record are compared. (WATDOC)

HYDRO CONFIGURATION MODELLING SYSTEM,
Inland Waters Directorate, Ottawa (Ontario).
D. W. Farley.
In: Proceedings of the Technology Transfer Workshop, Modelling Activities Related to Flood Damage Reduction, Hull, Quebec, May 23-25, 1979. Inland Waters Directorate, Ottawa, Ontario, Canada, Technical Workshop Series No 2, p 447-455, 1980. 2 Fig, 5 Ref

Descriptors: *Model studies, *Flood control, *Linear programming, *Time series analysis, Stochastic processes, Synthetic hydrology, Dynamic programming, Reservoir operation, Mathematics, Continuity equations, Canada.

A generalized modelling package referred to as HCMS (hydro Co-figuration Modelling System) has been developed for studying multi-reservoir river systems. The package is particularly applicable to basins in which there is an existing hydroelectric generating capacity and/or a potential for further development. The package is used to evaluate proposals relating to: increased reservoir storage devoted to flood protection; new reservoirs; new installed turbine capacity; environmental requirements in terms of constrained reservoir levels or minimum flows; diversions of flow; and increased channel discharge capacity. By comparing the results of different simulated operation policies and configurations with each other and with historical performance, the planning team can readily assess the impact on flood protection, energy production, and environmental concerns. In order to expedite the modelling phase of studies, the package is endowed with a realistic optimal seeking solution routine. This optimal seeking solution routine employs a linear programming sub-routine, available from the IBM package SL-Math. As opposed to other applications of linear programming to water resource systems studies, the optimal seeking solution routine of this model does not assume perfect hindsight of time series data, nor is it restricted to critical periods of record to conform with dimensionality requirements common to other optimization models. A PROCEDURE FOR DETERMINING FLOOD FREQUENCIES FOR GREAT LAKES SHORELIN E,
Inland Waters Directorate, Burlington (Ontario).
D. W. Brown, R. J. Moulton, and S. M. A. Moin.
In: Proceedings of the Technology Transfer Workshop Modelling Activities Related to Flood Damage Reduction, Hull, Quebec, May 23-25, 1979. Inland Waters Directorate, Ottawa, Ontario, Canada, Technical Workshop Series No 2, p 456-465, 1980. 2 Fig, 4 Ref.

Descriptors: *Flood frequency, *Flood forecasting, *Model studies, Flood control, Climatology, Peak discharge, Winds, Waves, Mathematical studies, Equations.

Procedures are presented which can be used to determine flood frequencies on the Great Lakes The procedure varies according to the availability of data. The procedure is relatively simple near gauges where there are records of peak flood levels. If such data is not available, the procedure becomes more complex, as the flood frequencies must be derived by calculating wind set-up and run-up distributions from climatologic data and combining these frequency distributions with mean water level frequency distribution for the lake. WATER LEVELS IN ARTESIAN AND NONARTESIAN AQUIFERS OF FLORIDA, 1977-78,
Geological Survey, Tallahasses, FL. Water Resources Div.
H. G. Healy.
Denver, CO. 80225. Paper copy $13.50, microfiche $3.50. Geological Survey Open-File Report 80-693, 1980. 99 p, 54 Fig, 1 Tab, 10 Ref.

Descriptors: *Groundwater resources, *Water levels, *Florida, *Aquifer characteristics, *Drawdown, Pumping, Observation wells, Groundwater recharge, Water level fluctuations, Hydrographs.

During 1977 and 1978, water levels in the Floridan aquifer throughout most of north and central peninsular Florida rose 1 to 3 feet, based on water levels measured in 380 wells selected from a network of about 5,000 observation wells for which measurements are in the files of the U.S. Geological Survey. Hydrographs of 51 wells are presented which show long-term trends of ground-water levels in selected areas of Florida. In west-central Polk County, an area of notable pumping, levels in the Floridan and other aquifers rose in response to decreased pumping of ground water for industrial use. In north Florida, levels rose from 1 to about 4 feet in Suwannee and Hamilton Counties. In northwest Florida, levels in the sand-and-gravel aquifer rose from less than 1 foot to 5 feet. Most widespread declines in ground-water levels in northwest Florida occurred in the Tallahassee area where levels declined from 1 to nearly 5 feet. (USGS)

THE SURFICIAL AQUIFER AT THE U.S. NAVAL STATION NEAR MAYPORT, FLORIDA,
Geological Survey, Tallahassee, FL. Water Resources Div.
B. J. Franks.
Denver, CO. 80225. Paper copy $2.00, microfiche $3.50. Geological Survey Open-File Report 80-765, 1980. 13 p, 3 Fig, 2 Tab, 8 Ref.

Descriptors: *Unconsolidated aquifers, *Aquifer characteristics, *Groundwater, *Water quality, *Shallow wells, *Florida, Potential water supply, Water table, Water wells, Test wells, Brackish water, Transmissivity, Water yield, Water utilization, Water chemistry, Heat exchangers, Hydrogeology, Evaluation, *Duval County(FL).

The surficial aquifer at the U.S. Naval Station near Mayport, Florida, consists of about 70 feet of unconsolidated sand, shell, and clay. The principal water-bearing zone is a shell bed 35 to 55 feet below land surface. The aquifer is unconfined, and the water table was about 4 feet below land surface during the investigation (spring 1979). Aquifer tests indicate a transmissivity for the aquifer of approximately 2,400 feet squared per day. Water in the upper 40 feet of the aquifer is fresh, but becomes increasingly brackish with depth. Use of water from the surficial aquifer is limited because of low yields and poor water quality. Feasibility of injection of return cooling water into the surficial aquifer is limited by the shallow water table. (USGS)

POTENTIOMETRIC MAP OF THE COFFEE SAND AQUIFER IN NORTHEASTERN MISSISSIPPI, OCTOBER AND NOVEMBER 1978,
Geological Survey, Jackson, MS. Water Resources Div.
B. E. Wasson.
Available from OFSS, USGS, Box 25425, Fed. Ctr., Denver, CO. 80225, Paper copy $2.50, microfiche $0.50. Geological Survey Open-File Report 79-1587 (WRI), 1980. 1 Sheet, 7 Ref.

Descriptors: *Maps, *Potentiometric level, *Aquifers, *Groundwater, *Mississippi, Water resources, Natural recharge, Observation wells, Water level fluctuations, Hydrogeology, Hydrographs, *Coffee Sand aquifer(MS).

This potentiometric map of the Coffee Sand aquifer in northeastern Mississippi is the fourth in a series of maps, prepared by the U.S. Geological Survey in cooperation with the Mississippi Department of Natural Resources, Bureau of Land and Water Resources, delineating the potentiometric surfaces of the major aquifers in Mississippi. In the outcrop areas the potentiometric surface is strongly affected by recharge from precipitation, topography, and drainage of the aquifer by streams. The potentiometric surface slopes generally to the west away from the area of outcrop and is mildly affected by moderate ground-water withdrawals by wells in Tippah and Union County. Historically, water levels in or near the outcrop of the Coffee Sand have shown little or no long-term changes as shown by a hydrograph of one well in Alcorn County. In the downdip part of the aquifer water-level declines of 2 feet per year are common. (USGS)

POTENTIOMETRIC MAP OF THE EUTAW-MC SHAN AQUIFER IN NORTHEASTERN MISSISSIPPI, SEPTEMBER, OCTOBER, AND NOVEMBER 1978,
Geological Survey, Jackson, MS. Water Resources Div.
B. E. Wasson.
Available from OFSS, USGS, Box 25425, Fed. Ctr., Denver, CO. 80225. Paper copy $2.50, microfiche $0.50. Geological Survey Open-File Repot 79-1584 (WRI), 1980. 1 Sheet, 9 Ref.

Descriptors: *Maps, *Potentiometric level, *Aquifers, *Groundwater, *Mississippi, Water resources, Natural recharge, Observation wells, Water level fluctuations, Hydrogeology, Hydrographs, *Eutah-McShan aquifer(MS).

This potentiometric map of the Eutaw-McShan aquifer in northeastern Mississippi is the third in a series of maps, prepared by the U.S. Geological Survey in cooperation with the Mississippi Department of Natural Resources, Bureau of Land and Water Resources, delineating the potentiometric surfaces of the major aquifers in Mississippi. From its outcrop area the Eutaw-McShan aquifer dips about 30 feet per mile to the west and southwest. Thickness of the aquifer commonly is between 200 and 300 feet in most of the area, and commonly about one-half this thickness consists of sand. In the outcrop area the potentiometric surface is strongly affected by recharge from precipitation, topography, and drainage of the aquifer by streams. The potentiometric surface of the aquifer slopes generally to the west away from the area of outcrop and it is strongly affected by large groundwater withdrawals at or near Tupelo, Aberdeen, and West Point. Historically, water levels in or near the outcrop of the Eutaw-McShan aquifer have shown little or no long-term changes. Withdrawals of water by wells from the downdip area have caused long-term water-level declines of 1 to 2 feet per year in much of the confined part of the aquifer. Water-level declines during recent years in several observation wells in Lee County ranged from 2 to 9 feet per year. One hydrograph in Clay County that is near the center of the depression in the potentiometric surface at West Point shows about 5 feet per year of water-level decline since 1972. (USGS)
W81-00357

POTENTIOMETRIC MAP OF THE RIPLEY AQUIFER IN NORTHEASTERN MISSISSIPPI, OCTOBER AND NOVEMBER 1978,
Geological Survey, Jackson, MS. Water Resources Div.
B. E. Wasson.
Available from OFSS, USGS, Box 25425, Fed. Ctr., Denver, CO. 80225, Paper copy $2.50, microfiche $0.50. Geological Survey Open-File Report 79-1585 (WRI), 1980. 1 Sheet, 5 Ref.

Descriptors: *Maps, *Potentiometric level, *Aquifers, *Groundwater, *Mississippi, Water resources, Natural recharge, Observation wells, Water level fluctuations, Hydrogeology, Hydrographs, *Ripley aquifer(MS).

This potentiometric map of the Ripley aquifer in northeastern Mississippi is the fifth in a series of maps, prepared by the U.S. Geological Survey in cooperation with the Mississippi Department of Natural Resources, Bureau of Land and Water Resources, delineating the potentiometric surfaces of the major aquifers in Mississippi. In the outcrop area of the Ripley aquifer the potentiometric surface is strongly affected by recharge from precipitation, by topography, and by drainage of the aquifer by streams. The potentiometric surface slopes generally to the west away from the area of outcrop and is mildly affected by pumpage from wells and by discharge of flowing wells in the valleys. Historically, water levels in or near the outcrop have shown little or no long-term changes. (USGS)

Descriptors: *Maps, *Potentiometric level, *Aquifers, *Groundwater, *Mississippi, Water resources, Natural recharge, Observation wells, Water level fluctuations, Hydrogeology, Hydrographs, *Gordo aquifer(MS).

This potentiometric map of the Gordo aquifer in northeastern Mississippi is the second in a series of maps, prepared by the U.S. Geological Survey in cooperation with the Mississippi Department of Natural Resources, Bureau of Land and Water Resources, delineating the potentiometric surfaces of the major aquifers in Mississippi. The potentiometric surface of the Gordo aquifer slopes generally to the west away from the outcrop area and it is depressed generally by large ground-water withdrawals in the Tupelo and Columbus areas. Historically, water levels in or near the outcrop of the Gordo aquifer have shown little or no long-term changes. Heavy withdrawals from the downdip area have caused long-term water-level declines of 1 to 2 feet per year in much of the confined part of the aquifer. Water-level decline in one observation well in Tupelo has averaged about 5 feet per year since 1966. (USGS)

AN INSTRUMENTED LYSIMETER SYSTEM FOR MONITORING SALT AND WATER MOVEMENT,
Science and Education Administration. Kimberly,

ID. Snake River Conservation Research Center.
C. W. Robbins, and L. S. Willardson.
Transactions of the American Society of Agricultural Engineers, Vol 23, No 1, p 109-111, January-February 1980. 4 Fig, 7 Ref. OWRT-B-148-UTAH(2), 14-34-0001-7195.

Descriptors: *Lysimeters, *Equipment, *Soil water movement, *Salinity, Laboratory equipment, Instrumentation, Design, Construction, Salts, Weight, Conductivity, Soils, Soil science.

A lysimeter system was described that consists of four continuously weighing lysimeters mounted on a portable platform. The lysimeters, made from low pressure PVC irrigation pipe (1.18 m deep by 0.31 m dia), are placed on a hydraulic weighing system that consists of either a water-filled rubber pillow or an automotive innertube connected to a water column. The sensitivity of the weighing system is 0.1 kg or an equivalent water depth of 1.4 mm. One-bar ceramic cups, placed in the center of the lysimeters at 0.25, 0.50, and 0.75 m from the soil surface, are connected to the outside for soil solution sampling. Eight small bolts symmetrically located around the lysimeter at the same depths as the ceramic cups serve as 'four probe' contacts for electrical conductivity measurements. The cost of each set of four lysimeters in 1978 was about $400. (Sims-ISWS)

INFLUENCE OF SIZE OF GYPSUM PARTICLES ON THE HYDRAULIC CONDUCTIVITY OF SOILS,
Volcani Inst. of Agricultural Research, Bet-Dagan (Israel). Inst. of Soil and Water.
R. Keren, J. F. Kreit, and I. Shainberg.
Soil Science, Vol 130, No 3, p 113-117, September, 1980. 3 Fig, 1 Tab, 6 Ref.

Descriptors: *Hydraulic conductivity, *Gypsum, *Soil types, Particle size, Loam, Foreign research, Calcium compounds, Hydrology, Pores, Soil physical properties, Leaching.

The influence of gypsum fragments and content on the hydraulic conductivity of soils before the gypsum has dissolved was studied in a loamy soil and a sandy loam soil, both from the coastal plain of Israel. The soils were mixed with gypsum to bring the gypsum content to 1, 5, or 10% of the sample. Two ranges of particle sizes were used: less than 44 micrometers or 0.25-1.0 mm in diameter. Soils were packed into columns, covered with quartz sand, flushed with carbon dioxide and subsequently wetted from the top by flooding the surface with 0.0025 M CaC12 solution in air-free water. The hydraulic conductivity of the soils increased with the dissolution of gypsum from the column. The initial relative hydraulic conductivity in both soils containing 5 and 10% gypsum decreased to 35 and 20%, respectively. The loam soil was more sensitive to gypsum content. Large pores in the sandy loam soil more easily accommodated the gypsum fragments without a drop in the hydraulic conductivity. As the content of gypsum increased, the difference between the soils disappeared. When mixed with the larger fragments of gypsum, the hydraulic conductivity of both soils was almost unaffected, suggesting that the effect of the gypsum particle is mainly physical and the decrease in initial hydraulic conductivity was due to plugging of the soil pores with gypsum particles. SALINITY EFFECTS ON HYDRAULIC PROPERTIES OF SOILS,
New Mexico State Univ., Las Cruces. Dept. of Agronomy.
C. S. Park, and G. A. O'Connor.
Soil Science, Vol 130, No 3, p 167-174, September, 1980. 6 Fig, 3 Tab, 15 Ref.

Descriptors: *Groundwater movement, *Salinity, *Hydraulic conductivity, *Soil texture, Permeability, Porosity, Soil physical properties, Sands, Clays, Rain water, Water types, Saturated flow, Hydrology, Physical properties.

Four soils ranging from sand to clay were used to study saturated hydraulic conductivity (HC) and infilitration rates with five saline-sodic waters representative of the saline groundwaters in New Mexico. The waters contained dissolved solids in amounts ranging from 1,250 to 15,000 mg/liter. SAR values ranged from 16 to 57. Water quality did not significantly affect the saturated soil HC as long as these waters remained the sole source of irrigation water. Swelling was kept to a minimum so long as the electrolyte concentration remained above the threshold value. The passage of 1 pore volume of high quality water, representative of rain water, through the test soils caused a significant reduction in saturated HC. In Sheppard sand, HC values at 1 pore volume of drainage were reduced by 25-35%. Very sandy soils were the least affected. As this decrease was not reversible, it was thought that dispersion, rather than swelling, was responsible for the decreased HC. Swelling was an important mechanism only in clay soils. It was concluded that, where saline-sodic water is the dominant source of irrigation and is supplemented by rains, all combinations of saline-sodic water could be used on very sandy soils, while no saline-sodic waters should be used on fine-textured soils, and only slightly sodic waters would be successful on medium-textured soils. 2H. Lakes

OCCURRENCE AND REGULATORY ROLE OF CYCLIC ADENOSINE MONOPHOSPHATE IN THE NUTRIENT DYNAMICS OF CONTROLLED AND NATURAL COMMUNITIES OF LAKES,
Michigan State Univ., Hickory Corners. W. K Kellogg Gull Lake Labs.
R. G. Wetzel, and D. A. Francko.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-120586. Price codes: A04 in paper copy, A01 in microfiche Institute of Water Research, Michigan State University, Project Completion Report. October, 1980. 51 p, 16 Fig, 9 Tab. OWRT A-103-MICH(1), 14-34-0001-9024, 0124.

Descriptors: *Algae, Macrophytes, Cyanophyta, Nitrogen, *Nutrients, *Phosphorus, Nutrient limitations, *Lakes, Phytoplankton, Alkaline phosphatase activity, Chlorophyll, Phosphates, *Adenosine monophosphate.

Cyclic adenosine 3':5'-monophosphate (cAMP) was found in both cellular and dissolved forms in cultures of several species of green and blue-green algae. Quantities of both cellular and dissolved cAMP varied interspecifically under similar culture conditions and intraspecifically under differing culture conditions and at different stages of cell growth. Similar quantities of tissue and filtrate cAMP were found in several species of aquatic vascular plants and aquatic bacteria. In the epilimnia and littoral zones of two trophically dissimilar aquatic systems, cAMP was found in both particulate-associated and dissolved phases in lakewater samples. Both cAMP fractions varied greatly in concentration both seasonally and between the lakes. Particulate cAMP levels were largely due to algal cAMP content, while dissolved cAMP in epilimnetic and littoral lakewater samples resulted from combined release by algae, aquatic macrophytes, bacteria and other autochthonous sources. Most of the total cAMP was found in the dissolved phase during all times of the year. Cellular cAMP levels in the blue-green alga Anabaena flos-aquae were enhanced upon inoculation into N-free, but not P-free media. Cellular cAMP levels also increased upon inoculation into fresh media containing non-limiting nutrient concentrations. Cellular cAMP levels in Anabaena were exponentially correlated with 14C-bicarbonate uptake. In oligotrophic Lawrence Lake, particulate cAMP levels were linearly correlated to 14C-primary productivity rates in the epilimnion on a seasonal basis. In Lawrence Lake and hypereutrophic Wintergreen Lake, particulate cAMP levels in certain phytoplankton associations were linearly correlated to alkaline phosphatase specific activity and chlorophyll a content. Cyclical changes in particulate and dissolved cAMP levels corresponded to changes in phytoplankton abundance and community composition

STRATIFIED BIDIRECTIONAL SEEPAGE FLOW THROUGH AN EARTHEN EMBANKMENT,
Lowe (Roger) Associates, Inc., Bellevue, WA.
J. T. Cameron, C. T. Kincaid, and G. Z. Watters
In: Finite Elements in Water Resources, Volume 1; Preprints of the Third International Conference (2 Vol), Mississippi University, Oxford, May 19-23m 1980. p 2.127-2.136, 1980. 10 Fig, 1 Tab, 4 Ref. Science and Education Administration, New Orleans, Louisiana. OWRT B-139-UTAH(9), 14-34-0001-7191.

Descriptors: *Seepage, *Embankments, *Great Salt Lake, *Model studies, Saline water-freshwater interfaces, Mathematical models, Analytical techniques, Groundwater movement, Porous media, Lakes, Salinity, Density, Pressure, Hydraulic conductivity, Interfaces, Stratification, Stratified flow, Causeways.

From the early years of this century until 1959, Great Salt Lake West of Promontory was spanned by the Southern Pacific Railroad on a wooden trestle. For reasons of maintenance and vulnerability to fire, an earthen causeway was constructed replacing the 12-mile long trestle. Originally designed to permit a free exchange of salt brines between the northern and southern bodies of water, the embankment presently restricts the flows. Since freshwater recharge to this terminal lake predominantly enters the southern arm, an elevation gradient drives a northward flow through the upper zone of the causeway. The greater salinity concentrations which have evolved in the northern arm have given rise to a density gradient which drives a southward flow through the lower zone of the causeway embankment. The objective of this study was the numerical simulation of this stratified bidirectional seepage flow through the earthen embankment. Specifically, a two-dimensional finite element model of stratified flow in porous media was developed. Discharges, free surface and interface locations were predicted as functions of fluid densities and lake surface and interface elevations. (See also W80-06858) (Sims-ISWS)

LAKE SAMMAMISH RESPONSE TO WASTEWATER FIVERSION AND INCREASING URBAN RUNOFF,
Washington Univ., Seattle. Dept. of Civil Engineering.
E. B Welch, C. A. Rock, R. C. Howe, and M. A Perkins.
Water Research, Vol 14, No 7, p 821-828, 1980. 3 Fig, 2 Tab, 19 Ref. OWRT-B-068-WASH(2). EPA R-800512.

Descriptors: *Lakes, *Water pollution sources, Watersheds(Basins), *Washington, Storm runoff, Urban runoff, Waste water disposal, *Phosphorus, Diversion, On-site investigations, Data collctions, Analysis, *Phytoplankton, Water quality, Sampling, Algae, Cyanophytes, *Lake Sammamish(WA)

Lake Sammamish has shown a decrease in its mean annual concentration of phosphorus following diversion of about one-third of the external loading in 1968. During 1971-1975 the P concentration averaged 27 micrograms/l, in contrast to the prediversion (1964-1966) concentration of 33 micrograms/1, and may be equilibrating near the predicted steady-state concentration of 22 micrograms/l. Neither phytoplankton biomass or Secchi

visibility has changed following diversion; however, the blue-green component of the phytoplankton decreased by nearly 50%. The failure of biomass and visibility to improve is probably a result of similar pre- and postdiverson winter-spring epilimnetic P concentrations. The marked reduction in P since diversion occurred during and prior to fall overturn and may have represented a supply or P for later summer early fall blue-green algal populations that declined after diversion. Runoff from a rapidly developing westside portion (18%) of the watershed is contributing substantially to P loading of the lake. Development to a density of about ten dwellings/ha has increased loadin possibly on the order of 14%. Future development of the eastside portion (26% of watershed) may increase loading by 20% and be equivalent to nearly one-half of the P previously diverted in 1968. (Humphreys-ISWS)

ENHANCEMENT OF RELEASE WATER QUALITY BY LOCALIZED MIXING LAKE OKATIBBEE, MS,
Army Engineer Waterways Experiment Station, Vicksburg, MS.
S. C. Wilhelms.
In: Proceedings, 14th Annual Mississippi Water Resources Conference, 24-25, September 1979. p 97-100 (1979) 4 Fig, 1 Tab.

Descriptors: *Stratification, *Water quality, *Garton pump, *Discharge(Water), Dissolved oxygen, Hypolimnion, Epilimnion, Thermal stratification, Mixing, Destratification, Turbulence, Pumping, Water circulation.

A low-energy mechanical pump, the Garton pump, was used to demonstrate that localized mixing near a fixed low-level outlet will enhance the quality of low flow releases by mixing water from the epilimnion with water from the hypolimnion. Thermal stratification can result in a hypolimnion with zero dissolved oxygen and high levels of hydrogen sulfide, iron, and manganese. Release of such low quality water without mixing can result in poor water quality downstream,Lake Okatibbee, near Meridian, Mississippi, was used for the demonstration. It is a shallow lake with a fixed low-level intake, a horseshoe-shaped conduit, and a stilling basin. The Garton pump was attached to the upstream face of intake structure to pump water from the surface toward the bottom. A Hydrolab Surveyor Model 6D Water Quality Analyzer and a Yellow Springs Instrument (YSI) D. O.-Temperature meter were used along with titration to take water quality measurements. Results show a definite improvement in released water quality where the fan is used. Approximately 50% of the outlet fow was estimated to be epilimnion water. Important design factors include the relationship between discharge rate and release rate, pump thrust, and pump discharge penetration depth. (See also W81-00290) (Seigler-IPA)

A TROPHIC CLASSIFICATION OF MINNESOTA LAKES BASED ON LAKE SEDIMENTS,
Minnesota Univ., Minneapolis. Limnological Research Center.
H. E. Wright, Jr.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-124141, Price codes: A02 in paper copy, A01 in microfiche. Completion Report, July, 1980. 20 p, 4 Fig, 1 Tab, 22 Ref. OWRT-B-128-MINN(1), 14-34-0001-7164.

Descriptors: *Minnesota, *Lake morphology, *Lake sediments, *Diatoms, *Bioindicators, Correlation analysis, Sampling bodies of water, Lakes, Lake beds, Microorganisms, Aquatic life, Microbiology, Water sampling, Assay, Statistical methods, Chemical analysis, Ecological distribution, Sediment, Diatomaceous earth, Bottom sediments, Water chemistry, Eutrophication.

The lakes sampled were selected to be representative of the wide variety of Minnesota lake types. Sediments were sampled in each of 105 lakes in the deepest water. The surface sediment samples were analyzed for diatoms, and water samples from the same lakes were chemically analyzed. Correlation between the two series by cluster analysis provided the ecological basis for the use of diatom assemblages to classify lakes. Deep oligotrophic lakes were characterized by Cyclotella comta; dilute acid lakes were characterized by Melosira distans, Meloshira italica, Tabellaria fenestrata, Cyclotella stelligera, and Cyclotella glomerata; and highly entrophic lakes were characterized by Stephanodiscus hantzschii. Diatom analysis of lake sediment cores could then be used to reconstruct past lake conditions, and thus evaluate the changes in lake trophic status as a result of pollution and changes induced by natural climatic and hydrologic factors. The results showed that Stephanodiscus hantzschii was a consistent indicator of cultural eutrophication. (Zielinski-IPA)

DIFFERENTIAL C02 AND 02 BENTHIC COMMUNITY METABOLISM IN A SOFT-WATER LAKE,
Connecticut Univ., Storrs. Biological Sciences Group.
P. H. Rich.
Journal of the Fisheries Research Board of Canada, Vol 36, No 11, p 1377-1389, 1979. 8 Fig, 5 Tab, 51 Ref. OWRT-A-071-CONN(4), 14-31-0007-6007.

Descriptors: *Respiratory quotients, *Carbon dioxide, *Dissolved oxygen, Biochemical oxygen demand, Oxygen demand, Photosynthesis, Cyanophyta, Anaerobic conditions, *Lakes, Aerobic conditions, Stratification, Metabolism, Respiration, Connecticut, Dunham Pond(CT).

Respiratory quotients (RQ = C02 released/02 taken up) were examined for Dunham Pond, a small, softwater lake in the eastern Paleozoic highlands of Connecticut. Samples were taken weekly or every two weeks from January 1973 to April 1976 at stations located centrally, at the inlet streams, and at the outlet. Light meaurements were made with a cadmium sulfide cell and Secchi disk. Measurements of temperature, conductivity, dissolved oxygen, dissolved carbon dioxide, and chemcal oxygen demand were also made. Surface sediment samples were taken at 3.5 m with a free-fall core sampler. Results show that less than 1% surface light exists below 2.5 m due to high concentrations of dissolved and colloidal humic organic matter. During the summer, C02 accumulation was found to be greater than 02 removal in the hypolimnion. During winter stratification this condition exists for the whole lake. C02 uptake was fond in situ in sediment surface incubations at 3.5 m. This was associated with the anaerobic photosynthesis of an epipelic mat of blue-green algae. The RQ of the lake community was greater (.85) than expected due to the mixed community of aerobes and anaerobes. The higher than expected RQ describes the amount of metabolism for which oxygen has not yet been the terminal electron acceptor. (Seigler-IPA)
W81-00341

HYDROLOGIC BUDGET FOR EAGLE LAKE NEAR WILLMAR, MINNESOTA,
Geological Survey, St. Paul, MN. Water Resources Div.
C. F. Myette.
Available from OFSS, Box 25425, Fed. Ctr., Denver, CO 80225, paper copy $2.00, microfiche $3.50. Geological Survey Open-File Report 80-163, 1980. 13 p, 4 Fig, 1 Tab, 11 Ref.

Descriptors: *Hydrologic budget, *Lakes, *Minnesota, *Eutrofication, *Hydrologic equation, Darcys law, Streamflow, Flow nets, Hydrogeology, Glacial drift, *Eagle Lake (MN), Hawk Creek(MN), Willmar(MN).

Eagle Lake occupies 890 acres of a 9,000-acre watershed in central Minnesota. Because of its proximity to Willmar, many homes and summer cabins have been built around the lake. Presently (1978), the shore is more than 90 percent developed. One effect of this development is accelerated eutrophication, most commonly shown by algae blooms. An annual hydrologic budget for Eagle Lake was prepared for the 1978 water year in support of a nutrient study prepared by the University of Minnesota at Morris. Results show that the amount of water that flowed through Eagle Lake in the 1978 water year was 6,670 acre-feet. Inflow to the lake was 45 percent surface water, 22 percent ground water, and 33 percent precipitation. Outflow was 73 prcent surface water, 25 percent evaporation, and slightly greater than 2 percent net change in lake storage. Estimates for the ground-water component were derived both as a residual in the hydrologic-budget equation and by flow-net analyses. The residual value of 1,450 acre-feet compared favorably with the flow-net value of 1,400 acre-feet. (USGS)

VARIABILITY IN MICROBIOLOGICAL DATA FROM A STRATIFIED EUTROPHIC LAKE,
Freshwater Biological Association, Ambleside (England).
J. G. Jones, and B. M. Simon.
Journal of Applied Bacteriology, Vol 49, No 1, p 127-135, August, 1980. 6 Fig, 1 Tab, 23 Ref.

Descriptors: *Microbiology, *Lakes, *Eutrophication, Bacteria, Chlorophyll, Hypolimnion, Limnology, Thermal stratification, Oxygen, Lentic environment, Sediments, Sampling, Analytical techniques, Water quality, Lake stages, Seasonal.

The degree of variability in direct bacterial counts, electron transport system activity, ATP levels, chlorophyll a concentration, and chemiluminescence was studied in a stratified eutrophic lake. The Blelham Tarn, Cumbria (England) is 0.67 km long and averages 14.5 m in depth. In summer, it becomes thermally stratified, and the hypolimnion is deoxygenated, usually to within 6 m of the surface. In August, sediment and water column samples were taken at seven points along a line transecting the tarn, and heterogeneity in the horizontal and vertical dimensions was examined. The scale of variability was compared with intra- and inter-sample errors. For samples taken at a single site, the coefficient of variation was often as great as the variability found between sites in a transect across the lake, especially for sediments. Seasonal variability in sediment activity was comparable to coefficients of 30% and greater reported for oxygen uptake in previous experiments. It has been suggested that thermal stratification and deoxygenation of the hypolimnion may affect sediment microbiota to an even greater degree than that in the water column. The results of this study should indicate the number of sampling as needed to achieve a given degree of precision when examining microbiological parameters of a stratified lentic system. (Geiger-FRC)

PHYSIOLOGICAL ADAPATATIONS IN RESPONSE TO ENVIRONMENTAL STRESS DURING AN N2-FIXING ANABAENA BLOOM,
North Carolina Univ., at Morehead City. Inst. of Marine Sciences.
P. E. Keller, and H. W. Paerl.
Applied and Environmental Microbiology, Vol 40, No 3, p 587-595, September, 1980. 4 Fig, 4 Tab, 46 Ref.

Descriptors: *Anabaena, *Lakes, *Eutrophication, *Nitrogen fixation, Adaptation, Algae, Aquatic plants, Carbon dioxide, Diurnal, Carbon fixation, Photosynthesis, Oxygen demand, Radiation, Dissolved oxygen, Epilimnion, Leutic environment, Phytoplankton.

The heterocystous blue-green algae, Anabaena spiroides has been shown to maintain prolonged and intense biomass production in the epilimnion of a eutrophic lentic environment (Thompson Lake, Ontario) that caused photooxidative death to many phytoplankton. Chlorophyll-a was protected from photooxidation by increased carotenoid production in A. spiroides, which retarded catalysis of other cell photooxidative reactions. Maximum use of photosynthetic active radiation (PAR) was achieved by temporally separating carbon dioxide and elemental nitrogen fixation. Carbon dioxide fixation was at a maximum in the morning before the afternoon buildup of dissolved oxygen, while

elemental nitrogen fixation, being less oxygen sensitive, peaked during the afternoon, after maximum incident PAR levels were reached. The advantages of the diurnal partitioning of carbon and elemental nitrogen fixation are the minimization of competition for reductant-generating compounds and the ample supply of carbon skeletons to accept fixed ammonia. Thus, survival of Anabaena in eutrophic waters was attributed to physiological factors, namely the utilization of radiant energy for reproduction and the ability to dominate surface waters by shading deeper phytoplankton during summer blooms. FORESTED WETLANDS IN EASTERN CONNECTICUT: THEIR TRANSITION ZONES AND DELINEATION,
GCA Corp., Bedford, MA. GCA Technology Div.
P. H. Anderson, M. W. Lefor, and W. C. Kennard.
Water Resources Bulletin, Vo 16, No 2, p 248-255, April 1980. 1 Fig, 4 Tab, 17 Ref. OWRT A-058-CONN(4), 14-31-0001-4007.

Descriptors: *Wetlands, *Forests, *Vegetation, *Soil water, *Connecticut, On-site investigations, On-site data collections, Data processing, Mathematical models, Analytical techniques, Moisture content, Soils, Soil moisture, Soil chemistry, Soil science, Freshwater wetlands, Wetland delineation, Forested wetlands, Discriminant analysis.

The delineation of inland wetlands requires close field examination of the biological and physical gradients (transition zones) between wetlands and bordering uplands. As part of a study on the detection and delineation of inland wetlands in eastern Connecticut by remote sensing techniques, this effort was designed to investigate vegetation distribution and composition and selected physical and chemical properties of the soils of wetland to upland transition zones in deciduous wetland forests. Field research was conducted during the growing season of 1975 within a test area consisting of the 45-sq mi Town of Mansfield, Connecticut. Changes in vegetation composition and structure, soil pH, and soil water content were determined along line transects extended over wetland to upland transition zones. Differences in soil pH occurred along the transects but were of such magnitude that they probably have little impact on plant distribution. There were significant changes in soil water content along the wetland to upland gradients. Discriminant analysis applied to statistical 'index of abundance' data describing vegetation distribution among the various zones (wetland, transition, upland) showed which plant species best distinguish wetlands from uplands. Of the criteria studied, vegetation composition and distribution, soil water content, and relief are the most useful criteria for delineating deciduous wetland forests. (Sims-ISWS)

WATER CONSERVATION THROUGH PLANT BREEDING - ALFALFA,
New Mexico State Univ., Las Cruces.
M. Wilson, and B. Melton.
In: A Quarter Century of Water Research. Proceedings of the Twenty-Fifth Annual New Mexico Water Conference. Apr. 24-25, 1980. WRRI Report No 124, Aug. 1980. p 105-108. New Mexico Resources Research Institute, New Mexico State University, Box 3167 Las Cruces, NM 88003.

Descriptors: *Alfalfa, *Plant breeding, *Genetics, *Moisture availability, *Agriculture, *Planting management, Water requirements, Phenology, Irrigation systems, Crop response, Adsorption, Crop production, Phylogeny.

The need for water conservation has forced plant breeders to reevaluate management systems which utilize large quantities of water in an effort to obtain maximum production. Alfalfa normally requires large amounts of water for optimum production, however, many studies have commented on its drought resistance. This illustrates the possibilities of genetic variability that may occur as a result of diverse moisture conditions. Significant differences were obtained among twenty-four alfalfa varieties evaluated under 16, 48 and 80-acre-inch per year irrigation regimes. These results suggest that by genetic manipulation, it may be possible to devlop varieties which will perform better than existing varieties under limited moisture conditions. Further evidence of useful plant variation was obtained by comparing plants selected from differing screening procedures. Field and greenhouse tests have been established to evaluate the extent to which these results will be transmitted to the next generations. (Vernale-Omniplan)

2J. Erosion and Sedimentation

GEOLOGIC AND GEOMORPHIC ASPECTS OF STREAMBANK EROSION IN THE YAZOO HILL STREAMS,
Army Engineer District, Vicksburg, MS. Potamology Section.
R. E. Rentschler.
In: Proceedings, 14th Annual Mississippi Water Resources Conference, 24-25, September 1979. p 43-48, (1979) 21 Fig.

Descriptors: *Mississippi, *Yazoo Basin, *Erosion control, *Bank erosion, Bank stability, Degradation(Stream), Stream erosion, Erosion rates, Stream stabilization, Stream improvement, Geologic formations, Rocks, Cutoffs, Channel improvement.

A series of grade control structures are being constructed and studied on several Yazoo Hill Streams in an attempt to develop methods for controlling the serious erosion in the area. For the past 150 years the Yazoo Basin in Mississippi has suffered an accelerated rate of erosion due to early agricultural practices. The main factor in stream bank erosion in the area is bed degradation, much of which was caused by man straightening, channelizing, or in some way altering the stream. Channel straightening and cutoffs have severely damaged the upper reaches of South Fork Tillatoba Creek. The construction of a cutoff changed the stream's natural slope, alternate bar sequence, sediment movement, and channel geometry. A series of aerial photographs illustrate this example. In general, the hill streams of the Yazoo area have a definite lack of stabilizing geologic formations within their channels. Bedrock in the channels is predominantly a poorly cemented iron sandstone. Bank erosion is directly related to the resistance of the materials in the bed and the banks. Prior to any form of stream improvement, the composition of the bed should be studied as a key to future stream conditions. (See also W81-00290) (Seigler-IPA)

SEDIMENT SOURCES AND YIELDS FROM UPLAND WATERSHEDS IN NORTH MISSISSIPPI,
Science and Education Administration, Oxford, MS. Sedimentation Lab.
F. E. Dendy, S. J. Ursic, and A. J. Bowie.
In: Proceedings, 14th Annual Mississippi Water Resources Conference, 24-25, September 1979. p 49-54, (1979) 6 Fig, 4 Tab, 12 Ref.

Descriptors: *Mississippi, *Sediment yield, *Watersheds(Basins), Sediment load, Land use, Sediment transport, Erosion, Gullies, Rainfall, Runoff, Forests, Pastures, Soil erosion, Mathematical studies.

Nineteen small unit source watersheds and five large mixed-cover watersheds located in the Pigeon Roost Creek basin in Marshall County, Mississippi, were used to show that sediment yields from small unit source watersheds can be used to predict sediment yields from the large watersheds. Of the small watersheds, one was in pasture, two in cultivation, and sixteen in abandoned fields and forest. The large, mixed-cover watersheds ranged in size from 1000 to 22,800 acres with 20 to 25% cultivated, 40 to 50% pasture or idle, and 30 to 40% forest. Annual rainfall, runoff, and sediment yields for the small watersheds are summarized. Large differences in runoff among land uses are evident. Annual sediment yields in the small watersheds ranged from a few pounds per acre from forest land to 43 tons per acre for cultivated land. Annual runoff-sediment relationships from the small watersheds were used to compute sediment yields for the five large watersheds. Computed yields and measured yields compared favorably. In the large watersheds, cultivated land, gullies, and stream channels composed 25% of the area and contributed 95% of the sediment yield. Pasture-idle land with 38 to 50% of the total area contributed 5% of the sediment yield and forest land, 25 to 43% of the area, contributed only 0.2% of the sediment yield. In: Proceedings, 14th Annual Mississippi Water Resources Conference, 24-25, September 1979. p 55-59, (1979) 3 Fig, 6 Tab, 9 Ref.

Descriptors: *Rainfall-runoff relationships, *Sediment load, *Sediment transport, Soil erosion, Surface runoff, Loam, Soybeans, Wheat, Agriculture, Phosphorus, Nitrogen, Clays, Sediment yield, Nutrient removal.

Soil loss and the chemical composition of runoff were studied for various tillage management systems on bottomland during simulated rainstorms. Soil erosion and runoff have traditionally been studied for sloping uplands but concern about the transport of agricultural chemicals in low-land areas such as soybean bottomlands is growing. One tillage management system studied used double cropping with soybeans and wheat. The other system, minimum tillage, was identical except that no wheat was planted. A fallow system was also tested. Two 60-minute simulated rainstorms were applied. Between 20 and 25 'grab' samples were collected per plot for each storm. Samples were analyzed in the laboratory for sediment concentration, dissolved solids, and the nitrogen, phosphorus, and potassium content of the water and/or sediment. Chemical or sediment concentrations were integrated over the hydrograph or sedigraph to determine total losses. Results show that soil loss from the minimum tillage was substantially less than from the fallow system. Nutrient loss from both the double cropping and minimum tillage systems was substantial. The clay content of sediment was found to increase as sediment yield decreased. (See also W81-00290) (Seigler-IPA)

SOME APPLICATIONS OF THE CONCEPT OF GEOMORPHIC THRESHOLDS,
S. A. Schumm.
In: Thresholds in Geomorohology, p 473-485, 1980. 7 Fig 27 Ref. Ge, 27 Ref. George Allen and Unwin, London. OWRT-B-150-COLO(3), 14-34-0001-7143.

Descriptors: *Geomorphology, *Thresholds, *Erosion, *Deposition(Sediments), Terraces(Geologic), Gullies, Slopes, Glaciers, Hydrogeology, Forecasting, Land farming, Meanders, Sedimentology, Cutoffs, Arroyos

The concept of geomorphic thresholds, thresholds of landform stability that are exceeded either by progressive change of the landform or by change in an external variable, can be applied to both

geomorphic and land management problems to identify those conditions at which a landform is incipiently unstable. If the threshold is crossed due to internal influences, the threshold is intrinsic. If the threshold is crossed due to a change in an external variable, the threshold is external. Threshold an episodic erosion can be used to explain anomalous erosion and deposition changes whether as a result of man's activities or as a normal part of landscape evolution. To advise engineers and land manager's a geomorphologist must identify the type of geomorphic threshold that is causing a change such as fan-head trenching, arroyo cutting, gully development, stream capture, pattern change, and meander cutoff. Rivers near the threshold of pattern change, such as the Chippea River in Wisconsin, can be identified to aid in planning. Also, the geomorphologist considers the fact that erosion or deposition are not always progressive. The crossing of thresholds in high-relief areas may produce episodic erosion or deposition. A FIELD CALIBRATION OF THE SEDIMENT-TRAPPING CHARACTERISTICS OF THE HELLEY -SMITH BEDLOAD SAMPLER,
Geological Survey, Lakewood, Co. Water Resources Div.
W. W. Emmett.
Available from Supt. of Documents, GPO, Washington, DC 20402, Price, $3.25. Geological Survey Professional Paper 1139, 1980. 44 p, 48 Fig, 13 Tab, 13 Ref.

Descriptors: *Bed load, *Bed load samplers, *Trap efficiency, *Fluvial sediments, *Particle size, Sedimentation rates, Sediment discharge, Measurement, Streamflow, Data collections, *Helley-Smith bedload sampler, *Conveyor-belt bedload sampler, *East Fork River(WY).

For sediment particle sizes between 0.50 mm and 16 mm, the Helley-Smith bedload sampler has a near perfect sediment-trapping efficiency. For particles sizes smaller than 0.50 mm, the Helley-Smith sampler has a high bedload sediment-trapping efficiency because part of the sediement retained by the sampler has been transported in suspension and it cannot be quantified separately from the bedload. For particle sizes larger than about 16 mm, the Helley-Smith sampler has low sediment-trapping efficiency but this may be related to the paucity of coarse particles in transport in the calibration tests rather than reflecting an actual low trap efficiency for large-size particles. CONSERVATION IMPACTS AND PRACTICES OF SAND REMOVAL FROM DRY BED OKLAHOMA RIVERS,
Oklahoma State Univ., Stillwater.
J. Harp, and R. C. Chang.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-124158, Price codes: A03 in paper copy, A01 in microfiche. Oklahoma Water Resources Research Institute, Oklahoma State University, Technical Completion Report, September 1980. 34p, 4 Fig, 2 Tab, 24 Ref. OWRT-A-092-OKLA(1), 14-34-0001-0138.

Descriptors: *Channel improvements, *Dry beds, Flood plains, Guidelines, Streambeds, Meandering, Physical impacts, Regulations, Removal, Rules, *Sand mining, Effects, *Streamflow, *Sedimentation, Siltine, Urbanization, Storm runoff, Channel flow, Oklahoma.

An analysis of the response of a river system to sand mining requires establishing the morphology and hydraulics of the system prior to man's activities. The complexity of alluvial channel flow and the dynamic nature of river systems are reflected in the large number of interrelated variables necessary to describe natural streams. A number of interdependent factors responsible for changes in channel characteristics are discussed. As a general effect, sand mining decreases the local flow velocity with an attendant increase in flow capacity and more water storage becomes available. The long-term impact depends on the rates of sand removal and natural supply. Overmining results in lowering the base level for upper reaches and tributaries. The reduction of bedload will induce the down stream tendency to decrease the channel width-to-depth ratio and increase the sinuosity. An understanding of the meandering process reveals the best-location and time for mining sand. Not all sand removal activities are detrimental. In fact, if under proper guidance, sand mining can act as a flood plain management factor and produce overall benefits. A set of guidelines for prudent sand mining is presented.

KNICKPOINT MIGRATION DUE TO BASELEVEL LOWERING,
Geological Survey of Israel, Jerusalem.
Z. B. Begin, D. F. Meyer, and S. A. Schumm.
Journal of the Waterway, Port, Coastal and Ocean Division, American Society of Civil Engineers, Vol. 106, No WW3, Proceedings Paper 15651, p 369-388, August 1980. 18 Fig, 26 Ref, 2 Append.

Descriptors: *Erosion, *Streams, *Model studies, Mathematical models, Hydraulic models, Flumes, Gullies, Sediments, Sediment discharge, Flow, Topography, Channel morphology, Environmental engineering, Agricultural engineering, *Sediment transport, Knickpoint migration.

The migration of knickpoints in alluvial channels was studied in 15-m and 20-m long flumes, sloping at 0.01 cm/cm. The channels were formed in response to baselevel lowering with two modes of migration: (1) migration of a constant vertical knickpoint and (2) migration of an initially vertial knickpoint which flattens and is finally eliminated. Each mode of migration was described by a different equation of motion, which results in a different migration curve. The rate of knickpoint migration hinges upon the channel ability to transport downstream the sediments supplied to it by the receding knickpoint. In this context the mechanism of transport is very important, because wash load is essentially independent of channel attributes. This study showed that in response to baselevel lowering, a knickpoint migrates upstream at a decreasing rate even when water discharge remains constant, and the rate is also affected by the shape of the knickpoints. PARTICLE TRANSPORT FROM THE WEST AFRICAN SHELVES OF LIBERIA AND SIERRA LEONE TO THE DEEP SEA: A CHEMICAL APPROACH,
University of South Florida, St. Petersburg. Dept. of Marine Science.
D. W. Eggimann, P. R. Betzer, and K. L. Carder.
Marine Chemistry, Vol 9, No 4, p 283-306, August, 1980. 5 Fig, 3 Tab, 39 Ref, 1 Append.

Descriptors: *Suspended solids, *Sediment transport, *Continental shelf, *Continental slope, Marine geology, Africa, Chemical analysis, Oceans, Aluminum, Iron, Magnesium, Manganese, Silicates, Inorganic compounds, Mineralogy, Tracers, Basin.

Suspended particle transport through the sea was examined over a 480-km section of the Liberia-Sierra Leone continental shelf off West Africa using the chemical and mineralogical composition of the particles as tracers. Ratios of Si/Al, Fe/Al, Mg/Al, and Mn/Al were used to detect shelf-derived matter in slope waters. The use of light-scattering and particle-mass measurements was not applicable to most of the material analyzed, so that chemical identification of particulates was necessary. Suspended particulates and sediments from the adjacent eastern Atlantic basin were similar in chemical and mineralogical composition to those in the water column seaward of the West African continental shelves. However, these basin specimens were distinct from Sahelian dust, which is thought to be the main source of sedimentary matter for tropical and semi-tropical regions of the deep eastern basin. These results indicate that shelf input of matter to the deep sea may be greater than was previously suspected. (Geiger-FRC)

ASPECTS OF DRAINAGE BASIN MORPHOMETRY OF RELEVANCE TO ARCTIC HYDROLOGY,
Winnipeg Univ. (Manitoba).
W. Rannie.
In: Proceedings of the Technology Transfer Workshop, Environmental Impact Assessment in the North, Oct 31, Nov 1-2, 1978. Inland Waters Directorate, Ottawa,l Ontario, Canda, Technical Workshkop Series No 1, p 10-11, 109-120, 1979. 43 Ref.

Descriptors: *Environmental impact assessment, *Arctic, *Northern development, *Environmental effects, Watersheds, Hydrologic properties, Morphology, Drainage, *Sediment transport, Sediment yield, Equations, Precipitation, Runoff, Morphometric analysis, Glaciation, Canada.

In regions of very little precise data on streamflow and sediment regimes, study of basin properties has relevance for comparative studies within or between regions, the basin properties especially reievant to arctic hydrology are basin aspect, relief, relief distribution, drainage density, drainage area, area of lakes and glacial history. Morphology is also used to prepare prediction equations. A sediment yield equation based on morphologic parameters is presented which appears to have merit for preliminary evaluation of regional sediment transport rates. A description and reason for examining each of these points is discussed. Finally, it is noted that Arctic basins have a number of features in common with urban and semi-arid basins. A review of available models might provide useful data to northern programs. (WATDOC)

THE EFFECT OF NITRATE ON NITROUS OXIDE REDUCTION IN ORGANIC SOILS AND SEDIMENTS,
Agricultural Research and Education Center, Belle Glade, FL.
R. E. Terry, and R. L. Tate, III.
Soil Science Society of America Journal, Vol 44, No 4, p 744-746, July-August 1980. 3 Tab, 12 Ref. OWRT-B-041-FLA(1), 14-34-0001-9063.

Descriptors: *Saturated soils, *Denitrification, *Nitrogen cycle, *Organic soils, Soil chemistry, Nitrates, Soil science, Oxides, Sediments, Analytical techniques, Testing procedures, Analysis, Data collections, Chemical reactions, Chemical analysis, Histosols.

Inhibition of N20 reduction by NO3(-) in cultivated Pahokee muck was determined by measuring N20 accumulation in soil samples incubated in the presence and absence of acetylene. At NO3(-)-N levels of 40 mg/liter or greater, nearly 100% of the gaseous denitrification products were N20 in Pahokee muck. Reduction of the accumulated N20 proceeded rapidly after the NO3(-) was exhausted from the soil. In comparison, N20 was readily reduced in ditch sediment samples in the presence of comparable concentrations of NO3(-). With NO3(-)-N concentrations in the ditch sediments ranging from 90 to 39 mg/liter, less than 10% of the gaseous denitrification products were N20. Similarly, NO3(-) levels in soil samples from a vegetable field which had been flooded 22 days had negligible effect on N20 reduction. These data demonstrate that the inhibitory effect of NO3(-) on N20 reduction was less in sediments and in organic soils that had been subjected to prolonged flooding than in the cultivated soils. 3A. Saline Water Conversion

METHOD FOR BRINGING NUTRIENT-RICH WATER FROM THE APHOTIC ZONE OF THE OCEAN TO THE PHOTIC ZONE,
W. T. Finley.
U.S. Patent No 4,189,379, 4 p, 1 Fig, 13 Ref; Official Gazette of the United States Patent Office, Vol 991, No 3, p 988-989, February 19, 1980.

Descriptors: *Patents, *Desalination, *Nutrients, *Water treatment, Oceans, Aphotic zone, Euphotic zone, Electrodialysis, Movement, Conduits.

Nutrient-rich ocean water from the aphotic zone of the ocean, which normally begins at about 100 to 200 meters below the ocean surface, is desalinated or partially desalinated in situ using electrodialysis to leave the nutrients in the water. The nutrient-rich desalinated water thus obtained, being of lesser density than the surrounding seawater, naturally rises through conduits into the relatively nutrient-poor photic zone of the ocean and is dispersed therein, thus increasing the concentration of nutrients in the photic zone near the surface of the ocean. This increases the fertility of the near-surface photic zone, and thus increases the supply of harvestable food fish from the near-surface photic zone. (Sinha-OEIS)

3C. Use Of Water Of Impaired Quality

SALINE WATER UTILIZATION - AN INTERNATIONAL PERSPECTIVE,
New Mexico State Univ., Las Cruces.
G. O'Conner.
In: A Quarter Century of Water Research. Proceedings of the Twenty-Fifth Annual New Mexico Water Conference. Apr. 24-25, 1980. WRRI Report No 124, Aug. 1980. p 68-77. New Mexico Resources Research Institute, New Mexico State University, Box 3167 Las Cruces, NM 88003 2 Tab, 9 Ref.

Descriptors: *New Mexico, *Saline water, *Irrigation practices, *Plant breeding, *Crop production, *Halophytes, Sodium, Soil structure, Agricultural engineering, Soil management, Agronomy.

Saline water utilization has tremendous potential in New Mexico and throughout the world. Some early research in Israel utilized very saline groundwater to grow non-halophytic trees and conventional crops, such as sugar beets and barley. In 1977, tomatoes and barley were grown in New Mexico's sand dunes with Pacific Ocean water. Current research approachs to test saline water utilization include using naturally occurring halophytic (salt-tolerant) species to supplement traditional crops, breeding and/or selecting for salt tolerance and substituting saline water for fresh water. Using saline irrigation water can require different management techniques such as, high frequency trickle irrigation, soil amendments (gypsum), increased leaching, and using more salt-tolerant crops. Saline-water utilization may not be feasible for all agricultural settings. Long-term studies of 3 to 5 years are needed. The critical element determining the quality of saline water is the level of total dissolved solids (TSD). (Atkins-Onmiplan)

3D. Conservation In Domestic and Municipal Use

MAKE SEWAGE A VALUABLE COMMODITY,
Westminster, CO.
B. Christopher.
American City and County, Vol 95, No 7, p 47-48, July, 1980. 1 Fig.

Descriptors: *Irrigation practices, *Farms, *Sewage sludge, *Water reuse, *Return flow, Sewage, Waste water disposal, Sewage effluents, Waste water treatment, Sludge disposal, Liquid wastes, Injection wells, Fertilizers, Sewage treatment, Water conservation, Ultimate disposal, Pumping plants.

The city of Westminster, Colorado, in a project 75% funded by EPA, is cooperating with farmers downstream to reuse existing water resources and to make use of waste water effluent. The city's secondary sewage effluent is exchanged for an equal amount of the farmer's irrigation water. Since June 1978, the pumping station at the 2.25 mgd city waste water treatment plant has been pumping 5 acre ft/day effluent to farmers (average daily city water use = 23.63 acre ft). The total water exchanged during the 2-yr program has been 1,206 acre ft. By June 1982, the waste water treatment plant's capacity will have been expanded to 5.0 mgd, and the program will have the potential to provide the city with approximately 2,000 acre ft/yr of exchanged water, enough to support an estimated 6,000 single family dwelling units. Water quality is tested daily, and water tested in August 1977 and August 1978 showed no change in quality. Westminster plans to build a reservoir in which to store its winter effluent until the farmers need it in spring. The second aspect of the reuse plan consists of injecting all the city's liquid sludge from the treatment plant into cultivated farm land, a process more efficient than spreading because it eliminates loss through evaporation of about 70% of the sludge ammonia values. One farmer found that 16 acres of sludge-treated soil produced 19.2 tons/acre of corn compared with 17.6 tons/acre for 16 acres of untreated soil. (Gish-FRC)

WATER CONSERVATION ALTERNATIVES FOR THE NORTH,
Environmental Protection Service, Ottawa (Ontario). Water Pollution Control Directorate.
J. J. Cameron, and B. C. Armstrong.
Economic and Technical Report EPS 3-WP-80-2, 1980. 45p, 5 Fig, 10 Tab, 32 Ref.

Descriptors: *Water conservation, *Wastewater reuse, Public services, Water requirements, *Cost-benefit analysis, Economics, Northwest Territories, *Canada, Pricing, Plumbing codes.

This report reviews water use characteristics, pricing policies, plumbing codes, public acceptance, water conservation experiences, and the methods and technology to reduce water use and the concomitant energy requirements. Various administrative alternatives and water conservation technology for toilets, bathing, laundry, kitchen and households are analyzed with respect to appropriateness, public acceptance and cost-effectiveness. Economic analyses and water conservation strategies for both trucked and piped utility systems are presented. Trucked systems are preferred in communities with limited water supplies, and very low water use fixtures such as recirculating toilets, self-closing hand-held shower units and spray faucets are recommended. If a central laundry facility is installed, household water requirements can be reduced to only 13 litres per person per day. A final recommendation is made for a water conservation demonstration project to monitor retrofit and new installation for both the piped and trucked systems. (WATDOC)

3E. Conservation In Industry

THE IMPACT OF ENERGY DEVELOPMENT ON WATER RESOURCES,
New Mexico Energy and Minerals Dept., Santa Fe.
L. Kehoe.
In: A Quarter Century of Water Research. Proceedings of the Twenty-Fifth Annual New Mexico Water Conference. Apr. 24-25, 1980. WRRI Report No 124, Aug. 1980. p 160-174, New Mexico Resources Research Institute, New Mexico State University, Box 3167 Las Cruces, NM 88003.

Descriptors: *Synthetic fuels, *New Mexico, *Water utilization, *Natural resources, *Coal, *Energy development, Oil shale, Legislation, Research and development, Energy conversion, Surveys, Biomass, Fossil fuels, Natural gas, Water allocation.

An overview of President Carter's synthetic fuels program, its relation to water usage and the availablility of natural resources in New Mexico is presented. The $80 billion synfuels program is expected to produce the equivalent of 2.5 million barrels of oil a day from coal liquefaction, coal gasification, oil shale biomass and unconventional gas. The reports supporting this replacement of oil do not include information on the water usage that will be involved. Figures are shown comparing projected U.S. synfuels production in 1985 and in 1980 using low-, medium-, and high-effort scenarios. A seven-fold increase is expected during this time using a 'crash program.' A second figure shows the relative magnitude of production by various sources of synfuels with almost one-half of the total goal expected to come from coal liquids and gases. New Mexico's fossil fuel supply, over three-quarters coal, may play a significant role in that production. These new fuel sources will require more water than current energy sources. The amount of water tp produce 1 quad BTU for seven traditional and proposed fuel sources is depicted Production of high BTU coal gasification requies nearly fifteen times as much water as the present technology to produce natural gas. Public attitude surveys regarding water, its applications, and energy resources and development as related to the total social and economic structure in New Mexico are discussed. (Vernale-Omniplan)

A REGIONAL EVALUATION OF OFF-SEASON AGRICULTURAL USE OF WATER AND ENERGY RESOURCES,
South Dakota State Univ., Brookings. Water Resources Inst.
M. L. Horton, C. G. Carlson, R. E. Beyer, L. R. Stone, and R. E. Gwin, Jr
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-127342, Price codes: A05 in paper copy, A01 in microfiche. Completion Report, October, 1980. 89 p, 36 Fig, 44 Tab, 41 Ref. OWRT-B-052-SDAK(1), 14-34-0001-7187.

Descriptors: *Irrigation practices, *Supplemental irrigation, *Irrigation effects, *Evaluation, *Crop production, Irrigation, Experimental farms, Montana, Kansas, South Dakota, Irrigation water, Irrigation systems, Water utilization, Winter, Excess water(Soils), Autumn, Wheat, Alfalfa, Assessments, Crop response.

The underlying assumption for off-season irrigation has been that irrigation up to field capacity during the low evaporative demand seasons, Fall, early/late Winter, and early Spring, would represent an efficient use of irrigation water. The major question analyzed in this study was: would off-season irrigation be a practical and workable practice. The study was carried out by three independent research groups in Montana, Kansas, and South Dakota, and the three reports were separately presented. For South Dakota, the winter wheat crop did not appear to have increased winter survivability from fall irrigation, and weeds appeared much less manageable. If Fall irrigation is to be practiced, one-half the available soil moisture content should be the upper limits of off-season profile filling. For Montana, the second cutting in the Fall of 1979 was the only significantly different alfalfa

yield. Poor efficiencies were noted for Fall irrigations, with an apparent decrease in Fall-applied water carryover when the profile is filled above half of its water holding capacity. For Kansas it was concluded that Fall irrigation increasing the profile soil water content above 18 inches would be relatively inefficient in providing water for the next summer's crop. W81-00314

DRIP IRRIGATION SYSTEM,
Vernay Labs., Inc., Yellow Springs, OH. (Assignee).
G. E. Atkinson, and K. C. Tregillus.
U.S. Patent No 4,190,206, 5 p, 11 Fig, 3 Ref; Official Gazette of the United States Patent Office, Vol 991, No 4, p 1267, February 26, 1980.

Descriptors: *Patents, *Irrigation systems, *Application equipment, *Flow control, Irrigation efficiency, Irrigation operation and maintenance, Drip irrigation.

A drip irrigation system includes a flow control valve having an inlet opening which constricts in response to pressure increases to provide a uniform flow dispite pressure variations. The inlet opening of the valve has a rectangularly cross-sectioned central section and end sections which are non-rectangular, such as triangular or semi-circular, in cross section. During normal flow conditions the rectangular central section of the inlet opening is pressed closed and irrigation liquid flows at a constant rate through the two end sections. (Sinha-OEIS)

SELF-CORRECTING LINEARLY MOVABLE IRRIGATION SYSTEM,
Gifford-Hill and Co., Inc., Tulsa, OK. (Assignee).
G. A. Beusch, H. L. Thompson, H. E. Lindner, and G. G. Jones.
U.S. Patent No 4,190,068, 16 p, 7 Fig, 5 Ref; Official Gazette of the United States Patent Office, Vol 991, No 4, p 1219, February 26, 1980.

Descriptors: *Patents, *Irrigation systems, *Sprinkler irrigation, *Application equipment, Lateral conveyence structures, Irrigation efficiency, Irrigation operation and maintenance.

A linearly movable irrigation system includes interconnected power driven irrigation spans supporting a water supply conduit, whose sections are capable of moving over a land area and depositing a controlled amount of water. At one extremity of the irrigation system a steerable and powered mover unit is provided that accepts water from a water supply system and conducts it to the overhead irrigation pipe under sufficient pressure to cause proper distribution of water through sprinkler devices located along the length of the irrigation conduit. A power driven pump is supported by the steerable mover unit in order to pressurize or provide boosting pressure for the water. The steerable mover unit is adapted to move in proximity to an elongated reference which may be straight or curved as desired. The unit is provided with means for sensing stresses and angular relationship of the irrigation spans relative to the mover unit for providing control signals to the irrigation system that maintain stresses and angular misalignment of the system within an acceptable range. Each extremity of the irrigation system may move at different average speeds which are determined by the control signals for corrective relative movement. The extremities of the irrigation system may also move simultaneously at equal speeds or at different speeds to accomplish controlled movement during irrigation operations. (Sinha-OEIS)
W81-00369

SIMPLIFIED IRRIGATION CONTROLLER,
Toro Co., Riverside, CA. (Assignee).
T. L. Kendall.
U.U. Patent No 4,189,776, 16 p, 9 Fig, 4 Ref; Official Gazette of the United States Patent Office, Vol 991, No 3, p 1103, February 19, 1980.

Descriptors: *Patents, *Irrigation systems, *Control systems, Automatic control, Scheduling, Electronic equipment, Instrumentation, Irrigation efficiency.

The invention discloses a simplified solid state controller for use in controlling automatic irrigation systems. The operator input panel provides no means for the inputting of numerical irrigation information such as station start times and station run times. Rather, the input panel provides switch means whereby the operator can initiate a number of parameterization logic sequences where the current information data in memory is displayed to the operator. Through the input panel, the operator can cause the information displayed to be advanced to a new desired value an a step-by-step basis. Upon the displayed value being equal to the value desired as the new value by the operator, the operator signals to the logic of the controller through the input panel and the current value is updated to the presently displayed value. (Sinha-OEIS)
W81-00370

IMPORTANCE OF CROP PRODUCTION FUNCTIONS IN EVALUATING CONSUMPTIVE USE OF WATER,
New Mexico State Univ., Las Cruces. Dept. of Agricultural Engineering.
E. G. Hanson, and T. W. Sammis.
In: A Quater Century of Water Research. Proceedings of the Twenty-Fifth Annual New Mexico Water Conference. Apr. 24-25, 1980. WRRI Report No 124, Aug. 1980. p 36-58. New Mexico Resources Research Institute, New Mexico State University, Box 3167 Las Cruces, NM 88003 14 Fig, 1 Tab, 13 Ref.

Descriptors: *New Mexico, *Crop production, *Irrigation, *Evapotranspiration, *Crop production functions, *Consumptive use, *Soil moisture, Grain crops, Lysimeters, Irrigation effects, Crop response, Plant growth, Field crops.

Determining consumptive use, also called evapotranspiration (ET), of selected crops and relating ET data to crop yield is required for many purposes. These include planning efficient irrigation systems, determining irrigation requirements and equitable water rights, and evaluating the life expectancy of water supply in underground basins. Normal consumptive use is the ET rate that occurs when crops produce average yields and may be determined by plotting the average yields on crop-production functions. Alfalfa, grain corn, cotton, chile and grain sorghum were grown at selected locations throughout New Mexico during 1976, 1977 and 1978. The Et rate was measured with a non-weighing type lysimeter and water balance technique. Yield was measured from the lysimeter and adjacent field at harvest time. Neutron access tubes installed in the lysimeters measured weekly changes in soil moisture every 15 cm of depth. Water applied by sprinkler-line source was measured with catchment cans. These data and data from other irrigation projects were used to derive crop-production function for each crops, excluding chile. Crop-production functions having high coefficients of determination appear to be a better method of estimating the normal ET required in an area. A more direct correlation was found between ET and alfalfa yield than for ET and grain crop yields. Variables that cause a reduction in ET may cause a corresponding reduction in crop yield. These variables include water stress, solar radiation, temperature, management, insects, grazing and increased soil salinity. (Vernale-Omniplan)

4A. Control Of Water On The Surface

STORMWATER MANAGEMENT IN THE UNITED STATES A STUDY OF INSTITUTIONAL PROBLEMS, SOLUTIONS AND IMPACTS,
Stormwater Consultants, Bolingbrook, IL.
H. G. Poertner.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-121048, Price codes: A11 in paper copy, A01 in microfiche. Report, September 1980, 240 p, 6 Fig, 12 Tab, 5 Append. OWRT-C-5239(No 4235)(1), 14-31-0001-4235.

Descriptors: *Administration, *Management, *Urban drainage, *Storm water, *Institutional constraints, Local governments, Runoff, Storm runoff, Urban runoff, Financial feasibility.

Personal interviews were conducted in many urban and metropolitan areas of the United States to investigate institutional problems in stormwater management. Successful solutions and the impacts and transferability of solutions were studied in detail. The objective was to prepare a report useful to local public officials and management personnel in developing and operating effective, economical and timely programs and facilities for managing stormwater. Extensive case studies were made of: Cook County, Illinois; Metropolitan Denver, Colorado; Fairfax County, Virginia; and the City and County of Tulsa, Oklahoma. The studies addressed the broad field of stormwater management, including both 'control' and 'developmental' activities. The institutional problems investigated were those that typically arise in creating, supporting and operating local stormwater management organizations and programs. Also studied were the institutional problems associated with implementation activities, including: planning, engineering, constructing, operating and maintaining physical facilities. These various problems are characterized in the report as: financial, administrative, organizational, jurisdictional, legislative, legal, political, social, economic, environmental, ecological, planning, public education and communication. Findings of the study and the author's conclusions and recommendations are given in the first chapter.

PERFORMANCE AND EFFECTS OF SCS FLOODWATER RETARDING STRUCTURES IN THE 1979 EASTER FLOODS,
Soil Conservation Service, Jackson, MS.
P. Forsythe, and R. Ulmer.
In: Proceedings, 14th Annual Mississippi Water Resources Conference, 24-25, September 1979. p 61-63, (1979) 2 Fig.

Descriptors: *Mississippi, *Flood control, *Flood drainage, *Farm ponds, Dams, Spillways, Scour, Erosion, Channels, Soil Conservation Service, Cow paths, Impoundments, Overflow, Flood flow, Spillway crests.

The performance of the floodwater retarding structures and farm ponds in the Pearl River Basin during the 20 + inch rainfall of April 12-13, 1979 was excellent. In general, failures occurred where proper design and maintenance were not provided. Ninety-nine percent of the farm ponds performed as designed without failure. The storm was massive, 2.4 times the 100 year-24 hr rainfall and 69% of 6 hr PMP. The Soil Conservation Service floodwater retarding structures are not designed for so large a storm but they performed well with only minor damage. Turbulence and scouring occurred in and beyond some emergency spillways due to fences and cow paths. Hop and skip flow conditions initiated by surface irregularities caused minor damages in the $1,000 to $5,000 range. Some farm pond failures can be attributed to debris plugged screens across spillways. Much more damage and inundation of urban areas would have occurred without the successful performance of the retarding structures. (See also W81-00290) (Seigler-IPA)

GREEN RIVER BASIN FLOW FORECASTING MODELS,
Purdue Univ., Lafayette, IN. Water Resources Research Center.
P. G. Katz, and G. H. Toebes.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-124448,

Price codes: A10 in paper copy, A01 in microfiche. Technical Report No 136, October 1980. 193 p, 56 Fig, 53 Tab, 17 Ref, 4 Append. OWRT B-094-IND(4).

Descriptors: *Streamflow forecasting, *Model studies, *Kentucky, *Reservoir operation, Reservoir releases, Reservoir storage, River forecasting, Flow nets, Reservoirs, *Green River Basin(KY).

River flow-watershed runoff models of the Green River Basin in Kentucky are needed for the efficient operation of the basin's reservoirs. Correlative linear models that relate reach outflow to reach inflows and to precipitation over the side-inflow contributing watersheds offer a relatively simple, easy to use method of satisfying the requirements. Difference models were constructed for the 9 river reaches into which the Green River System had been divided previously. Submodels and the basin model made by linking the submodels together were found to perform better than the linear models constructed earlier. Premultiplication of the precipitation by the average monthly runoff coefficient prior to the model identification phase was found to improve the forecasting accuracy of the resulting difference model. Problems which may be encountered in using the difference model with premultiplication of precipitation by the average monthly runoff coefficient for real-time forecasting were considered. In conjunction with this the manual flow forecasting methods used by Louisville District of the Corps of Engineers were examined. An automated procedure, called 'Computed Hydrograph Adjustment Technique' (CHAT) was shown to offer a potential for further model improvement.

AREAS OF NATURAL RECHARGE TO THE FLORIDAN AQUIFER IN FLORIDA,
Geological Survey, Tallahassee, FL. Water Resources Div.
J. W. Stewart.
Florida Bureau of Geology Map Series 98, 1980. 1 Sheet, 4 Fig, 11 Ref.

Descriptors: *Maps, *Natural recharge, *Aquifers, *Groundwater, *Florida, Aquifer characteristics, Surface waters, Potentiometric level, Water wells, Withdrawal, Water table, Pumping, Artificial recharge, Water quality, Water supply, Hydrogeology, *Floridan aquifer.

The Floridan aquifer, the most extensive and widely used aquifer system in Florida, consists chiefly of limestone and dolomite. The aqifer is at or near land surface in northwest and north-central Florida and about 1,000 feet below land surface in northwest and south Florida. It is overlain by surficial materials ranging in thickness from a few feet to several hundred feet, including water-bearing sands. Water is unconfined in the surficial aquifer and confined in the Floridan aquifer. Three types of classifications are used to delineate the relative effectiveness of natural recharge areas of the Floridan aquifer: least effective, moderately effective, and most effective. The least effective recharge areas are areas of artesian flow where the potentiometric surface of the Floridan aquifer is above land surface and recharge of the aquifer can not occur under natural conditions. About 50 percent of the State falls within this classification. The moderately effective recharge areas represent about 35 percent of the State and recharge rates are estimated to range from less than 1 to 10 inches per year. The most effective areas represent about 15 percent of the State and recharge rates range from about 10 to 20 inches per year. (USGS)

EVALUATION OF A CAVITY-RIDDLED ZONE OF THE SHALLOW AQUIFER NEAR RIVIERA BEACH, PALM BEACH COUNTY, FLORIDA,
Geological Survey, Tallahassee, FL. Water Resources Div.
J. N. Fischer, Jr.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-115776, Price codes: A04 in paper copy, A01 in microfiche. Geological Survey Water-Resources Investigations 80-60, 1980. 39 p, 13 Fig, 7 Tab, 13 Ref.

Descriptors: *Groundwater resources, *Aquifer characteristics, *Water quality, *Water yield, *Florida, Hydrogeology, Water supply, Saline water intrusion, Water pollution sources, Water wells, Water analysis, Evaluation, *Palm Beach County(FL), *Riviera Beach(FL).

The shallow aquifer near Riviera Beach, Palm Beach County, Fla., contains a cavity-riddled zone extending north and south about 5 miles inland from the Atlantic Ocean. The zone lies at approximately 60 feet below land surface and varies from 15 to 50 feet in thickness. It is approximately 3 miles in width. Aquifer material is calcareous quartz sand-stone in the cavity zone, whereas the remainder of the consolidated aquifer material is primarily limestone. The zone is overlain by several thin clay beds which provide varying degrees of confinement. The transmissivity of the cavity-riddled zone of the aquifer in the area of investigation is approximately 11,000 square feet per day. Preliminary evaluation indicates that large volumes of water of suitable quality for public supply can be developed from the zone, except in an area adjacent to a landfill where leachate has adversely affected water quality. 4C. Effects On Water Of Man's Non-Water Activities

TWO APPROACHES TO IDENTIFY STORM WATER RUNOFF LOADS,
Geological Survey, NSTL Station, MS. Gulf Coast Hydroscience Center.
W. H. Doyle, and M. E. Jennings.
In: Proceedings, 14th Annual Mississippi Water Resources Conference, 24-25, September 1979. p 101-106, (1979) 8 Fig, 5 Ref.

Descriptors: *Miami, Florida, *Houston, Texas, *Storm runoff, *Urban runoff, Water pollution sources, Sampling, Overland flow, Monitoring, Model studies, Computer models, Computer programs, Hydrologic data, Land use, Rainfall-runoff relationships.

Houston, Texas, and Miami, Florida, were the sites for two urban stormwater studies comparing a coarse modeling technique and an intense data collection modeling technique. In Houston the rapidly urbanizing Buffalo Bayou basin encompassing 975 sq mi was used. A broad-scale model, STORM (storage, treatment, overflow, and runoff), was used. It was calibrated for each of eight watersheds and five land use characteristics. Results show that annual storm-runoff loads ranged from 43 to 97% of total basin load. The Houston study illustrated the successful application of the broad-scale identification approach. The Miami study used a comprehensive data collection network to identify urban pollutant sources by sampling in small catchments of similar land use. An automated monitoring system was used to record rainfall and stage data and to activate the water sampling equipment. A data management system was developed to process the masses of data. Provided that funding and manpower are available this intensive approach can be successfully used to identify pollutants by land-use type. (See also W81-00290) (Seigler-IPA)
W81-00310

SUSPENDED-SEDIMENT DISCHARGE, IN FIVE STREAMS NEAR HARRISBURG, PENNSYLVANIA, BEFORE, DURING, AND AFTER HIGHWAY CONSTRUCTION,
Geological Survey, Harrisburg, PA. Water Resources Div.
L. A. Reed.
Available from Supt. of Documents, GPO, Washington, DC 20402, Price, $2.25. Geological Survey Water-Supply Paper 2072, 1980. 37 p, 17 Fig, 8 Tab, 10 Ref

Descriptors: *Sediment transport, *Sediment discharge, *Stream, *Road construction, *Pennsylania, Sediment load, Particle size, Streamflow, Turbidity, Rainfall-runoff relationships, Farm ponds, Tap efficiency, Erosion control, Sediment control, Basic data collections, *Harrisburg(PA), Pre-construction data, Cost-construction data.

Rainfall, streamflow, sediment, and turbidity data were collected as part of a study to evaluate the effects of highway construction on suspended-sediment discharges in stream near Harrisburg, PA. The study was also designed to evaluate the effectiveness of different erosion-control measures in reducing sediment discharge. Although highway construction increased suspended-sediment discharges from two to four-fold, the rate of sediment discharge quickly returned to pre-construction levels when construction ended. The most effective sediment control evaluated was offstream ponds, which were designed to trap and store sediment laden water from the construction area. The offstream ponds trapped about 70 perent of the sediment that reached them during most storms. Seeding and mulching generally reduced sediment loads about 20 percent. Rock dams and bales reduced loads about 5 percent. An onstream pond, constructed on a large stream below the construction area, reduced sediment loads about 80 percent. However, unlike the offstream ponds, which stopped discharging runoff water soon after precipitation ended, the onstream pond kept discharging runoff water, and the stream below the pond remained turbid for extend periods. 4D. Watershed Protection

USE OF BOUNDING WELLS TO NEGATE THE EFFECTS OF GRAVITY AND PRE-EXISTING GROUNDWATER MOVEMENT IN DIPPING AQUIFERS USED FOR STORAGE,
Louisiana State Univ., Baton Rouge. Dept. of Petroleum Engineering.
P. J. Abadie.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-124554, Price codes: A06 in paper copy, A01 in microfiche. Master of Science Thesis, August, 1979. 100 p, 8 Fig, 2 Tab, 16 Ref, 2 Append. OWRT-A-044-LA(2).

Descriptors: *Wells, *Aquifer management, *Laboratory equipment, *Mathematicat models, *Groundwater movement, *Gravity, *Underground storage, *Water loss, *Water conservation, Groundwater, Percolation, Water management(Applied), Water measurement, Flow measurement, Water, Injection wells, Water storage, Freshwater, Gradients(Streams), Mathematical studies.

Fresh water stored in a dipping saline aquifer results in the imigration of the bubble of injected water away from the injection/production well

due to pre-existing groundwater movement and gravity, possibly rendering a storage project economically useless due to low recovery of the injected fresh water. Bounding wells partially offset the deleterious effects of pre-existing flow and gravity. A computational procedure was developed for predicting the bounding well rates needed to negate the combined effects of pre-existing flow and gravity, and was verified using a laboratory size miniature aquifer. Efficacy of the bounding well systems studied was quantified by measuring recovery efficiencies (fraction of fluid recovered). Pre-existing flow and gravity tended to cause the injected fluid to migrate downdip in all runs. The injected fluid volume and the injection/production rate was the same for all runs. With a dip angle of 30 degrees, a density difference of 0.0163 g/cc and a pre-existing gradient of 0.05 psi/ft, recovery efficiency was 51.7% with no bounding wells; and 95.3% operating the bounding wells at the computed rates for this system. At a density difference of 0.55 g/cc, recovery efficiency was 33.6% and 20.9% with and without bounding wells. (Zielinski-IPA)

5A. Identification Of Pollutants

DIRECT DETERMINATION OF LEAD IN POLLUTED SEA WATER BY CARBON-FURNACE ATOMIC ABSORPTION SPECTROMETRY,
Napier Coll. of Commerce and Technology, Edinburgh (Scotland). Dept. of Biological Sciences.
M. C. Halliday, C. Houghton, and J. M. Ottaway.
Analytica Chimica Acta, Vol 119, No 1, p 67-74, September 1, 1980. 4 Tab, 24 Ref.

Descriptors: *Lead, *Sea water, *Spectrometers, *Analytical techniques, *Water sampling, Water pollution, Trace elements, Pollutant identification, Ammonium compounds, Instrumentation, Filtration, Salts, Dissolved compounds, Testing procedures, Water analysis, Chemical analysis.

A Perkins-Elmer 373 atomic absorption spectrometer equipped with a heated graphite atomizer HGA 2200 was used for the direct determination of lead in polluted sea water. The water was obtained from the outer Firth of Forth, filtered, then diluted (1 + 1) with deionized distilled water and ammonium nitrate (as a matrix modifier). Aliquots were injected into the furnace, which was equipped with a tantalum-coated graphite tube, under gas-stop conditions. The matrix modifier and the tube coating reduced the suppressive effects on the signal of salts present in the water to such a degree that the quantity of lead could be determined by the method of standard additions. When the sea water was not filtered prior to analysis, the variability in results was excessive. However, the results obtained by carbon-furnace atomic absorption spectrometry correlated significantly with those obtained by anodic stripping voltammetry ($r = 0.84$, $p < 0.01$) and were not significantly different according to the paired t test ($t = 0.93$). A marked improvement in reproducibility was achieved by filtration of the water, yielding a detection limit of 1 microgram Pb/liter. The method described allows the rapid screening of a large number of samples (approximately 50/day) with minimal effort if an automatic sampling device is used. (Gish-FRC)

FATE OF COLIFORM BACTERIA IN THE UPPER NEW YORK BAY,
Rutgers - The State Univ., New Brunswick, NJ. Water Resources Research Inst.
M. S. Finstein, and M. L. Morris.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-126534, Price codes: A03 in paper copy, A01 in microfiche. Final Report, October 1980. 4 p, 1 Fig, 11 Tab, 35 Ref. OWRT-A-049-MJ(1), 14-34-0001-8032.

Descriptors: *New York Bay, *Sewage effluents, *Coliforms, *Sewage bacteria, E. coli, Enteric bacteria, Water pollution sources, Microbiology, Waste water treatment, Chlorination, Water sampling, Environmental effects, New Jersey.

Quantitative and qualitative analyses were made of the coliforms in both the primary treated effluent and the receiving waters (New York Bay) of the Passaic Valley Sewerage Commissioners (PVSC) treatment plant. The membrane procedure was used to determine standard coliform counts and colonies were identified with the API 20E enteric identification system which consists of a battery of 23 biochemical tests. Treatment at the PVSC plant consists of primary sedimentation and, in season, chlorination. Water samples were taken at 11 stations in the Bay with a Kemmerer bottle. Sediment samples were taken with an Eckman dredge and were diluted with a phosphate buffer solution. The standard coliform count of the effluent was 100,000 to 5,000,000/ml. In order of abundance the major coliforms were: Klebsiella pneumoniae, Enterobacter cloacae, Citrobacter freundii, and Escherichia coli. In the Bay near the discharge field, the coliform count ranged from 210 to 740/ml. Leading contributors were: Enterobacter cloacae, Klebsiella pneumoniae, Citrobacter freundii, Escherichia coli, and Aeromonas hydrophila. Laboratory studies showed that the addition of effluent slow the disappearance of three of the coliforms from Bay water. (Seigler-IPA)
W81-00324

SOLUBILITIES OF PHENOL AND CHLORINATED PHENOLS IN SUPERCRITICAL CARBON DIOXIDE,
Delaware Univ., Newark. Dept. of Chemical Engineering.
R. Van Leer, A. Van Leer, and M. E. Paulaitis.
Journal of Chemical and Engineering Data, Vol 25, No 3, p 257-259, July 1980. 3 Fig, 3 Tab, 5 Ref. OWRT-A-045-DEL(2).

Descriptors: *Chlorine, *Carbon dioxide, *Phenols, *Solubility, Solvents, Solutes, Chemical precipitation, Saturation, Chemical properties, High pressure, Liquids, Waste water(Pollution), Columns.

The solubilities of three common waste water pollutants, phenol, p-chlorophenol, and 2,4-dichlorophenol, were measured in supercritical carbon dioxide as a function of pressure. Measurements were made at 36C over a range of 80 to 250 atmospheres. Phenol was also tested at 60C over the same range of pressures. For the testing liquid carbon dioxide at ambient temperature was charged into a Milton Roy high-pressure liquid pump to produce the desired pressures. The pump continuously delivered solvent at flow rates from 60 to 300 standard cu cm/min. The solvent was fed into two high-pressure equilibrium cells connected in series. The cells were columns packed with glass beads and the heavy solute. After leaving the cells the saturated solution was flashed to atmospheric pressure and the heavy component was collected in a cold trap to be measured with a wet-test meter. Results are given as tables and as plots. At 36C the solubility of phenol is similar to that of other solid-super critical fluid systems. At 36C the isotherms for p-chlorophenol and 2,4-dichlorophenol are characteristic of liquid-supercritical fluid systems. The results indicate that the solubilities in supercritical carbon dioxide increase as the number of chlorine groups on the solute increase, probably due to the decreased bonding in the condensed phase. IDENTIFICATION AND CONFIRMATION OF ATRAZINE IN POND WATER,
Colorado State Univ., Fort Collins. Inst. of Rural Environmental Health.
M. J. Aaronson, K. W. Kirby, and J. D. Tessari.
Bulletin of Environmental Contamination and Toxicology, Vol 25, No 3, p 492-497, September, 1980. 4 Fig, 1 Tab, 3 Ref.

Descriptors: *Triazine pesticides, *Farm ponds, *Fishkill, *Organophosphorus pesticides, Pesticides, Atrazine, Cyanazine, Gas chromatography, Mass spectrometry, Ponds, Farms, Degradation(Decomposition), Aquatic environment, Ecosystems, Thiocarbamate pesticides, Pollutant identification.

Large fishkills in a farm pond were attributed to atrazine, although the surrounding farmland showed recent applications of only Bladex (cyanazine), Counter (an organophosphate), and Sutan (a thiocarbamate). Pond water samples were extracted into methylene chloride. The latter two compounds were unidentifiable upon gas chromatographic/mass spectrometric analyses of extracts. The presence of atrazine in the pond water was positively confirmed, but its origin remained unknown. Private reports stated that cyanazine in soil would undergo degradation of the nitrile to form an amide which would convert to the acid with subsequent decarboxylation. From this process, atrazine would derive from cyanazine. Other experiments have shown that atrazine remained in the physical and biological components of pond water following a period of 2 yr after application. The possibility of atrazine entering the aquatic ecosystem after land application appears to be very high. (Geiger-FRC)

APPLICATION OF CURRENT METHODS FOR METALS DETERMINATION IN WASTEWATERS FROM THE ORGANICS/PLASTICS INDUSTRY,
Gulf South Research Inst., New Orleans, LA.
C. S. Monteith, and J. E. Gebhart.
Journal of Environmental Science and Health (A), Vol 15, No 5, Special Issue, p 503-511, 1980. 2 Tab, 3 Ref.

Descriptors: *Heavy metals, *Spectrophotometry, *Water analysis, *Organic wastes, Water pollution, Trace elements, Effluent streams, Industrial wastes, Digestion, Chemical wastes, Pollutant identification, Analytical techniques, Laboratory tests.

Aqueous samples taken from various process and effluent streams of organic and plastic chemical

industries were analyzed for 13 trace elements from the EPA list of priority pollutants by three laboratories using atomic absorption spectrophotometry. Cadmium, chromium, copper, lead, antimony, arsenic, beryllium, mercury, nickel, selenium, silver, thallium, and zinc were the elements determined. Sample preparation differed slightly in each laboratory. In two of the three laboratories, metal species which were recoverable in hot nitric acid, namely metals in the ionic state, were determined. The other laboratory used digestion methods to recover 'total' metals, meaning metals in the covalently bound state and in the ionic state. More rigorous digestion conditions were needed for recovery of covalently bound metals, so that a greater portion of the spike was lost than when using the digestion procedure employed by the other two laboratories. Another factor affecting recoveries of elements was the laboratory which analyzed the samples. It was suggested that mixtures of free and organically bound forms of elements be used as spikes to render a more realistic evaluation or recovery of 'total' metals to be made. (Geiger-FRC)

ANALYTICAL PROBLEM SOLVING WITH VERIFICATION SAMPLES INTERFERENCE REDUCTION OPTIONS,
PJB Laboratories/Jacobs Engineering, Pasadena, CA
C. Jackson, R. Pavlick, H. Scholtz, and D. R. Rushneck.
Journal of Environmental Science and Health (A), Vol 15, No 5, Special Issue, p 513-523, 1980. 5 Fig, 8 Ref.

Descriptors: *Gas chromatography, *Pollutant identification, *Waste water(Pollution), *Separation techniques, Analytical techniques, Water-analysis, Hydrogen ion concentration, Mass spectrometry, Water pollution sources, Water chemistry, Chemical analysis, Sodium sulfate.

Gas chromatographic analysis of pollutants in waste waters may be complicated by the difficulty of separating the pollutant from the complicated matrices that can occur in process waste streams After direct aqueous injection and microextraction have been performed to detect the compound of interest and it has been determined that interference exists, the simplest method to reduce this is to examine the relationship of the pH of the sample and interference. It the latter is pH sensitive and the compound is not, exchanging the pH of the water usually eliminates interference. If the reverse is true, column chromatography usually retards the compound, while the interference is eluted and discarded. A microcleanup technique, in which microextracts are subjected to Florisil column chromatography, may be used. This method requires 1-1/2 cm Pr-grade Florisil (180 mg) with 2 cm sodium sulfate in a disposable Pasteur pipette An aliquot of the microextract (0.5 milliliter) is placed on the column and eluted with 2 milliliters of hexane. The column is then eluted with 2 milliliters of 20% ether in hexane, and the eluate analyzed for polar compounds. Other techniques are useful for reducing interferences in the case of particular compounds. Certain interferences may require cleanup by molecular weight distribution, separation by capillary columns, or the use of precolumns and back-flushing techniques. The analytical method is verified by spiking, a recovery of 50-150% of the spike validating the method. It is possible, using such techniques, to solve nearly every interference problem without resorting to mass spectrometry. (Gish-FRC)

MUTAGENICITY IN SALMONELLA OF FLUORESCENT DYE TABLETS USED IN WATER TRACING,
Health and Welfare Canada, Ottawa (Ontario). Environmental and Occupational Toxicology Div.
E. R. Nestmann, D. J. Kowbel, and J. Ellenton.
Water Research, Vol 14, No 7, p 901-902, July, 1980. 1 Fig, 13 Ref.

Descriptors: *Fluorescent dye, *Toxicity, *Tracking techniques, Bioindicators, Water pollution, Salmonella, Public health, Tracers, Mutagens, Bacteria

Red and yellow/green fluorescent dye tablets currently used for water tracing were evaluated for their mutagenicity to five strains of Salmonella typhimurium. Rhodamine B and Uranine containing dyes were tested using the Ames procedure for bacterial His(+) revertants in the presence or absence of S9 mix. Red tablets containing Rhodamine B increased the number of His(+) revertant colonies in strains TA1538 and TA98 in the presence of S9 in a dose-dependent manner. Fluorescent yellow/green tablets containing Uranine (Fluorescein Sodium) showed no mutagenic activity in any of the strains tested. Since these dyes are available for commercial, public, and field use in sewage, plumbing, and water pollution tracing, it was recommended that in vivo mutagenicity/carcinogenicity studies be performed to assess possible hazards of these products to humans. (Geiger-FRC)

5B. Sources Of Pollution

THE INFLUENCE OF P-RETENTION BY SOILS AND SEDIMENTS ON THE WATER QUALITY OF THE LIONS RIVER,
H. D. Furness, and C. M. Breen.
Journal of the Limnological Society of Southern Africa (Bloemfontein), Vol 4, No 2, p 113-118, 1978. 1 Fig, 6 Tab, 30 Ref.

Descriptors: *Phosphorus compounds, *Soils, *Sediments, *Retention, *Water quality, Nutrient removal, Leaching, Rivers, Fluvial sediments, Phosphates, Fertilizers, Runoff, Watersheds(Basins), Eutrophication, Movement, Suspended solids, Evaluation, Particle size, Soil texture, Sands, Aluminum, Mathematical studies, Correlation analysis, Algae, Nitrogen compounds, South Africa, *Lions River(South Africa), *Midmar dam catchment(South Africa).

The impact of phosphorus-retention by soils and sediments on the concentration of phosphorus in the water of the Lions River, Midmar dam catchment area, South Africa, is reported. The amount of phosphorus added to the catchment area was estimated by fertilizer sales and the river sediment and water samples from six sites were analyzed for pH, P04-P, total-P, Al, and cation concentrations. The amount of P-retention by the specific soils was reduced when more fertilizer had been applied, even though all soils have high P-retention properties. This may be due to saturation of the Al sites of the soil particles which bind phosphorus. The P-retention ability was also found to be dependent on the sediment texture, with sand having the least ability and clay having the best. There is a significant negative correlation between pH and Al (3+) concentration. The concentrations of P04-P in the water possibly reflects an equilibrium between the sediment and the water and if the pH of the sediment decreased, more P would be liberated into the water. The P retention properties of the soils will keep P concentrations from the Lions River low and not much P04-P will reach the Midmar dam. Nitrogen is probably the limiting factor for algae growth in the dam, not phosphorus. (Sidney-IPA)

WATER QUALITY DEGREDATION DUE TO NON-POINT POLLUTION FROM URBAN SOURCES,
Delaware Univ., Newark. Dept. of Civil Engineering.
J. B. Carberry.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-124364, Price codes: A05 in paper copy, A01 in microfiche Final report, January 1980. 62 p, 17 Fig, 14 Tab, 105 Ref. OWRT-B-018-DEL(3), 14-34-0001-8070.

Descriptors: *Lead, *Cadmium, *Water pollution sources, *Delaware, Automobiles, Storm runoff, Rain gages, Atomic adsorption, Bottom sediments, Solubility, Hydraulic models, Stochastic processes, Water sampling, Adsorption.

A study of the concentrations of cadmium and lead in the Christiana River in the Newark, Delaware, area showed that lead pollution originates from airborne automotive exhausts, while cadmium pollution originates from surface stormwater runoff Four complete storm events were sampled for streamwater degredation analysis at five different sampling stations. Six storms were sampled for rainwater only. Rain-guages consisted of 1000 ml graduated cylinders topped with 8-inch diameter funnels. A portable Beckman pH meter was used for pH determinations and lead and cadmium concentrations were determined by atomic adsorption All streamwater samples were grab samples. Rainwater pH showed a temporal variation for a storm event with increasing pH controlling the lead concentration, while cadmium did not exceed any possible solubility of pH-controlled precipitation Lead was found to be associated with stream sediments while cadmium remained soluble. Stream sediments and soils suspended during a storm event have significant adsorption capacity. Hydraulic dispersion and stochastic models are used to describe stream responses to storm events. NUTRIENT YIELD OF THE APALACHICOLA RIVER FLOOD PLAIN, FLORIDA: RIVER-QUALITY ASSESSMENT PLAN,
Geological Survey, Tallahassee, FL. Water Resources Div.
H. C. Mattraw, Jr., and J. F. Elder.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-103590, Price codes: A03 in paper copy, A01 in microfiche. Geological Survey Water-Resources Investigations 80-51, 1980. 21 p, 3 Fig, 1 Tab, 29 Ref.

Descriptors: *Nutrients, *Rivers, *Flood plains, *Wetlands, Detritus, River flow, Sampling, Measurement, Vegetation, Trees, Distribution patterns, Decomposing organic matter, Surface-groundwater relationships, Trace elements, Pesticides, *Florida, Remote sensing, *Apalachicola River(FL), *River quality

The Apalachicola River in northwestern Florida is the location of one of four current U.S. Geological Survey National River Quality Assessments. The investigation of the Apalachicola River and flood plain is designed to quantify the organic detritus and nutrient yield to the productive, estuarine Apalachicola Bay. The extensive riverine flood plain is subject to seasonal flooding which transports large quantities of accumulated, decaying leaf litter from the flood plain into the river and ultimately into Apalachicola Bay. The Apalachicola River Quality Assessment has four major objectives; (1) Determine the accumulation of organic substances and trace elements in benthic organisms and fine-grained sediments; (2) Define the distribution of the major tree communities on the flood plain; (3) Assess the role of leaf fall and decomposition on nutrient yield; and (4) Identify and quantify major sources and pathways of nutrients to the river. Extensive emphasis is given to investigation approaches and techniques to facilitate technology transfer to similar wetland ecosystems. (USGS)

Descriptors: *Model studies, *Dissolved oxygen, *Waste assimilative capacity, *Water quality, *Indiana, Streams, Streamflow, Low flows, Reaeration, Water pollution, Waste water disposal, Waste water treatment, Biochemical oxygen demand, Nitrification, Ammonia, Nitrates, Nutrients, Mathematical models, *Huntington County(IN), *Wabash River(IN).

A digital model calibrated to conditions in the Wabash River in Huntington County, Ind., was used to predict alternatives for future waste loadings that would be compatible with Indiana stream water-quality standards defined for two critical hydrologic conditons, summer and winter low flows. The major point-source waste load affecting the Wabash River in Huntington County is the Huntington wastewater-treatment facility. The most significnt factor potentially affecting the dissolved-oxygen concentration during summer low flows is nitrification. However, nitrification should not be a limiting factor on the allowable nitrogenous and carbonaceous waste loads for the Huntington wastewater-treatment facility during summer low flows if the ammonia-nitrogen toxicity standard for Indiana streams is met. The disolved-oxygen standard for Indiana stream, an average of 5.0 milligrams per liter, should be met during summer and winter low flows if the National Pollution Discharge Elimination System's 5-day, carbonaceous biochemical-oxygen demands of a monthly average concentration of 30 milligrams per liter and a maximum weekly average of 45 milligrams per liter are not exceeded. A PRACTICAL LAGRANGIAN TRANSPORT MODEL,
Geological Survey, NSTL Station, MS. Water Resources Div.
H. E. Jobson.
Available from OFSS, USGS, Box 25425, Fed. Ctr., Denver, CO. 80225, Paper copy $4.50, microfiche $3.50. Geological Survey open-file report 80-206, 1980. 31 p, 7 Fig, 8 Ref.

Descriptors: *Computer models, *Model studies, *Streamflow, *Riverflow, *Dye releases, Tracers, Tracking techniques, Dispersion, Unsteady flow, Water temperature, Mathematical models, Georgia, *Chattahoochee River(GA), *Transport modeling.

An unconditionally stable and practical transport model for use in upland streams and rivers has been developed and verified. Basing the model on the Lagrangian, rather than the Eulerian, reference frame greatly reduces the numerical problems associated with solving the advective terms of the convective-diffusion equation. The model contains almost no numerical dispersion, is conceptually simple, and is relatively easy to code. Model results closely simulated dye concentrations measured in the Chattahoochee River near Atlanta, Ga. under highly unsteady flow conditions. (USGS)

CONTENT AND DISTRIBUTION PATTERNOF 2, 4-D IN THE RED RIVER,
Saskatchewan Dept. of the Environment, Regina. Inland Waters Directorate.
V. T. Chacko, and W. D. Gummer.
Technical Bulletin No. 115, 1980. 12p, 3 Fig, 13 Ref, 9 Tab.

Descriptors: *Water pollution, *Herbicides, *2, 4-dichlorophenoxyacetic acid, *Contaminants, *Agriculture, *Surveys, *Snalyses, Surface water, Aquatic environment, Red River, Manitoba, Canada, Path of pollutants.

Distribution of the herbicide 2, 4-D in the Red River between Emerson and Netley Lake was studied. The herbicide was found primarily in the water, less on the suspended sediment and not detectable in the bottom sediments and benthos. The recorded high concentration of 2, 4-D in February 1977 that prompted this study is believed to be derived in part from the effluent of the City of Winnipeg's North End Pollution Control Center, which was found to contain 30 500 ng/L 2, 4-D. There is no measurable accumulation of 2, 4-D in the deposited river sediment. This report also addresses (1) the variability of 3, 4-D concentrations attributed to the sampling technique, (2) the river cross-sectional heterogeneity and (3) the sample preservation technique. (WATDOC)

DEVELOPMENT OF AN OIL SPILL MODEL FOR THE ST. LAWRENCE RIVER,
Inland Waters Directorate, Ottawa (Ontario).
M. Fingas, and M. Sydor.
Technical Bulletin No 116, 1980. 25 p, 9 Fig, 32 Ref.

Descriptors: *St. Lawrence River, *Computer models, *Oil spills, *Water pollution, Path of pollutants, Hydrocarbons, Transport, Spill behaviour, Blo-ker's model, Fay's model, Simulation analysis.

The use of modelling to simulate the behaviour of spilled hydrocarbons under varying natural conditions is improving man's understanding of his environment. This report reviews some of the history of oil spill modelling and discusses many of the factors that must be considered in plotting the behaviour of bunker crude oil on the water surface. The report details procedures taken in developing an oil spill simulation model for the St. Lawrence River. (WATDOC)

OCCURRENCE OF HERBICIDE OXADIAZON IN SURFACE WATERS AND TAP WATER,
Kitakyushu Municipal Inst., of Environmental Health Sciences (Japan).
Y. Yamato, and M. Suzuki.
Water Research, Vol 14, No 10, p 1435-1438, October, 1980. 4 Fig, 3 Tab, 13 Ref.

Descriptors: *Surface waters, *Potable water, *Pesticide kinetics, *Oxadiazon, Herbicides, Gas chromatography, Mass spectrometry, Agricultural runoff, Rivers, Reservoirs, Japan, Water sampling, Seasonal, Pesticide residus.

The occurrence of oxadiazon in surface and tap water was investigated by gas chromatographic analyses of water samples taken from one Japanese tap water source, four Japanese rivers, and one Japanese reservoir. Positive identification of oxadiazon was confirmed by mass spectrometry. All samples taken monthly from April to February from the Tonda Reservoir site contained oxadiazon (range, 0.007 ppb in April to 0.304 ppb in August). In tap water, maximum levels of oxadiazon were found in July (0.093 ppb). High concentrations of oxadiazon residues were found after the beginning of rice seedling transplantation at the Higashitani, Nishitani, and Murasaki River sites, (June: 1.1953, 1.156, and 1.075, respectively) after which they rapidly decreased. At the Onga River site, oxadiazon levels ranged from 0.009 ppb in May to 0.445 in July. Oxadiazon residues ranged from 0.001 to 1.953 ppb from all sources tested, with levels in tap water being approximately 3-23% of those in raw water. (Geiger-FRC)

ARSENIC CYCLING IN MARINE SYSTEMS,
Woods Hole Oceanographic Institution, MA.
J. G. Sanders.
Marine Environmental Research, Vol 3, No 4, p 257-266, September, 1980. 2 Fig, 2 Tab, 40 Ref.

Descriptors: *Arsenic compounds, *Continental shelf, *Sediments, *Path of pollutants, Aquatic environment, Rivers, Saline water intrusion, Georgia, Gulfs, Sea water, Atmosphere, Water pollution, Southeast U.S.

The arsenic cycle and recent advances in its study are reviewed with special attention given to the major reactions of arsenic in the continental shelf area of the Georgia Bight. Arsenic is uniformly distributed throughout the marine environment with some concentration in coastal areas due to anthropogenic additions. It occurs naturally in oceans in several oxidation states and often enters into reactions with marine biota. The cycle of arsenic in marine sediments is not well known. The rivers of the southeastern portion of the United States supply little arsenic to the Georgia Bight through runoff waters (10,000 kg/yr according to one investigator). Atmospheric arsenic is a very minor contributor to the arsenic levels of the Georgia Bight (13,000 kg/yr). Diffusion from sediments amounts to 4,800 kg/yr. Arsenic in rainfall in the vicinity of emissions may contain elevated levels of arsenic. The residence time for arsenic in Bight waters is approximately 3 months. Arsenic entering the Bight is largely dissolved as opposed to particulate. The major input of arsenic into the Bight is by way of intrusion subsurface Gulf Stream waters (4 million kg/yr). Changes in arsenic speciation occur by indiscriminate biological uptake involving about 20% of the dissolved arsenate pool and producing measurable levels of methylated and reduced species. Although the overall cycle of arsenic resembles the phosphate cycle, the regeneration period for arsenic is much longer. (Geiger-FRC)

BEHAVIOUR OF HCH (1,2,3,4,5,6-HEXACHLOROCYCLOHEXANE) RESIDUE IN THE AQUATIC ENVIRONMENT,
Kitakyushu Municipal Inst. of Environmental Health Sciences (Japan).
Y. Yamato, M. Suzuki, K. Shimohara, and T. Akiyama.
Water Research, Vol 14, No 3, p 247-251, March, 1980. 4 Fig, 2 Tab, 16 Ref.

Descriptors: *Chlorinated hydrocarbon pesticides, *Surface waters, *Pesticide kinetics, Gas chromatography, Rivers, Reservoirs, Agricultural runoff, Persistence, Runoff forecasting, Sampling, Seasonal, Water pollution sources.

Knowledge of the behavior of organochlorine pesticides in surface waters is helpful in evaluating the contamination of field soils with these components. To this end, surface water samples taken monthly for 1 yr from five sites in Japan representing three rivers and one reservoir were analyzed for levels of 1,2,3,4,5,6-hexachlorocyclohexane (HCH) by gas liquid chromatography. Equations of the waves derived from plotting log concentrations of HCH against time were calculated from monthly variations at each sampling site. At all five sites, HCH was found in higher levels during the summer and at lower concentrations in the winter. At the river sites, maximum HCH concentration was found in August. This was thought to be due to HCH residing in paddy field soils that flowed out with repeated flooding. Of all the sampling sites, the amplitude of the wave described by the data from the reservoir was the smallest. The slope of the wave at a downstream sampling site was smaller than that at a site upstream on the same river. Projected maximum total HCH concentra-

tions for 1985 show that levels at the upper stream will be about a hundredth or a thousandth of those downstream. Estimates for the five sites for 1985 ranged from .0000015 to .003 ppb HCH. Equations also showed that beta-HCH was more persistent than gamma-HCH in surface water. Estimates for 1985 indicated that the ratio of beta-HCH to total HCH in surface water would be approximately 60%. (Geiger-FRC)

MOVEMENT OF 2,4,5-T THROUGH LARGE SOIL COLUMNS,
New Mexico State Univ., Las Cruces. Dept. of Agronomy.
G. A. O'Connor, P. J. Wierenga, H. H. Cheng, and K. G. Doxtader.
Soil Science, Vol 130, No 3, p 157-162, September, 1980. 7 Fig, 16 Ref.

Descriptors: *2,4,5-T, *Soil water movement, *Tritium, *Computer models, Chlorinated hydrocarbon pesticides, Herbicides, Pesticides, Clay loam, Soils, Pesticide kinetics, Adsorption, Biodegradation, Flow, Sorption, Greenhouses, Path of pollutants, Irrigation.

The movement of tritiated waters and 2,4,5-T, an herbicide, through large soil columns was investigated. Adsorption in Glendale clay loam conformed to the Freundlich relationship up to an equilibrium herbicide concentration of about 20 micrograms/ml. Desorption studies indicated more hysteresis than previously reported. Degradation studies confirmed the relatively slow biological degradation of 2,4,5-T previously reported. One study indicated that 2,4,5-T applied at 80 micrograms/ml remained in Glendale soil for about 85 days in large soil columns under similar greenhouse conditions. Predicted and observed tritium concentrations in both the effluent and inside the column were used to evaluate the ability of a computer model to simulate transient state water flow in soil. The model incorporated both the adsorption-desorption and biological degradation processes. The model successfully predicted tritiated water distributions after several irrigations. Predicted and observed distribution of the herbicide over the first few days were closely similar, indicating the effectiveness of the model. Movement of the sorbable herbicide was retarded in relation to the movement of the water in which it was dissolved. However, movement of the herbicide through the soil after the second and third irrigations was not adequately described by this model. No 2,4,5-T was found in the drainage from the soil columns. (Baker-FRC)

LEACHING LOSSES OF TWO NUTRIENTS AND AN HERBICIDE FROM TWO SANDY SOILS DURING TRANSIENT DRAINAGE,
Florida Univ., Gainesville. Dept. of Soil Science.
R. S. Mansell, W. B. Wheeler, and D. W. Calvert.
Soil Science, Vol 130, No 3, p 140-150, September, 1980. 8 Fig, 5 Tab, 13 Ref.

Descriptors: *Potassium, *Nitrogen compounds, *Herbicides, *Leaching, *Sprinkler irrigation, Pesticides, Irrigation, Flow, Subsurface waters, Drainage, Soil water, Cultivation, Rainfall, Nutrients, Nitrates, Nitrification, Water table, Soil types, Acid soils.

Shallow-tilled (ST) and deep-tilled (DT) plots of an acid, sandy soil were used to measure changes in potassium, nitrogen nitrates, and Terbacil concentrations in subsurface drainage water from the plots. Fertilizer (equivalent to 35.18 kg/ha K, 19.07 kg/ha NO3-N, and 23.31 kg/ha NH4-N) and Terbacil herbicide (4.5 kg/ha) was applied to the soil. Transient water flow was applied to the plots for a 2-wk period after 7.6 cm of irrigation had been achieved. Rainfall occurred 10, 11, and 12 days after fertilizer and Terbacil application (total water, 4.8 cm). ST drainage water contained higher concentrations of all solutes than did DT drainage water. In ST soils, the water table rose to within 100 cm of the surface during sprinkler applications of water, whereas in DT the water table rose to within 60 cm. In the DT soil, the discharges of potassium, nitrogen producing nitrates, and Terbacil were only 29.6, 37.0, and 13.9%, respectively as large as those in the ST soil. This was due to the slower drainage, higher soil-water contents, and higher clay content and organic matter present in the upper 60 cm of the DT soil. Total cumulative drainage from DT soil was only 51.1% that from ST soil. Thus, relatively small quantities of irrigation and rainfall produced relatively large nutrient discharges. As irrigation was begun soon after fertilizer application, the leaching loss of these solutes would be expected to be greater than if water application had occurred later. (Baker-FRC)

BEHAVIOUR OF 12 INSECTICIDES IN SOIL AND AQUEOUS SUSPENSIONS OF SOIL AND SEDIMENT,
Malaysian Agricultural Research and Development Inst., Selangor.
M. S. Sharom, J. R. W. Miles, C. R. Harris, and F. L. McEwen.
Water Research, Vol 14, No 8, p 1095-1100, August, 1980. 6 Fig, 4 Tab, 15 Ref.

Descriptors: *Sediments, *Soils, *Pesticide kinetics, *Insecticides, *Path of pollutants, Chlorinated hydrocarbon pesticides, Organophosphorus pesticides, Leaching, Carbamate pesticides, Adsorption, Stream erosion, Soil types, Organic soils, Loam, Sands, Absorption, Solubility, DDT, Dieldrin, Diazinon

Pesticides and their degradation products may enter the aquatic environment by leaching directly to streams or ground waters or by erosion of contaminated soils into streams. Once in an aquatic environment, the more adsorptive compounds will adhere to the sediments. The behavior of 12 insecticides representing the organochlorine, organophosphorus, and carbamate groups was tested in soil and in aqueous suspensions of soil and a stream sediment under laboratory conditions. Adsorption onto soil followed the order DDT > leptophos > dieldrin > endrin > ethion > chlorpyrifos > lindane > parathion > diazinon > carbaryl > carbofuran > mevinphos. The absorption of insecticides to soil or sediment was in general inversely correlated with the solubility of the insecticide in water. The absorptive capacity of the soils and sediments for the insecticides followed the order organic soil > stream sediment > Beverly sandy loam > Plainfield sand. Mobility and desorption of insecticides was found to increase with the solubility of the insecticide in water. These findings indicate that the water solubility properties of the insecticide and the nature of the adsorbents play a greater role than compound structure in determining the adsorption, desorption, and mobility behavior of an insecticide in soil and water. (Geiger-FRC)

5C. Effects Of Pollution

ENVIRONMENTAL IMPACT OF A NUCLEAR PLANT ON MISSISSIPPI RIVER BIOTA IN AN ECOLOGICAL RECOVERY ZONE NEAR RED WING, MINNESOTA,
Saint Mary's Coll., Winona, MN. Dept. of Biology.
L. J. Dieterman, and D. R. Mc Conville.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-120610. Price codes: A13 in paper copy, A01 in microfiche. Final Report submitted to Office of Water Research and Technology (1980), 269 p, 55 Fig, 66 Tab. OWRT-C-4343(No 9051)(1), 14-31-0001-9051.

Descriptors: *Thermal pollution, *Biota, Water pollution, Telemetry, Fluorometry, *Fish behavior, *Mississippi River, Fish movement, Population dynamics, Phyto-, Benthos, Macrophyte, *Nuclear powerplants, *Minnesota, Red Wing(MN).

The biota of the Mississippi River in an ecological recovery zone near Red Wing, MN was studied before and after start-up of a nuclear plant to acquire baseline data and to estimate changes due to thermal addition. Thermal addition produced significant decreases in primary production in a plant region during summer month periods when water temperatures were near 36 degree C. Other regions were not affected due to eutrophic waters and efficient mixing of large water volumes. Extensive fisheries studies and sonar tagging/tracking of S. vitreum were performed. Comparison of fisheries results with other riverine, lake, and pond studies indicated a favorable environment for the success of the fish species studied. Qualitative macroinvertebrate surveys were conducted. The area supports a large and diverse macroinvertebrate community characteristic of a healthy freshwater stream. River modifications in the recycle canals produced a unique acquatic ecosystem. Macroinvertebrate population differences in this region were noted.

IMPACT OF IRON DISCHARGES FROM WASTEWATER TREATMENT PLANTS ON ALGAL GROWTH AND SPECIES COMPOSITION,
State Univ. of New York Coll. at Fredonia. Environmental Resources Center
T. A. Storch, and V. L. Dunham.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-120602, Price codes: A06 in paper copy, A01 in microfiche. Center for Environmental Research, Cornell University, Ithaca, New York. Completion Report, October 1980. 104 p, 40 Fig, 19 Tab, 36 Ref. OWRT-B-074-NY(2), 14-34-0001-8102.

Descriptors: *Algae, *Chlorophyts, Algal bioassays, Algal metabolism, Blue-green algae, Green algae, *Iron, Nitrogen metabolism, Nitrification, Photosynthesis, Community composition, *Waste water(Pollution), Effects, Plant growth, *Phytoplankton, *Lake Erie, *Chautauqua Lake(NY), Anabaena flos-aquae, Scenedesmus bijugatus, Selenastrum capricornutum, Nitrate reductase, Nitrite reductase, Glutamine synthetase.

Unialgal cultures and lake assemblages of phytoplankton were studied to determine the effect of iron enrichment on algal metabolic processes and community composition. Phytoplankton assemblages from Lake Erie and Chautauqua Lake, N.Y. were generally inhibited following enrichment with unchelated iron. The degree of inhibition in lake water was small and it occurred as a result of extracellular interactions between iron and soluble ions (phosphorus and possibly some trace metals). Increases in photosynthesis following the addition of EDTA-chelated iron to lake water was shown to result primarily from the effect of EDTA alone on algal metabolism. Lake diatom populations appeared to be the most sensitive to iron. However, iron enrichment did not enhance lake populations of blue-green algae nor did it cause major shifts in the composition of the phytoplankton community. Investigations with defined nutrient media indicated that iron enrichment stimulated the growth of unialgal cultures primarily only in nutrient-rich media. Under iron limiting conditions, iron enhanced cellular growth, photosynthesis and chlorophyll a content in both green and blue-green algae. Iron also stimulated the enzymes (nitrate and nitrite reductase and glutamine synthetase) involved in nitrogen metabolism in blue-green algae, but inhibited their activity in green algae. Iron was also observed to be important in the early stages of heterocyst formation by blue-green algae.

EFFECTS OF WATER-BORNE MIREX ON THE SURVIVAL AND PRODUCTION OF MACROBRACHIUM ROSENBERGII (DE MAN),
Clemson Univ., SC
A. G. Eversole.

Available from the National Technical Information Service, Springfield, VA 22161 as PB81-124091, Price codes: A04 in paper copy, A01 in microfiche. Water Resources Research Institute, Clemson University. Technical Report No 88, June 1980. 44 p, 6 Fig, 16 Tab, 29 Ref. OWRT-B-115-SC(1).

Descriptors: *Water pollution effects, *Aquiculture, *Pesticides, *Crustaceans, Bioassay, Gas chromatography, Pesticide toxicity, *Mirex, Prawns, Macrobrachium rosenbergii, Chlorinated hydrocarbons, Shrimp.

Water-borne mirex, in concentrations above 100 microg/l, was lethal to postlarval Macrobrachium rosenbergii in a 24-hour exposure acute toxicity experiment. Adult and juvenile prawns did not show a clear relationship between survival and concentration when exposed to mirex in water for 24 hours. Postlarvae exposed to mirex in water for 96 hours, with 10 prawns per test container, exhibited reduced survival with increasing mirex concentration. Individually exposed postlarvae (96 hours) did not exhibit such a distinct mortality pattern. A significant increase in length of molt intervals with increasing concentration was found for postlarvae individually exposed to mirex in water for 96 hours. Potential production figures, calculated from data for prawns individually exposed indicate an increase in production (wet weight) of controls 2.24 and 1.70 times that of prawns exposed to 100 and 10 microg/l, respectively. Mirex residues in the tested postlarvae generally increased with increasing mirex concentration. Residues of mirex in postlarvae exposed to mirex for 24 hours (no food was present during the exposure period) suggest that M. rosenbergii can absorb mirex from the surrounding water. Water samples showed a marked decrease in mirex residues after 96 hours.

SECONDARY FIBRES PULPING/DEINKING EFFLUENT TOXICITY STUDY,
Beak Consultants Ltd., Vancouver (British Columbia).
Environmental Protection Service, Ottawa, Ontario, Canada, Water Pollution Control Directorate.
Economic and Technical Review Report EPS 3-WP 79-6, 1979. 37 p, 16 Tab, 22 Ref.

Descriptors: *Pulp wastes, *Effluents, *Analyses, *Bioassay, *Toxicity, Heavy detergents, Pulp washing(Deink), Characteristics, Treatment, Sampling, Canada.

The effluents from five integrated secondary fibre pulping (SPP)/deinking mills located in the north mid-western United States and Eastern Canada were sampled for toxicity during the period November 1977 to February 1978. The untreated effluent from the SFP/deinking mills was found to be toxic and it was determined that the toxicity was contributed by the pulp washing (deinking) effluent stream. Contributors to toxicity found in the deinking effluent included: fibre, alkaline pH, polychlorinated biphenyls (PCBs), heavy metals and detergents. No correlation was established between changes in the individual toxicant concentrations and the variations in effluent toxicity. The pulp washing stream contained both a foam and a liquid fraction. The foam fraction exhibited much higher toxicity and contained higher concentrations of toxicants than the liquid portion. Settling of the pulp washing effluent prior to bioassay testing reduced toxicity, while setting of the untreated toal mill effluent did not significantly reduce toxicity. The deinking process is fully described, as are the defibering processes at each mill. A brief review of the literature is also presented. (WATDOC)

THE POTENTIAL FOR NITROGEN FIXATION IN A LAKE RECEIVING SEWAGE EFFLUENT (GRASMERE, ENGLISH LAKE DISTRICT),
Freshwater Biological Association, Ambleside (England).
K. L. Jones, J. V. Roscoe, and J. G. Jones.
Journal of Applied Bacteriology, Vol 49, No 1, p 143-154, August, 1980. 6 Fig, 3 Tab, 37 Ref.

Descriptors: *Water sampling, *Lakes, *Sewage effluents, *Nitrogen fixing bacteria, Sediments, Seasonal, Nitrogen, Dissolved oxygen, Epilimnion, Hypolimnion, Cores, Nitrogen fixation, Thermal stratification, Ammonium compounds, Reduction(Chemical), Water pollution, Analytical techniques.

The potential for nitrogen fixation in the sediment and water column was studied at three sites in Grasmere, a lake in the English Lake District. The light-independent acetylene-reduction technique was employed for samples taken at different seasons, and at sites with varying levels of inorganic nitrogen and dissolved oxygen in the epilimnion and hypolimnion. Most probable number (MPN) counts of nitrogen fixing bacteria were carried out on glucose-supplemented medium for non-photosynthetic organisms and on ASM medium for cyanobacteria. Differences within a sediment core and between cores, and the method and medium for MPN determinations of potential nitrogen fixers were studied in preliminary investigations. Good correlations were found between potential rates of nitrogen fixation and MPN counts of nitrogen-fixing bacteria and between these parameters and decreases in levels of dissolved oxygen. During the period of thermal stratification, selective changes in the nitrogen-fixing microflora seemed to occur. Light-dependent fixation and cyanobacteria were undetectable in the water column. Acetylene reduction was found for most of the season in samples of water and sediment to which a carbon and phosphorus source have been added. It was concluded that sewage effluent has changed the nitrogen cycle and suppressed nitrogen fixation in Grasmere by increasing the level of ammonium throughout the lake, and by general enrichment. CANCER INCIDENCE AND TRIHALOMETHANE CONCENTRATIONS IN A PUBLIC DRINKING WATER SYSTEM,
Arkansas Univ. Medical Sciences Campus, Little Rock. Div. of Biometry.
G. L. Carlo, and C. J. Mettlin.
American Journal of Public Health, Vol 70, No 5, p 523-525, May, 1980. 2 Tab, 1 Ref.

Descriptors: *Potable water, *Chlorination, *Public health, Municipal water, Halomethanes, Cancer, New York, Water supply, Water sources, Groundwater, Surface waters, Water quality, Toxins, Epidemiology.

Consideration was given to 4,255 cases of esophageal, stomach, colon, rectal, bladder, and pancreatic cancers reported in Erie County to the New York State Tumor Registry between 1973 and 1976. A relationship was sought between cancer incidence and the concentration of trihalomethanes, by-products of chlorination, present in the various drinking water supplies. Control variables were socio-economic status, mobility, percent nonwhite, and urbanicity. Water source was divided into two types: surface (lake, river, reservoir) and ground (well, spring). A positive association was found between surface water as the source of supply and the incidence of esophageal and pancreatic cancer (Pearson correlation coefficient, r, $= -0.16$, $p < 0.05$). A positive correlation was also found between concentrations of trihalomethanes and the incidence of pancreatic cancer among white males ($p < 0.05$). However, for the total population studied, levels of trihalomethanes were not correlated with cancer incidence of any site. (Baker-FRC)

MUTAGENIC ACTIVITY IN DRINKING WATER,
Tulane Univ., New Orleans, LA. Dept. of Environmental Health Sciences.
N. Gruener, and M. P. Lockwood.
American Journal of Public Health, Vol 70, No 3, p 276-278, March, 1980. 1 Tab, 10 Ref.

Descriptors: *Potable water, *Mutagens, *Carbon, Total organic carbon, Laboratory tests, Laboratory animals, Public health, Municipal water, Cytological studies, Louisiana, Toxins, Water pollution sources, Water quality.

Samples of New Orleans tap water were concentrated through freeze drying, and the mutagenic and promoting activities of the water were tested by exposing Chinese hamster embryonic lung cells (V79) to the concentrated water for 2 hr. After exposure, cytotoxicity was determined by a reduction in plating efficiency compared with acetone-treated controls. Water samples containing only 140 mg/liter of total organic carbon (TOC) caused no mutagenic activity. However, a dose of 480 micrograms TOC from New Orleans drinking water caused a mutation frequency of 7.1 mutants/million surviving cells. It was calculated that the average daily intake of TOC through drinking water in New Orleans is 3,000 micrograms. Cells exposed to the potent promoter 12-O-tetradecanoyl-phorbol-13-acetate prior to exposure to the water demonstrated increased mutation frequencies. Tests on the water itself showed it to enhance benzo(a)pyrene mutagenicity approximately 100%. This may indicate that chemicals contaminating water can enhance carcinogenicity of other environmental factors such as air pollutants. The finding that water contains compounds which can directly or indirectly affect cellular DNA should be considered when bioassay carcinogenicity tests are designed. While these tests do consider the diet of the animals being studied, a little or no attention is given to the purity of their drinking water. (Baker-FRC)

LAKE WEEDS CAN BE CONTROLLED,
K. Grover.
American City and County, Vol 95, No 3, p 63-65, March, 1980. 4 Fig.

Descriptors: *Aquatic weed control, *Lakes, *Eutrophication, *Aging(Biological), Nutrients, Sewerage, Phosphates, Settling basins, Dams, Watershed management, Dredging, Weeds, Harvesting, Drawdown, Water levels, Nitrogen, Water pollution control, Herbicides, Farm ponds.

d control is to limit the nutrients entering a lake. While effective watershed management practices, including proper sewering, limited use of phosphates, and the development of siltation settling ponds and dams, will decrease the nutrient supply, these steps are not the major answer. At Vandalia, Missouri, dredging was used to remove 80,000 cu yards of silt and weeds in the city reservoir. Dredging at Long Lake, Michigan removed 840,000 cu ft of sediment, killed all weeds and improved recreational water uses. Problems involve cost and disposal of dredge spoil. Five cutters, eight weed transports and support machinery harvest 7,000-8,000 acres of water weeds each year in Dane County, Wisconsin. Lake level drawdown at Black Lake, Louisiana achieved 100% control of elodea and 78-100% control of fanwort. The use of herbicides is controversial. In Missouri, dichlobenil controlled weeds in farm ponds, but also caused a 70-100% increase in nitrogen and phosphorus concentrations due to decomposition of vegetation. Sediment covers placed on the bottom of lakes have been effective and provide immediate control. Biological control has been achieved through the use of snails, crayfish or the white amur. Bulletin of Environmental Contamination and Toxicology, Vol 25, No 3, p 358-363, September, 1980. 2 Tab, 19 Ref.

Descriptors: *Mayflies, *Stoneflies, *Acid mine water, *Respiration, Oxygen requirements, Toxicity, Mine wastes, Aquatic insects, Larvae, Water pollution effects.

Two species of Ameletus mayfly larvae (Ephemoroptera) and stonefly larvae (Plecoptera; Acroneuria xanthenes) were exposed to acid mine water for a period of 3 hr to measure the mine water's effect on oxygen consumption and respiratory rate. Median lethal time (LT50) values were determined by probit analysis, and oxygen consumption/hr was measured by calculations of regression coefficients by least squares. LT50 was 21.4 hr for A. lineatus and 29.0 hr for both Ameletus species. In each species the log transformation of oxygen consumption (microliters O2/g hr) was found to decrease with increasing individual dry weight. Oxygen consumption/unit weight, represented by a regression coefficient, differed from zero only for A. lineatus and A. xanthenes. Statistical comparisons betweeen regression coefficients obtained from sequential measurements of respiratory rates on solitary individuals showed that a majority of larvae exhibited similar rates regardless of the solution (control or acid mine water) to which they were exposed for second rate determinations. Intervention in the respiratory process by extraneous factors out of the scope of this experiment was suspected. Rates of osygen consumption for control and acid waters without test animals were negligible, showing the absence of bacterial contamination. It is concluded that the toxic mode of action of acid mine water did not operate through mechanisms that can be measured by respirometry (Geiger-FRC)

AMMONIUM INPUT TO THE SEA VIA LARGE SEWAGE OUTFALLS-PART I: TRACING SEWAGE IN SOUTHERN CALIFORNIA WATERS,
California Univ., San Diego, La Jolla. Inst. of Marine Resources.
W. H. Thomas, and A. J. Carsola.
Marine Environmental Research, Vol 3, No 4, p 277-289, September, 1980. 6 Fig, 1 Tab, 19 Ref.

Descriptors: *Ammonium compounds, *Phytoplankton, *Outfall sewers, *Tracking techniques, Sea water, On-site tests, Waste dilution, Pollutant identification, Coliforms, Turbidity, Chlorination, Baseline studies, Dissolved oxygen, Sewage treatment, Effluents, Water pollution sources, California, Sewage effluents.

High ammonium concentrations were found in sea water near large sewage outfalls off Southern California. This nutrient has potential use as a tracer of sewage discharge. Samples from seven or more depths were taken seasonally and monthly near three sewage outfalls. Turbidity, prevailing currents, and routine water quality parameters were measured. In June-July, ammonium levels were significantly higher than control levels (Camp Pendleton) at the White Point Outfall (30.2 mg-atom/sq m, 539% of control). In September-October, levels were significantly higher than the control at Hyperion Outfall (27.9 mg-atom/sq m, 3,390%) and Point Loma Outfall (5.3 mg-atom/sq m, 757%). In January-February, the corresponding figures were 85.6 mg-atom/sq m (465%) at Hyperion and 64.1 mg-atom/sq m (348%) at Point Loma. High ammonium levels were found associated with turbid layers, prevailing currents, detectable coliform bacteria (in one case only), and undersaturated dissolved oxygen concentrations. In addition, high concentrations of ammonium are associated with slowed phytoplankton assimilation rates linked to the inhibition of phytoplankton growth in outfall receiving waters. Use of ammonium as a tracer could also indicate the degree of dilution of sewage. However, it is dependent on adequate analytical methods and on sewage which has not received secondary treatment. (Titus-FRC)

AMMONIUM INPUT TO THE SEA VIA LARGE SEWAGE OUTFALLS - PART 2: EFFECTS OF AMMONIUM ON GROWTH AND PHOTOSYNTHESIS OF SOUTHERN CALIFORNIA PHYTOPLANKTON CULTURES,
California Univ., San Diego, La Jolla. Inst. of Marine Resources.
W. H. Thomas, J. Hastings, and M. Fujita.
Marine Environmental Research, Vol 3, No 4, p 291-296, September, 1980. 2 Tab, 11 Ref.

Descriptors: *Ammonium, *Dinoflagellates, *Phytoplankton, *Sea water, *Eutrophication, *Chlorination, Heavy metals, Growth rates, Photosynthesis, Laboratory tests, Marine algae, Toxicity, Diatoms, Outfall sewers, Effluents, California, Water pollution sources, Sewage effluents.

Tests were conducted on the effects of ammonium concentrations on the growth of six marine phytoplankton from Southern California which might be exposed to high ammonium levels in water near sewage outfalls, particularly the Whites Point outfall. Ammonium in concentrations up to 200 microgram-atom/liter was added to cultures of three diatoms (Asterionella japonica, Skeletonema costatum, Chaetocerus affinis), two dinoflagellates (Gymnodinium splendens, Gonyaulax polyedra), and an organism of the Dunaliella species. At concentrations of 150 and 200 microgram-atom/liter, growth rates were inhibited in the two dinoflagellate cultures. Photosynthesis was inhibited in Gymnodidium splendens at 100 and 200 microgram-atom/liter. This dinoflagellate is noteworthy as part of the anchovy food chain. Other phytoplankton were virtually unaffected. Levels of ammonium near sewage outfalls were found to lie mostly between 10 and 30 microgram-atom/liter, which would not inhibit phytoplankton growth. It is hypothesized that other factors such as heavy metals or chlorine compounds associated with chlorinated sewage may inhibit phytoplankton growth, and that ammonium may even be a factor contributing to eutrophication near sewage outfalls. POSSIBLE EFFECTS OF PHOSPHORUS ON ALGAL GROWTH IN BARTON BROAD AND RELATED CONTROL MEASURES,
Anglian Water Authority (England). Norfolk and Suffolk River Div
M. G. W. Bell, and F. H. Jones.
Water Pollution Control, Vol 79, No 2, p 177-194, 1980. 5 Fig, 10 Tab, 19 Ref.

Descriptors: *Phosphorus, *Nutrient removal, *Algal control, *Lakes, Eutrophication, River systems, Inland waterways, Sewage treatment, Water pollution control, Sewage effluents, Treatment facilities, Agricultural runoff, Bottom sediments.

Attempts to reduce the phosphorus levels in Barton Broad, Norfolk, England to a concentration which would support the coexistence of algae and higher plants are described. Barton Broad lies in the valley of the River Ant. Macrophyte growth in this broad has been attributed to eutrophication and dense phytoplankton blooms. Sewage effluents and drainage from agricultural lands provide nutrients to Barton Broad via the River Ant, however, these sources do not account for the 1,300 kg/yr of phosphorus which reaches the Broad. It was suggested that phosphorus entered from river beds, and studies to ascertain this were undertaken. Increased dissolved phosphorus levels were detected in bottom muds and were believed to be due to discharges from the sewage effluent sources at Stalham and North Walsham Sewage Treatment Works. Measurements of annual loadings of phosphorus at both sites indicated that reduction of phosphorus discharge at each site would be necessary to attain the target steady-state level of 100 micrograms P/liter in the Broad. The Stalham works were upgraded for increased phosphorus removal by using ferric sulfate, while innovations at the North Walsham plant were deferred in lieu of future plans for possible sea discharge. Over 90% phosphorus removal was achieved at Stalham, but the frequent monitoring required by the upgraded process will require further work. Discussions on phosphorus control work in the Broad follow this article. (Geiger-FRC)

THE WATER-FERN SALVINIA MOLESTA IN THE SEPIK RIVER, PAPUA NEW GUINEA,
Office of Environment and Conservation of Papua New Guinea, Port Moresby.
D. S. Mitchell, T. Petr, and A. B. Viner.
Environmental Conservation, Vol 7, No 2, p 115-122, Summer, 1980. 4 Fig, 4 Tab, 15 Ref.

Descriptors: *Ferns, *Aquatic weeds, *Lakes, *Lagoons, Nutrients, Phosphorus, Nitrogen, Rivers, Aquatic plants, Water resources development, Water pollution, Water pollution control, Fishkill, Governments, United Nations, Asia, Aquatic weed control.

The backwaters of the Sepik River between Pagwi and Angoram in Papua New Guinea have been heavily overgrown since 1977 with Salvinia molesta, an exotic water-fern that was introduced into the area in the early 1970s. Salvinia covered approximately 80 sq km by May of 1979 and the physico-chemical properties of lagoons and lakes of the Sepik River were investigated to determine the effects of nutrients on the ferns. Dissolved nitrogen and phosphorus did not show extreme concentrations when compared with other waters but did show an influence from Salvinia and other aquatic plants. Dissolved phosphate-phosphorus was only about 25% of that on the open Sepik near or under weed beds, while nitrate nitrogen values near or under weed beds were only about 10% of those of the open river. Examinations of the silt load of the Purari River to the south showed available phosphate phosphorus for plant metabolism. Overgrowth of Salvinia has caused declines in Saltfish Tilapia (Sarotherodon mossambicus) fisheries, crocodile hunting, and sago-palm collection. Blockage of waterways has hindered transportation and the development of tourism. Programs to manage the growth of Salvinia are being conducted by local, provincial, and central government and the United Nations; however, the complete elimination of the weed from the backwaters of the Sepik River does not seem likely. The overgrowth of the fern illustrates the danger of introducing exotic species into alien environments. (Geiger-FRC)

UPTAKE OF TRACE METALS BY THE CLAM MACOMA INQUINATA FROM CLEAN AND OIL-CONTAMINATED DETRITUS,
Battelle Pacific Northwest Lab., Sequim, WA. Marine Research Lab.
E. A. Crecelius, J. M. Augenfeld, D. L. Woodruff, and J. W. Anderson.
Bulletin of Environmental Contamination and Toxicology, Vol 25, No 3, p 337-344, September, 1980. 3 Fig, 3 Tab, 7 Ref.

Descriptors: *Clams, *Oil pollution, *Trace elements, *Sea water, Water pollution, Radioisotopes, Neutron activation analysis, Suspended solids, Aquatic animals, Metals, Chromium, Cobalt, Iron, Zinc, Detritus.

Clams (Macoma inquinata) were exposed to clean and oil-contaminated neutron-activated detritus (suspended matter in Sequim Bay water settled out in a laboratory flowing sea water system) for periods of 2, 4, 8 and 15 days to measure the uptake of tract metals by marine detritivors. After 15 days of exposure, depuration of the remaining clams was carried out in tanks filled with clean water and non-labeled detritus for 2 or 8 days. Uptake of Cr-51, Co-60, Eu-152, Fe-59, Sc-46, and Zn-65 was measured in clams and adjusted according to the rate of decay for each isotope to account for the time each sample was removed from the exposure tank. No difference was found in the quantity of Co released to sea water by oiled and non-oiled sediments. Co was the only metal which appeared consistently in sea water and clam shells at detectable levels. Cr, Eu, and Sc appeared in sea water sporadically, while Fe and Zn were not detected at all. Clams transferred to tanks with non-labeled detritus quickly lost radioactive material so that only 1-10% of the original radioactivity remained after 8 days. Cr was found in only three clam samples. Eu was not absorbed from the gut, and no evidence was found of Fe uptake. In general, less oiled than non-oiled detritus was ingested, making smaller amounts of labeled metal available for absorption across the walls of the intestinal tract.

There was no evidence that more Co was taken into the shells from oiled than from non-oiled detritus. (Geiger-FRC)

EFFECTS OF ROUNDUP HERBICIDE ON POPULATIONS OF DAPHNIA MAGNA IN A FOREST POND,
Northwest Ecological Animal Research Ltd., Vancouver (British Columbia).
L. D. Hildebrand, D. S. Sullivan, and T. P. Sullivan.
Bulletin of Environmental Contamination and Toxicology, Vol 25, No 3, p 353-357, September, 1980. 1 Fig, 1 Tab, 8 Ref.

Descriptors: *Daphnia, *Ponds, *Herbicides, Toxins, Toxicity, Aquatic animals, Aquatic life, Water pollution, Water pollution effects, Pesticides, Defoliants, Forests.

The toxicological effects of a range of concentrations of Roundup herbicide on populations of Daphnia magna were studied in a forest pond. Roundup is a commercial formulation containing 356 g/liter present as isopropylamine salt, and enters bodies of water through defoliation of vegetation in the treated area. The experimental pond measured 60 by 24 m and reached depths of 3-4 m. Plastic and nylon cylindrical pens (15 cm in diameter, 35 cm high) containing D. magna were suspended at four stations in the pond, each of which was treated with one of the following doses: 0 (control), field dose (2.2 kg/ha), 10x field dose, and 100x field dose. Population samplings were made on days 2, 4, and 8 after herbicide application. Herbicide treated D. magna populations showed no differences from control populations for all doses and exposure times examined (92-100% survival rate). The high survival rates of D. magna exposed to Roundup suggest that this herbicide had no detectable effect on this organism. (Geiger-FRC)

RELATIONSHIP OF PER CENT MORTALITY OF FOUR SPECIES OF AQUATIC BIOTA FROM 96-HOUR SEDIMENT BIOASSAYS OF FIVE LAKE MICHIGAN HARBORS AND ELUTRIATE CHEMISTRY OF THE SEDIMENTS,
Aqua Tech Environmental Consultants, Inc., Melmore, OH.
R. A. Hoke, and B. L. Prater.
Bulletin of Environmental Contamination and Toxicology, Vol 25, No 3, p 394-399, September, 1980. 4 Fig, 10 Ref.

Descriptors: *Biota, *Lake Michigan, *Sediments, *Mortality, Chemical analysis, Bioassay, Correlation analysis, Chlorides, Ammonia, Nickel, Aquatic life, Daphnia, Sampling, Dredging, Waste disposal, Toxicity.

Sediment grab samples were collected from five Lake Michigan harbors and were analyzed using bulk and elutriate chemical techniques as well as 96-hour sediment bioassays on four aquatic species. Bivariate correlations between the percent mortalities of Pimephales promelas, Hexagenia limbata, Lirceus fontinalis, and Daphnia magna and elutriate chemical data were performed by computer analysis. Of 60 bivariate correlation analyses conducted, 4 met the criteria established to identify a relevant correlation ($r = or > 40$, $p = 0.05$). The mortality of P. promelas was significantly correlated with the elutriate levels of chloride, and the mortality of H. limbata was significantly correlated with the elutriate levels of chloride, ammonia, and nickel. Previous investigations have shown greater numbers of significant correlations between mortality of test organisms and bulk chemistry of the sediments, suggesting that bulk sediment chemistry and bioassays may be more appropriate in assessing the impact of dredged material disposal on benthic species. TOXICITY OF A FUEL OIL TO THE EGGS OF PARHYALE HAWAIENSIS AND AMPHITHOE VALIDA (AMPHIPODA),
Texas Univ. at Austin, Port Aransas. Port Aransas Marine Lab.
W. Y. Lee, and J. A. C. Nicol.
Marine Environmental Research, Vol 3, No 4, p 297-305, September, 1980. 3 Fig, 1 Tab, 22 Ref.

Descriptors: *Amphipoda, *Oil, *Embryonic growth stage, *Juvenile growth stage, Toxicity, Growth stages, Mortality, Aquatic animals, Crustaceans, Water pollution, Oil pollution, Marine animals.

The toxicity of fuel oil to developing embryos and juveniles was studied in two marine amphipods, Parhyale hawaiensis and Amphithoe valida. Eggs of P. hawaiensis were selected at both early and late embryonic stages. Four concentrations (10, 20, 30, and 40%) of the water-soluble fraction (WSF) of No. 2 fuel oil were tested. For studies with A. valida, females bearing eggs in an early stage of development were exposed to concentrations of 10, 20, and 30% WSF. After 5 days, the females were sacrificed and the eggs examined for any changes indicative of fuel-oil toxicity. Eggs of P. hawaiensis were able to develop from early germinal disc stage to juvenile form in concentrations of WSF up to 40%. Among early eggs, there was greater mortality of embryos in WSF concentrations of 10-30% ($p < 0.01$); among late eggs, survival of embryos and juveniles was much greater (75% of eggs in 40% WSF hatched). However, compared with the control, there was a reduction in survival of late eggs at 30 and 40% WSF ($p < 0.01$). Juveniles hatched from early eggs died, mortality increasing with 20% WSF and above, and, at 40% WSF, no early eggs hatched. Toxicity varied with concentration and length of exposure. All young in 30 and 40% WSF died within 7 to 8 days. For studies with A. valida, toxicity was high at 20% concentrations and all embryos were killed at 30% WSF. It is suggested from these results that crustacean eggs enclosed in hard cases or shells may be more resistant to toxic petroleum oils than eggs surrounded only by fertilization and jelly membranes. EFFECTS OF PRUDHOE BAY CRUDE OIL CONTAMINATION ON SEDIMENT WORKING RATES OF ABARENICOLA PACIFICA,
Battelle Pacific Northwest Lab., Sequim, WA. Marine Research Lab.
J. M. Augenfeld.
Marine Environmental Research, Vol 3, No 4, p 307-313, September, 1980. 3 Tab, 1 Fig, 10 Ref.

Descriptors: *Sediment transport, *Oil pollution, *Feeding rates, *Indicators, *Worms, Turnovers, Sea water, Laboratory tests, Environmental effects, Organic compounds, Water pollution sources, Intertidal areas, Aquatic animals, Water pollution control.

The effect of sediment containing 250, 500, or 1,000 ppm Prudhoe Bay crude oil on the rate of feeding as measured by fecal production by lugworms (Abarenicola pacifica) was tested. Both lugworms and sediment were collected from the high intertidal region of an almost-enclosed lagoon adjacent to Sequim Bay, Washington. At oil concentrations of 500 and 1,000 ppm, the rate of feeding was reduced by 70%. Mean fecal production per unit body weight was moderately depressed in groups exposed to 250 ppm crude oil. Under normal conditions, smaller animals have higher rates of defecation than larger animals. The test results suggest that defecation rates may have potential application as an indicator of levels of environmental stress, and that under conditions of moderate pollution, lugworms may aid in recovery of intertidal zones by maintaining sediment transport through feeding activity. EVALUATION OF PENTRON D-90 TOXICITY TO JUVENILE ESTUARINE FISH AND BLUE CRABS,
Academy of Natural Sciences of Philadelphia, Benedict, MD. Benedict Estuarine Research Lab.
D. T. Buton.
Bulletin of Environmental Contamination and Toxicology, Vol 25, No 3, p 470-476, September, 1980. 4 Tab, 8 Ref.

Descriptors: *Crabs, *Fish, *Estuaries, *Sulfates, Toxicity, Powerplants, Industrial wastes, Iron, Aquatic animals, Bioassay, Water pollution, Effluents, Corrosion control, Aquatic envirnment.

Pentron D-90 is a low molecular weight polyacrylamide-based ferrous sulfate compound which is pending patent for use as a retardant of condenser tube corrosion in stream electric generating facilities. To provide baseline data on the possible toxicity of Pentron D-90 to estuarine organisms, 96-hr static bioassays were conducted on two species of crabs (Leiostomus xanthurus and Callinectes sapidus) and a juvenile Atlantic menhaden (Brevoortia tyrannus) from the Patuxent River, Maryland. A maximum Penton D-90 concentration of 5 mg/liter, similar to actual use levels, in filtered Patuxent River water was tested, since the entire compound and its derivatives will eventually be discharged into the aquatic environment. Result showed that Pentron D-90 was not toxic to juvenile Atlantic menhaden fish or crabs over a 96-hr period at the dose level tested. Calculation of total iron present in the test tanks throughout the 96-hr period indicated that no toxicity from ambient iron combined with iron released from Pentron D-90 would be expected to occur under the buffered conditions of normal estuaries. It was concluded that a Pentron D-90 discharge level of 5 mg/liter proposed for use in electrical plants would pose no harmful effects on estuarine crabs or fish. (Geiger-FRC)

ALGAE AS A CHEMICAL SPECIATION MONITOR-I A COMPARISON OF ALGAL GROWTH AND COMPUTER CALCULATED SPECIATION,
Dalhousie Univ., Halifax (Nova Scotia). Dept. of Chemistry.
R. D. Guy, and A. R. Kean.
Water Research, Vol 14, No 7, p 891-899, July, 1980. 6 Fig, 4 Tab, 43 Ref.

Descriptors: e, Phytotoxicity, Algal toxins, Monitoring, Speciation, Separation techniques, Growth rates, Aquatic environment, Laboratory tests, Computer models.

Heavy metals in the aquatic environment include metals in sediment, metals in suspended particulate or in solution, and metals absorbed onto hydrous oxide and humic colloids. Metals in true solution may be subdivided into free species, inorganic complexes, and complexes with naturally occurring ligands. Chemical speciation of metals is important in analytical and geochemical studies and especially in toxicity studies. Speciation may be studied by electrochemical methods, kinetic differences between complexes, or separation and determination of the metal content of each fraction. An alga, Selenastrum capricornutum, was used as a monitor to examine the relationship between toxicity and metal speciation. Two aspects of the effect of algae on copper speciation were studied in two separate experiments. In the first experiment, glycollic acid was used to complex the added copper, while in the second, the soluble copper/particulate ratio was found by centrifugation of algal suspensions containing different copper/ligand combinations. Increases in copper levels caused decreases in the algal growth rate as measured by chlorophyll fluorescence that were constant during a 24-hr experiment. Solutions containing ethylenediaminetetraacetate, triethylenetetraamine,

nitrilotriacetic acid, and bicine were toxic to algae at a pCu of 8.0. Solutions containing citric acid and ethylene-diamine became algicidal at pCu 9.5 and 8.65, respectively. A comparison of growth and computer-calculated speciation indicated that the copper ethylenediamine complex Cuen(2+) and the copper hydroxide-citric acid complex CuOH-cit(2-) were toxic species to algae. 5D. Waste Treatment Processes

THE COLLECTION, TREATMENT, AND DISPOSAL OF FARM WASTES,
Thames Water Authority, London (England). Conservancy Div.
R. P. Wheeler.
Effluent and Water Treatment Journal, Vol 20, No 8, p 386-390, August, 1980. 2 Fig, 2 Tab, 9 Ref.

Descriptors: *Farm wastes, *Domestic animals, *Organic wastes, *Oxidation, *Waste disposal, Sewage treatment, Slurries, Poultry, Methane, Cattle, Sewage lagoons, Farm lagoons, Odor, Recycling, Aeration, Spraying, Flocculation, Sludge disposal.

Several of the simpler methods of dealing with solid and liquid waste from cattle, pigs, and poultry are discussed. Labor difficulties and the problem of obtaining suitable litter for deep bedding have led to most farms converting to the slurry disposal system, which may be highly mechanized. Reception of waste is usually in a small tank for the initial separation of gross solids, followed by overflow to storage and/or treatment. Treatment is aimed at limiting odor nuisance during storage and disposal to the land and may take one of three forms: the oxidation-ditch system, usually with a paddle-wheel aerator, oxidation in tanks or lagoons with aeration via vanes or propellors, or the barrier-ditch system (for the brown water resulting from the final washing down of cowsheds, yards, and dairies). For pigs, attention is being focused on in-house treatment, usually by means of under-floor oxidation; a chemical flocculation process has reduced BOD from 40-200 to 10 mg/liter and suspended solids from 100-250 mg/liter to 0. The trend in the treatment of poultry waste is toward in-house drying. For the storage of slurry, either prefabricated cylindrical tanks or earth lagoons are used. Largely liquid effluent may be disposed to the land by spreading with tankers or tractor-drawn tanks with a spreading system designed to avoid formation of aerosol sprays and consequent odor. Techniques of subsoil injection are improving. Recycling manure as animal feed, silage, and methane production are also discussed. Complete treatment of farm wastes is rarely justified, as waste should be returned to the land wherever possible. (Gish-FRC)

HOGSMILL VALLEY SEWAGE TREATMENT WORKS,
Effluent and Water Treatment Journal, Vol 20, No 8, p 365, 368, August, 1980.

Descriptors: *Treatment facilities, *Activated sludge, *Sludge treatment, *Settling basins, *Aeration, Biological treatment, Dewatering, Drying, Sludge disposal, Land use, Waste disposal, Waste water treatment, Municipal wastes.

The Hogsmill sewage treatment plant serving the Borough of Kingsten, England is described. The plant operates on the diffused air activated sludge principle for biological oxidation. The facility has been the site of many studies including the air drying of sludge on beds and the effects of mixtures of activated and raw sludge on digesters. Sludge air drying beds were replaced by a system of thickening and transporting digested sludge to agricultural land. The Thames Conservancy had applied an effluent standard to the Hogsmill plant but this was abandoned to initiate improvements at the facility to meet existing standards. In the short time of this study, flow to the plant increased from 382 to 687 liters/sec without increases in plant capacity. High nitrification has occurred in the summer but the quality of final effluents have been generally maintained. Re-aeration channels have been remodeled for use as aeration channels. Changes in sludge withdrawal from final tanks have cut pump running expenses. Retention times for primary sedimentation tanks, aeration channels and final tanks are given. Costs of plant operation have risen dramatically in recent years. Automation is seen as the only solution in the near future to cover emergency and odd-shift labor demands of the Hogsmill facility. (Geiger-FRC)

ZERO DISCHARGE: IT WASN'T A COSTLY PIPEDREAM FOR ONE WATERWORKS,
American City and County, Vol 95, No 8, p 65-66, August, 1980. 3 Fig.

Descriptors: *Treatment facilities, *Coagulation, *Flocculation, *Filtration, *Zero discharge, Water treatment, Recycling, Sludge treatment, Drying, Settling basins, Costs, Installation costs, Operating costs, Seasonal, Water reuse, Municipal water, Dewatering, Chemical degradation, Potable water.

Zero discharge has been achieved at low cost by the Huntsville, Alabama water treatment plant after 18 months of operation. The plant's $4.3 million, 8.0 mgd expansion included a closed-loop filter backwash water recycling system, on-site drying beds for sludge dewatering, and on-site pit sludge disposal. Installation costs were $800,000, operation and maintenance costs were $3,000 for 1979, and sludge handling debt service was $60,000. Sludge disposal and dispersal cost $90/ton in 1979, much lower than for comparable plants. The treatment system at Huntsville includes rapid mixing, alum coagulation, flocculation/sedimentation, dual-media filtration, and chemical addition. The facility has a 2.0 million gallon underground reservoir. Filtration is high rate (60 gpm/sq ft, one filter; 4.0 gpm/sq ft, all filters). The plant is operating excellently with regard to turbidity and pH. The zero discharge system consists of liquid recycle back to the headworks and disposal of solids on site. Disposing of backwash water wastes about 2% of all treated water in a plant; thus this much is saved by recycling. Recycling backwash water also requires less horsepower to pump back through the plant than does raw water. Leopold units that float on the surface of the sedimentation basin remove sludge by siphoning. Their cost was about half that of a conventional sludge removal system. Ways of improving sludge handling in winter are being sought, as sludge production is 325 pounds/million gallons during this season compared with 100 pounds/million gallons in summer. (Gish-FRC)

OLD WATER SYSTEM GETS NEW LIFE,
E. Bilodeau.
American City and County, Vol 95, No 2, p 67-69, February, 1980. 3 Fig.

Descriptors: *Treatment facilities, *Flocculation, *Settling basins, *Filtration, *Lead, Waste water treatment, Costs, Control systems, Recycling, Leaching, Toxicity, Pollutants, Pipes, Chemical degradation, Municipal water, Water reuse, Potable water.

Prior to improvements made in the water system, the water in Bennington, Vermont, contained lead levels five times higher than what is considered safe, and 2,000 of the town's 10,000 residents succumbed to a waterborne disease. A 3 mgd water storage tank, a pumping station, and 20,000 feet of pipeline eliminated low water pressure. A prefabricated treatment plant with two modular filter units was put on line less than 11 months after construction began. This simple filtration system provides mechanical flocculation, tube settling, and mixed media filtration in the space normally occupied by clarifiers alone. Its construction and operating costs are low, and it is very reliable. The control system operates 24 hr/day with 8 hr of supervision, and is manually monitored, which gives the operator a positive control of the plant. The Bennington plant is capable of recycling all backwash water; this both conserves water and makes discharge permits unnecessary. It is also the first water treatment plant to incorporate a chemical process that successfully reduces lead contamination to levels acceptable under federal regulations. Food-grade sodium bicarbonate (550 pounds/day) with liquid sodium hydroxide (90 dry pounds/day) is added to the water. The latter raises the pH from a low of 4.7 to 8.5, while the former provides the alkalinity necessary (25 mg/liter) to form a hard, impervious lead coating on the inside of the lead service pipes which seals the pipe from water and eliminates leaching. Lead concentrations are now approximately 0.02 mg/liter compared with 0.25 mg/liter in May 1977. (Gish-FRC)

CHEMICAL AND MICROBIOLOGICAL IMPACT OF SEWAGE SLUDGE ON SOIL SYSTEMS,
Cook Coll., New Brunswick, NJ. Dept. of Soils Crops.
Lowell A. Douglas.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-121451, Price codes: A04 in paper copy, A01 in microfiche. New Jersey Water Resources Research Institute, Rutgers University, Final completin report, October 1980, 61 p, 25 Fig, 11 Tab, 41 Ref. OWRT-A-038-NJ(3), 14-31-0001-5030.

Descriptors: Water pollution control, *Sewage sludge, Ammonia, Nitrates, *Soil chemistry, *Soil amendments, Computer models, *Organic matter, Model studies, *Soil treatment.

The organic carbon decomposition and nitrogen transformations of two sewage sludges in a sandy loam soil were studied utilizing incubation experiments at temperatures from 8 to 22 deg. C. An 'active organic carbon' fraction decomposed at a higher rate than the bulk of the organic carbon. Q10 values for organic carbon were between 1.6 and 2 and varied with sludge type and sludge/soil ratios. The decomposition of the two sludges in soil was not significantly different at field capacity or at saturated moisture conditions. A regression model in the form of an exponential function between the CO2 evolution and the factors of time, temperature and rate of carbon added was developed, with a good fit to observed values. A simulation model for the transformation of nitrogen based on first and zero order kinetics was developed for the incubation study. A convenient computer program of the IBM 360/system, CSMP, was used to solve the differential equations in the model. The test of the model on the invubation experiment proved that the model was good and powerful in estimating the nitrogen status in such systems. (Douglas, Rutgers)

REMOVAL OF EUTROPHIC NUTRIENTS FROM WASTEWATER AND THEIR BIOCONVERSION TO BACTERIAL SINGLE CELL PROTEIN FOR ANIMAL FEED SUPPLEMENTS: PHASE I,
Catholic Univ. of America, Washington, DC. Dept. of Biology.
B.T. DeCicco.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-124042, Price codes: A02 in paper copy, A01 in microfiche Water Resources Research Center, University of the District of Columbian, Washington, DC. Report 14, November 1977. 2 Fig, 4 Tab, 6 Ref. OWRT-A-006-DC(1).

Descriptors: *Waste water treatment, *Ammonia, *Phosphorus, Bacteris, Nitrates, Single cell protein, *Water reuse, Water pollution sources, Nutrients, Effluents, Sludge, Feeds, Biomass.

The hydrogen oxidizing chemolithotrophic bacterium Alcaligenes eutrophus has been emploed for the removal of eutrophic nitrogenous and phosphorus compounds from the final effluent and digester elutriate from the Blue Plains Wastewater Treatment Plant, Washington, D.C. Average removal levels from final effluent were 98% for ammonia, 67% for nitrate, 93& of TKN and 84% for total phosphorus. Mixtures of 1 part elutriate to

3 parts effluent yielded 88% removal of both ammonia and total phosphorus. No pretreatment of elutriate or effluent was necessary to support groth, and sterilization of wastewater samples yielded results similar to unsterile samples; i.e., the chemolithotroph need not be grown in pure culture. A hydrogen oxidizing chemolithotroph different from A. eutrophus has been isolated from Blue Plains final effluent and has been classified as a member of the genus Pseudomonas.

REMOVAL OF EUTROPHIC NUTRIENTS FROM WASTEWATER AND THEIR BIOCONVERSION TO BACTERIAL SINGLE CELL PROTEIN FOR ANIMAL FEED SUPPLEMENTS: PHASE II,
Catholic Univ. of America, Washington, DC. Dept. of Biology.
B. T. DeCicco.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-124059, Price codes: A02 in paper copy, A01 in microfiche. Water Resources Research Center, University of the District of Columbia, Washington, D.C. Report 15, April 1979. 14 p, 4 Tab, 9 Ref. OWRT-A-006-DC(2).

Descriptors: *Wastewater treatment, *Ammonia, *Phosphorus, *Bacteria, Single cell protein, *Water reuse, Water pollution sources, Effluents, Nutrients, Microorganisms, Sludge, Feeds, Biomass.

The bacterium Alcaligenes eutrophus was grown in phosphorus supplemented digestor elutriate from the Blue Plains Wastewater Treatment Plant using a microbial fermentor. Gaseous hydrogen, oxygen and carbon dioxide were supplied as carbon and energy sources. Ammonia and phosphate removal averaged 87% and 93%, respectively, at the time of cell harvest. The cellular biomass was washed, dried, chemically analyzed and employed as the protein component of check diets. The biochemical composition of the wastewater grown biomass was 8.7% RNA, 1.3% DNA, 56% protein, 3.2% carbohydrate, and 30.8% lipid and inert materials. Chick feeding experiments demonstrated that the bacterial biomass had a protein quality of 88% compared to reference casein. In sterilized samples of sludge: effluent at dilutions of 1:4, 1:8 and 1:20 under a H2, O2CO2 atmosphere, growth of A. eutrophus was substantial and was proportional to the sludge concentration, reaching 8 x 10 to the ninth power organisms/ml in the 1:4 mixture. When the gas atmosphere was replaced by air, growth was substantially less. Chemical analyses of the treated mixtures showed 89-92% ammonia removal and 98-99% phosphate removal from gassed cultures. Cultures incubated under air showed increases in ammonia levels of 25-67% and phosphate reductions of approximately 90%. The bacterial system employed in these studies appears to be an efficient means of removing nitrogenous and phosphorus pollutants from final effluent, digester elutriate and undigested sludge resulting from wastewater treatment. The bacterial biomass produced during elutriate treatment appears to possess high nutritive value as a protein source for chick feed.

REMOVAL OF EUTROPHIC NUTRIENTS FROM WASTEWATER AND THEIR BIOCONVERSION TO BACTERIAL SINGLE CELL PROTEIN FOR ANIMAL FEED SUPPLEMENTS: PHASE III,
Catholic Univ. of America, Washington, DC. Dept. of Biology.
B. T. DeCicco.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-124067, Price codes: A02 in paper copy, A01 in microfiche. Water Resources Research Center, University of the District of Columbia, Washington, D.C. Report 16, April 1980. 13 p, 2 Fig, 3 Tab, 9 Ref. OWRT-A-006-DC(3).

Descriptors: *Wastewater treatment, *Ammonia, *Phosphorus, *Bacteria, Single cell protein, Water reuse, Water pollution sources, Nutrients, Effluents, Sludge, Feeds, Biomass.

We previously have demonstrated that the bacterium Alcaligenes eutrophus is an efficient and effective remover of nitrogenous and phosphorus compounds from municipal wastewaters. Further, the biomass generated from growth on wastewater proved to be a source of high quality protein for the growth of chickens. During this phase a quantity of biomass grown in the fermentor on digester elutriate was treated with a variety of conditions in order to find conditions which promoted cellular aggregation, since this would allow easier separation of cellular biomass from the treated wastewaters. Two treatments produced sedimentation of the cells: either addition of alkali to pH 11 or the addition of an anionic exchange resin (Cellex-D) produced aggregation of the biomass and clarification of the wastewaters. Elutriate samples that were unheated and then inoculated with A. eutrophus yielded little growth, while samples heated to 50 and 70 deg. C produced cell densities that were 74% and 94% respectively, as high as a sample sterilized by autoclaving. Thus a heat labile inhibitor of A. eutrophus was present in elutriate. Samples of digester elutriate, secondary digested sludge and primary undigested sludge were analyzed for the presence of mutagenic substances using the Ames Salmonella mutagenicity test. Samples were assayed both with and without metabolic activation with rat liver S-9 mix. Tests were negative with all samples and bacterial strains with the possible exception of a marginally positive response with both sludge and elutriate samples tested with strain TA 1537.

GAS TREATMENT OF LIQUID,
Stamicarbon, BV., Geleen (Netherlands). (Assignee).
F. J. Fontein, and H. F. Jennekens.
U.S. Patent No. 4,189,384, 6 p, 3 Fig, 7 Ref; Official Gazette of the United States Patent Office, Vol 991, No 3, p 990, February 19, 1980.

Descriptors: *Patents, *Waste water treatment, *Water pollution treatment, *Aeration, Biological treatment, Jets, Equipment.

The purpose of the invention is to achieve improved aeration of waste water in biological purification installations, to keep the water in the basin in motion, and not to damage substances that are present in the liquid. Gas is supplied under pressure to a generally bell-shaped chamber placed below the surface of a body of wastewater to form a gas space in the chamber. A stream of liquid is introduced into the gas space in the form of at least one liquid jet which passes through the gas space and into the liquid to drive gas into the liquid. The chamber is effectively placed one to several meters below the water surface. The water jets may be formed with the aid of a horizontal feed tube provided with one or more outlet apertures which face downwards at a slant. (Sinha-OEIS)
W81-00372

WASTE WATER TREATMENT,
Amax, Inc., Greenwich, CT. (Assignee).
J. M. Laferty, G. G. Van Riper, and W. P. Zundel.
U.S. Patent No 4,189,381, 6 p, 1 Fig, 4 Tab, 5 Ref; Official Gazette of the United States Patent Office, Vol 991, No 3, p 989, February 19, 1980.

Descriptors: *Patents, *Waste water treatment, *Water pollution treatment, Industrial waters, Molybdenum, Heavy metals, Separation techniques, Ion exchange, Chemical precipitation, Flocculation, Electrolysis, Foam separation, Cyanides.

The invention relates to the treatment of industrial waste water for recycling to surface waters and to the treatment of waste water obtained in mineral recovery processes, such as in the flotation recovery of molybdenite. Waste water containing over 2 ppm Mo and at least one heavy metal impurity selected from the group consisting of Fe, Mn, Cu, Zn, Pb, and Cd, and also containing cyanide ion (CN) is treated by passing waste water having an adjusted pH value ranging from about 3 to 4 through an ion-exchange resin column selective to the removal of Mo and provide an ion-exchange effluent containing at least one of the heavy metal impurities and the cyanide ion. The pH value of the effluent is then adjusted to a range of about 7 to 11 sufficient to precipitate the heavy metal impurity having the highest pH requirement for precipitation. The precipitate is flocculated and the effluent containing the flocculated precipitate is subjected to electrolysis using insoluble electrodes to form electroflotation of the flocculated precipitate to form a froth which is separated from the effluent by skimming. (Sinha-OEIS)

BIOLOGICAL TREATMENT AND TOXICITY STUDIES,
Beak (T. W.) Consultants Ltd., Vancouver (British Columbia).
Environmental Protection Service, Ottawa, Ontario, Canada, Water Pollution Control Directorate. Economic and Technical Review Report EPS 3-WP-73-6, 1973. 64 p, 51 Fig, 14 Tab, 27 Ref, 7 Append.

Descriptors: *Alberta, *British Columbia, *Aerated lagoons, *Biological treatment, Kraft mills, Mathematical modelling, Effluents, Testing, Evaluations, Heat loss, Data collection, *Waste water treatment, Lagoons, Canada.

The results of a comprehensive survey of three aerated lagoons treating kraft mill effluents in Western Canada are presented. Each lagoon is provided with surface mechanical aeration and has a residence time of five days. Long term operating data for each system is reported including summer and winter BOD removal efficiencis, aerator loadings, and oxygen transfer efficiencies. Consieration was given to start-up procedures, temperature losses through the lagoon, optimum nutrient additions, pH effects, quiescent zones, and sludge accumulations. A detailed investigation of the overall mixing conditions in an aerated lagoon was made using Fluorescent tracer techniques. Lagoon geometry was more important than aeration horsepower in determining the mixing characteristics. Mathematical mixing models were developed for each system and are useful both for aerated lagoon performance prediction and for aerated lagoon design. (WATDOC)

ON-SITE TREATMENT FOR LOW-DENSITY AREAS,
American City and County, Vol 95, No 4, p 45-48, April, 1980. 2 Fig, 1 Tab.

Descriptors: *Domestic wastes, *Waste treatment, *Sewerage, Septic tanks, Sewage disposal, Waste disposal, Costs, Sand mounds, Leaching, Absorption, Anaerobic digestion, Sewage lagoons, Filters, Evapotranspiration.

Various means for achieving on-site treatment of household wastes are explained. EPA figures indicated that, in 1978, 32% of the population in the U.S. was not served by primary, secondary, or advanced waste treatment facilities. The septic tank/leaching field is suitable where soils have a percolation rate no faster than 0.1 min/inch and no slower than 60 min/inch. High seasonal water table areas must be avoided. Elevated sand mounds may be used in soils that cannot support an absorption field. Mounds must be shaped and located to function according to effluent flows and topography. They must not be located on slopes of > 12%. For a standard three-bedroom home with an estimated flow of 450 gpd, a mound with a base area of 7,200 sq ft is needed. Aerobic and anaerobic lagoons may also be used to catch septic tank effluent. In some places, such lagoons have met the 30/30 BOD suspended solid standard most of the year. Evapotranspiration beds have worked well in cold weather regions. However, in other areas, continual surface overflowing has caused problems. Sand filters can cost $3,000-$4,000 and are of two types, intermittent and recirculating. Non-soil-dependent on-site systems usually consist of small, aerobic package units and one of the treatment/disposal options associated with septic tanks. (Baker-FRC)

EBMUD: AWARD WINNING SEWAGE WORKS,
American City and County, Vol 95, No 6, p 47-49, June, 1980. 6 Fig.

Descriptors: *Activated sludge, *Chlorination, *Sewage treatment, *Water reuse, *Oxygen activated sludge, Anaerobic digestion, Pumps, Pacific Coast Region, Recycling, Treatment facilities, Industrial water, Industrial wastes, Domestic water, Oxygen, Disinfection, Water purification, Reclamation, Waste water treatment, Nitrification.

The first large-scale pure oxygen activated sludge secondary treatment system in California is discussed. This facility, located in the East Bay Municipal Utility District in Oakland, meets federal and state requirements for discharges to San Francisco Bay and also reclaims up to 1.0 mgd of treated effluent for in-plant use. Both domestic and industrial waste water are treated for an area of 83 sq miles and for 600,000 people. Primary treatment, effluent disinfection, and water reclamation for in-plant use are discussed. A UNOX high-purity oxygen activated sludge system provides secondary treatment for the plant's 71 mgd of waste water. This process has a peak hydraulic capacity of 168 mgd. A three-stage open-top nitrification tank with fine bubble diffusion of high-purity oxygen is used to polish secondary effluent to produce the industrial grade water. (McKeon-FRC)

LEACHATE CONTROL DOESN'T COME EASY,
American City and County, Vol 95, No 5, p 69-72, May, 1980. 3 Fig, 1 Tab.

Descriptors: *Leachate, *Landfills, *Water pollution control, *Waste disposal, Waste water, Sewage treatment, Drainage systems, Waste treatment, Runoff, Groundwater, Percolation, Recycling, Legislation, Sewerage, Waste water treatment.

Sanitary landfills almost always produce leachate, and BOD, COD, suspended solids, and turbidity are much greater in leachate than in raw municipal waste water. In addition, the former often also has low pH, low dissolved oxygen, toxic chemicals, and heavy metal ions. Leachate treatment systems range from those based entirely on soil attenuation to a complex chain of physical-chemical and biological steps. Collection systems generally depend either on a relatively impermeable natural clay liner or on an artificial membrane at the bottom of the fill. Runoff should be diverted into drainage channels, and slopes of 3-5% are recommended. The Henrico County, Virginia landfill has no artificial liners, collection mechanisms, or treatment systems; ground- and surface water is diverted round the site, all leachate will move to a treatment zone before discharge, there will be four or six leachate flow-through impoundments, and the site accepts no industrial or hazardous wastes or sewage sludge. In Montgomery County, Pennsylvania, leachate recycling has been practiced for the last 5 yr with moderately good results. In Wisconsin, some fills discharge leachate directly into sewage systems with no ill effects, and fills have been placed below the zone of saturation without groundwater contamination (clayey soils are particularly suitable); also, a law requiring treatment of leachate 20-30 yr after site closure is in effect. Percolation must be reduced, and a means of forecasting the amount and type of leachate that will be produced in the long term must be devised. (Gish-FRC)

REMOVAL OF NITROGEN FROM INDUSTRIAL WASTE WATERS BY BIOLOGICAL NITRIFICATION-DENITRIFICATION,
Degremont S.A., Rueil-Malmaison (France).
M. A. Picard, and G. M. Faup.
Water Pollution Control, Vol 79, No 2, p 213-224, 1980. 5 Fig, 4 Tab, 10 Ref.

Descriptors: *Nitrification, *Denitrification, *Biological treatment, *Industrial wastes, Sludge treatment, Nitrogen-fixing bacteria, Waste water treatment, Water pollution sources, Fertilizers, Explosives, Chemical wastes, Nutrients, Carbon, Equipment.

The level of nitrogen in industrial waste waters depends upon the type of industry which produces the pollution. Considerable variations in the nitrogen levels of effluents from different industries are found, with highest concentrations being produced during the manufacture of nitrogen-based fertilizers, gunpowder and explosives, and chemicals. More than 90% of the nitrogen contamination may be removed from industrial effluents by nitrification-denitrification techniques. Precautions must be taken to ensure that the influent contains no products that are harmful to the nitrification process. At the Hoechst Cuise Lamotte plant in France, nitrification was halted for three weeks when a product toxic to nitrifying bacteria was discharged. An external source of carbon may be needed to allow denitrification to proceed depending upon the effluent composition. Single-, two-, or even three-sludge systems may be used depending on whether treatment of carbonaceous pollution, nitrification, and denitrification are to be kept as separate processes or combined. In a single-sludge system, the anoxic tank will remain at the inlet, while in the two-sludge system based on nitrification in the first tank, denitrification will be carried out in a separate tank, yielding savings in the size of tanks required. However in the two-sludge system, the problems connected with precise dosing of organic carbon pose a severe limitation. Good results are obtained with the single-sludge process without the need of a sophisticated method of organic carbon addition. (Geiger-FRC)
W81-00425

THE EFFECTS OF NITRATE CONCENTRATION AND RETENTION PERIOD ON BIOLOGICAL DENITRIFICATION IN THE ROTATING-DISC SYSTEM,
Stuttgart Univ., (Germany, F.R.).
P.-S. Cheung, and K. Krauth.
Water Pollution Control, Vol 79, No 1, p 99-105, 1980. 6 Fig, 2 Tab, 8 Ref.

Descriptors: *Nitrification, *Denitrification, *Waste water treatment, Biological treatment, Sewage treatment, Sludge treatment, Sewage bacteria, Nitrates, Rotating disc system, Anaerobic conditions, Alcohols, Effluents.

Rotating disc systems (RDS) have been used successfully to remove oxidized nitrogen compounds from waste water by biological denitrification. This requires a carbon source, appropriate bacterial populations, and anaerobic conditions. The influence of retention period and nitrate levels on the denitrification process in an RDS were studied at 20-22 C and pH 7-8. The RDS used was 1.0 m in diameter and had an area of 14.97 sq m. The rotation speed was 3.23 rpm for each phase of a two-part experiment. During the first phase, the retention periods and nitrate loadings were varied, while in the second phase, retention periods were varied and nitrate loadings were kept constant. Nitrate nitrogen, nitrite nitrogen, ammoniacal nitrogen and residual methyl alcohol were determined in filtered samples daily. BOD and sludge production were analyzed at the end of each experiment. Results showed that the denitrification rate and sludge production are linear functions of nitrate loading. Within a nitrate loading range up to 18.85 g/sq m/day, a first order reaction took place for denitrification in the RDS with respect to nitrate levels in the influent. An optimum hydraulic retention period of 1.5 hr was recommended. The solids retention period was also found to be a linear function of nitrate loading as well as of the hydraulic retention period. Suspended solids in the effluent (wasted sludge) could not be regulated in the RDS; therefore a system with a larger disc is recommended to provide a higher solids retention period to yield greater stability and flexibility during the denitrification process. (Geiger-FRC)
W81-00428

EFFECT OF SYSTEMS SOLIDS RETENTION TIME (SSRT OR SLUDGE AGE) ON NITROGEN REMOVAL FROM ACTIVATED-SLUDGE SYSTEMS,
Toronto Univ. (Ontario).
P. H. Jones, and H. M. Sabra.
Water Pollution Control, Vol 79, No 1, p 106-116, 1980. 13 Fig, 8 Tab 28 Ref.

Descriptors: *Waste water treatment, *Denitrification, *Nitrification, *Sludge treatment, Biological treatment, Nitrates, Heavy metals, Toxins, Sludge age, Suspended solids, Dissolved oxygen, Nitrogen, Domestic wastes, Oxidation, Alkalinity.

Many biological processes have been developed for the reduction of nitrogen in waste water treatment. One theory proposed that the solids retention time (SRT) governed the kinetics of the biological treatment processes. The quality of the effluent, volatile suspended solids, and oxygen demands were shown to be a function of sludge age. Nitrification requires dissolved oxygen (DO) to complete the oxidation of nitrogen, while denitrification calls for a suitable environment for the reduction of nitrate to nitrogen gas. Other factors affecting nitrification are pH, alkalinity, DO levels and the presence of heavy metals or toxic substances. The effect of systems SRT (SSRT or sludge age) on total nitrogen removal was evaluated at 7, 15, and 25C. Results showed that at a constant temperature, increasing the SSRT increases the total nitrogen removed from the system. Almost complete nitrogen removal occurred with SSRT values of 3 days at 25C, 6 days at 15C, and 20 days at 7C. The rate of ammoniacal nitrogen oxidation increased with increasing sludge age. Results of the present study agreed well with the Marais equation for predicting minimum sludge age required to achieve complete nitrification at different temperatures. The assumption of zero-order reaction for both nitrification and denitrification rates proved valid for the levels of nitrogen commonly present in domestic waste water. (Geiger-FRC)

MICROSCSREENS POLISH LAGOON EFFLUENT,
M. E. Harrelson.
American City and County, Vol 95, No 5, p 75-77, May, 1980. 2 Fig.

Descriptors: *Sewage lagoons, *Chlorination, *Screens, *Waste water treatment, Biological oxygen demand, Suspended solids, Algal control, South Carolina, Ponds, Control systems, Oxidation lagoons, Effluents, Sewage treatment, Costs, Construction costs, Municipal wastes.

zn overloaded lagoon in Camden, South Carolina was upgraded by the installation of ultrafine screens. Tests showed that microscreens with one micrometer polyester media could effectively screen out algal solids from oxidation pond effluents without the use of chemicals and at the same time maintain secondary treatment standards in the effluent. During a 24-hr pilot test, the microscreen reduced the average influent suspended solids from 128 ppm to 19 ppm and average BOD from 37 ppm to 16 ppm. Average flow rate through the screen was 2.0 gpm/sq ft of new effective submerged area. The new facility includes a mechanically cleaned bar screen followed by two 15-acre oxidation ponds. The first pond has three plug-flow aeration cells created with floating aerators and curtain partitions. Pond effluent is lifted to the microscreens by variable speed screw pumps. Six 10 ft x 16 ft microscreens remove the algae. Screen effluent is then chlorinated and discharged. Piping and valving will allow parallel, series, or single cell operation of the lagoons. This facility will be the first completely automatic microscreen operation using on-line suspended solids monitoring and process control. The construction

contract costs for this facility was $2.3 million, or $1.22/gal of plant capacity compared with $2.14/gal of plant capacity for a conventional activated sludge facility. (McKeon-FRC)

Water Research, Vol 14, No 7, p 909-915, July, 1980. 5 Fig, 5 Tab, 11 Ref.

Descriptors: *Disinfection, *Chlorination, *Pathogenic bacteria, *Waste water treatment, Aquatic bacteria, E. coli, Salmonella, Streptococcus, Streams, Lake Ontario, Mutagens, Carcinogens, Tracers, Mortality, Public health, Water pollution sources, Sewage effluents.

The effects of chlorination and other disinfection processes on aquatic life exposed to low residual levels have become important with regard to possible mutagenicity and carcinogenicity of these compounds. Two experiments using bacteria as indicator organisms to monitor levels of residual disinfectants from waste water treatment processes are reported. An investigation was made of the rate of transport and survival period of Serratia marcescens in a small Canadian stream, while a second study examined the die-off rate of E. coli, Streptococcus faecalis, and Salmonella thompson in membrane filter chambers in Lake Ontario and Hamilton Bay. Results showed recovery of S. marcescens up to 22 days. This bacterium was also traced for a distance of 20 km. Survival studies of indicator organisms and pathogens in Hamilton Bay and Lake Ontario resulted in a minimum survival for all three organisms of 28 days. E. coli displayed a much slower die-off rate than S. faecalis, suggesting that infrequent point discharges of fecal matter had a possible cumulative effect which would promote the growth of pathogens and pose a threat to health. Complete removal of viable microorganisms by sewage treatment processes may be necessary before any consideration is given to the elimination of disinfection procedures. (Geiger-FRC)

DETERMINATION OF BIOLOGICAL REMOVAL OF ORGANIC CONSTITUENTS IN QUENCH WATERS FROM HIGH-BTU COAL-GASIFICATION PILOT PLANTS,
Argonne National Lab., IL. Energy and Environmental System Div.
V. C. Stamoudis, and R. G. Luthy.
Water Research, Vol 14, No 8, p 1143-1156, August, 1980. 5 Fig, 6 Tab, 10 Ref.

Descriptors: *Organic wastes, *Coal mine wastes, *Activated sludge, Industrial wastes, Gas chromatography, Waste treatment, Mass spectrometry, Biological treatment, Aromatic compounds, Pilot plants, Organic compounds, Quenching, Phenols.

The efficiency of a bench scale, activated-sludge treatment to remove organic constituents from coal-gasification process effluents was examined. Raw gas quench waters were obtained from two gas technology pilot plants to evaluate the efficiency of biological oxidation for organic removal. Bituminous Illinois No. 6 coal was used for the HYGAS steam-oxygen process and Indian Head lignite was used for the slagging, fixed-bed (SFB) process. The biological reactors employed were complete-mix, single-stage, air-activated sludge reactors with internal clarifiers. Influent and effluent reactor samples were extracted with a methylene chloride pH-fractionation technique into acid, base, and neutral fractions. Each fraction was subjected to capillary-column gas chromatography/mass spectrometry. Almost 99% of extractable and chromatographic organic material of both HYGAS and SFB influent acid fractions consisted of phenols and alkylated phenols. These compounds were removed almost completely by activated sludge treatment. Satisfactory removal was achieved for base-reaction organics with the exception of certain alkylated pyridines. Removal of neutral-fraction organics was also good, except for certain alkylated benzenes, certain polycyclic aromatic hydrocarbons, and some cycloalkanes and cycloalkenes, especially when influent levels were low. (Geiger-FRC)

SLUDGE TREATMENT VS. ENERGY CONSERVATION,
K. Grover.
American City and County, Vol 95, No 2, p 39-40, 42, February, 1980. 2 Fig.

Descriptors: *Sludge treatment, *Energy, *Heat treatment, Chemical degradation, Costs, Sewage sludge, Sewage treatment, Dewatering, Ultimate disposal, Waste water treatment, Sludge digestion, Solid wastes, Water pollution control, Treatment facilities.

Problems are experienced by communities with an abundance of 'untreatable' sludge. Sludge comprises about 50% of the total treatment cost and 90% of the problems associated with waste water treatment. Each year about 4.2 million tons of sludge are produced. This will increase to 6.7 million tons by 1985. Digestion, which was the most common treatment method, does not meet new federal standards. For sludge that would dewater easily, heat treatment was used until its cost escalated after 1972. In 1972, costs for heat and chemical treatment were about the same. In 1979, the heat treatment of sludge cost $42/ton more than chemical treatment. Odor control and the disposition of the cooking liquor are also problematic. However, wet air oxidation, a heat treatment system, is working impressively, and new ideas about the placement of the heat treatment equipment in the overall design of the system may improve efficiency. The heat treatment reactor temperature ranges from 300 to 500 F, killing viruses and rendering the sludge sterile. Heat treatment can produce a dewatered sludge cake of 30-40% solids by weight. Chemical conditioning produces a cake of 15-20% solids at a smaller loading rate on dewatering equipment. However, heat treatment can deliver smaller solids loads downstream. (Baker-FRC)

SEWAGE-SLUDGE INCINERATION RAISES AIR POLLUTION CONCERNS,
Environmental Protection Agency, New York.
R. T. Dewling.
Water and Sewage Works, Vol 127, No 10, p 26-29, 43, October, 1980. 4 Fig, 5 Tab, 10 Ref.

Descriptors: *Incineration, *Sludge disposal, *Air pollution, Sewage sludge, Sewage treatment, Water pollution, Heavy metals, Organic compounds, Polychlorinated biphenyls, Temperature, Particle size, Toxins, Lead, Cadmium, Ultimate disposal, Trace elements.

Compliance of sewage sludge incinerators with federal standards for emissions and opacity depends on the characteristics of the feed sludge and operating temperatures. Multiple-hearth and fluidized bed incinerators are used in the U.S. The environmental impacts of incineration include water pollution due to boiler blowdown and scrubber water discharges as well as ash handling and disposal. Most of the heavy metals found in sludge are concentrated in the ash at levels of $> 1\%$. Poor incineration can lead to the formation of odorous, partially oxidized hydrocarbons (e.g., aldehydes, ketones) and sometimes sulfur oxides. Uncontrolled particulate emissions may vary from 4-110 kg/mg dry sludge input, depending on incinerator type and sludge composition (e.g., percentage volatile solids, moisture). Organic pollutants, including polychlorinated biphenyls, low-molecular weight hydrocarbons, and heavy metals, may be emitted if operating conditions are inadequate. EPA tests of a fluidized-bed incinerator in the New York metropolitan area indicated that, when incinerator temperatures increased from 1,200 to 1,750 F, lead emission increased 25-fold (3.1-77.0 mg/g) and cadmium increased almost 10-fold (1.0-8.1 mg/g). These increased emissions are associated with respirable particles of < 3 micrometers. The lowest possible trace metal emission would be provided by a two-stage system where the main incinerator is operated at the lowest possible temperature while an afterburner operates at a very high temperature ($=$ or $>$ 1,800 F). This would be followed by air-pollution control, so most of the toxic organics would be destroyed. (Gish-FRC)
W81-00442

INCINERATION IS A WASTE-MANAGEMENT ALTERNATIVE,
W. R. Niessen.
Water and Sewage Works, Vol 127, No 10, p 30-31, 49, October, 1980. 2 Fig, 2 Ref.

Descriptors: *Incineration, *Heat balance, *Waste disposal, *Temperature, *Solid wastes, Toxicity, Water pollution, Air pollution, Energy, Conservation, Costs, Heavy metals, Inorganic compounds, Gases, Sewage sludge, Dusts, Waste water(Pollution), Ultimate disposal.

Incineration as an alternative to hazardous waste management is being encouraged, even though there are operating and environmental problems associated with this method. The advantages of incineration include volume reduction, regulatory compliance, detoxification, and energy recovery, while the disadvantages are cost, operational and staffing problems, air and water pollution, public-sector reaction, and technical risk. Analysis of energy effects for most combustion systems emphasizes the benefits of concentrating combustibles. Waste combustion can produce air pollutants, but in amounts that can be anticipated. The appearance of combustible particulate in incinerator effluent reflects inadequate combustion effectiveness. Mineral particulates from incinerator stacks can become contaminated by enriched concentrations of heavy metals. The degree of concentration in the particulate relative to the bulk waste depends on the physical form of the waste and on the nature of the heavy metals. Gaseous pollutants include sulfur oxides, hydrogen chloride, and nitrogen oxides. The most important parameter for a combustor is volumetric heat release rate, and the second is peak combustion temperature. Three major residue streams are produced by an incinerator: that from the primary chamber, dusts in flues, and scrubber sludge. A waste water stream may also be produced. (Gish-FRC)

MICROBIOLOGY OF A PESTICIDE DISPOSAL PIT,
Iowa State Univ., Ames. Dept. of Bacteriology.
L. M. Johnson, and P. A. Hartman.
Bulletin of Environmental Contamination and Toxicology, Vol 25, No 3, p 448-455, September, 1980. 1 Fig, 2 Tab, 16 Ref.

Descriptors: *Pesticides, *Microbiology, *Bacteria, *Waste disposal, Pseudomonas, Cultures, gas chromatography, Liquid wastes, Soil microbiology, Rocks, Chlorinated hydrocarbon pesticides, Carbamate pesticides, Organophosphorus pesti-

cides, Triazine pesticides, Ultimate disposal, Underground waste disposal.

The microbiological activity of the pesticide disposal pit at Iowa State University was monitored after 8 yr of use. Pesticides disposed of in the pit included chlorinated hydrocarbons, triazines, organophosphates, and carbamates. The pit was 0.9 m deep at one end and 1.2 m deep at the other with dimensions of 9.1 m by 3.7 m. Sample pipes were placed 2 m apart along the central axis of the pit, and aqueous samples drawn from them were processed aerobically and anaerobically to evaluate microbial life. Pit soil samples were collected near each sample pipe. Submerged rocks were randomly collected from the pit and scrubbed in sterile deionized water. Rock washings were diluted and plated on peptone agar to determine viable cell numbers. Eighty-nine percent of the 119 randomly selected isolates from pit liquid were gram-negative rods. Of these, 65% were pseudomonads. Twenty-nine percent of the pit liquid isolates were unidentifiable motile, gram negative rods, while gram positive bacteris were mostly Arthrobacter (7%), Micrococcus (3%), and Streptomyces (2%). Six of 20 isolates selected on the basis of colonial morphology grew well in sterile pesticide pit liquid. Viable cells per gram of soil ranged from 400,000-630,000 on trypticase soy agar. Bacteria found in soil included the Bacillus species (50%), Pseudomonas (21%), gram-negatie rods (21%), Citrobacter (4%), and Arthrobacter (1%). Bacterial species found on rock surfaces resembled those recovered from pit soil. No pesticide-free control pit was available for comparison. Day to day fluctuations were noted in pit temperature and pH The presence of a particular bacteria in the pit did not prove that pesticies were degraded by that organism. Gas chromatographic studies on pit liquid showed no long-term accumulation of any pesticide. (Geiger-FRC)

5F. Water Treatment and Quality Alteration

THE MECHANISM OF OZONE INACTIVATION OF WATERBORNE VIRUSES,
Ohio State Univ., Columbus. Dept. of Civil Engineering.
O. J. Sproul, and C. K. Kim.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-127334, Price codes: A03 in paper copy, A01 in microfiche. Completion Report, July, 1980. 32 p, 8 Fig, 3 Tab, 38 Ref. OWRT-B-013-ME(2).

Descriptors: *Ozone, *Waste water treatment, *Water treatment, *Chlorination, *Disinfection, *Viruses, *Bacteriophage, Oxidation, Water quality, Water quality control, Odor, Treatment, Water purification, Chemical reactions, Aquatic microbiology, Diseases, Biocontrol, Infection, Microorganisms, Water pollution, Water pollution sources.

Ozone has received recent attention as an alternative disinfectant to chlorine in water and waste water treatment practices due to its more rapid powerful germicidal activity and no reported side-effects as can result from chlorination, such as taste, odor, and toxic byproducts. The present study sought to determine the ozone inactivation mechanism for viruses in water using the f2 RNA containing virus and T4 DNA containing virus bacteriophages as models. It was concluded that ozone inactivated the f2 and T4 bacteriophages by attacking capsid protein, with liberation and inactivation of the nucleic acid. RNA from f2 bacteriophage at least partially inactivated prior to release from the capsid, with the inactivation rate slower than the whole phage but faster than the naked RNA exposed to ozone. Finally, DNA released from T4 bacteriophage was rapidly inactivated by ozone at about the same rate as the intact phage. The study results suggested that the RNA of enteric viruses may retain their infectivity after liberation from the viral particle during ozonation of water and waste water, if they are inactivated by ozone in the same manner as the f2 phage. APPARATUS FOR CONTROLLED CHLORINATION OF WATER WITH AN ALKALI METAL DICHLOROISOCYANURATE,
FMC Corp., Philadelphia, PA. (Assignee)
C. D. Watson.
U.S. Patent No 4,181,702, 13 p, 3 Fig, 26 Ref; Official Gazette of the United States Patent Office, Vol 990, No 1, p 275, January 1980.

Descriptors: *Patents, *Water treatment, *Water purification, *Chlorination, Quality control, Disinfection, Instrumentation, Equipment.

An apparatus and method are disclosed for the controlled chlorination of a water supply in which an alkali metal salt of dichloroisocyanuric acid is dissolved to form a concentrated chlorine solution that is slowly released into the water supply. The apparatus contains an internal standpipe, open to the water supply at its bottom end and having water inlet apertures and solution metering apertures in its wall. The natural circulation of water in the sandpipe through the solid dichloroiscyanurate charge contained in the apparatus in chlorination of the water supply at a rate controlled by the size number of solution metering apertures. THE IMPACT OF DESALTING ON WATER SUPPLY - ALAMOGORDO, NEW MEXICO,
Herkenhoff (Gordon) and Associates, Albuquerque, NM.
D. D. Jardin.
In: A Quarter Century of Water Research. Proceedings of the Twenty-Fifth Annual New Mexico Water Conference. Apr. 24-25, 1980. WRRI Report No 124, Aug. 1980. p 192-195. New Mexico Resources Research Institute, New Mexico State University, Box 3167 Las Cruces, NM 88003.

Descriptors: *New Mexico, *Desalination, *Water supply, *Water quality, *Construction costs, *Saline water, Planning, Legislation, Engineering, Descaling, Dissolved solids, Research and development.

Alamogordo was one of two cities selected by OWRT to have a demonstration program of desalting technology. Their water quality is good; however, the supply meeting federal standards does not meet demand, especially in midsummer The only additional supply is groundwater. The OWRT has agreed to pay 85% of the construction costs ($13 million) for a plant capable of treating two million gallons a day. Final water approval to proceed is pending. Higher quality water improves the taste of food, reduces soap use and extends the lives of appliances. The average homeowner would save approximately $9.56 a month, or $114 a year, as a result of reduced appliance maintenance, soap use, and municipal costs. Alamogordo has the opportunity to lead the state in desalting technology, to produce high quality water and to help other communities learn how to improve their water supply. (Atkins-Omniplan)

DISPUTES OVER WATER QUALITY POLICY: PROFESSIONAL CULTURES IN CONFLICT, 1900-1917,
Carnegie-Mellon Univ., Pittsburgh, PA.
J. A. Tarr, T. Yosie, and J. McCurley, III.
American Journal of Public Health, Vol 70, No 4, p 427-435, April, 1980. 1 Fig, 51 Ref.

Descriptors: *Sewerage, *Public health, *Sanitary engineering, *History, Political aspects, Combined sewers, Riparian rights, Municipal water, Filtration, Economic feasibility, Water quality standards, Legislation.

A review of historical information concerning disputes between professional groups over water quality policy between 1900 and 1917 indicates that the issues have remained the same through history. The origin of the dispute concerned the health-efficacy of combined or separate sewers. The central issue was which profession was most qualified to determine public health standards and policy within the framework of municipal cost constraints. Construction of sewage systems causing deterioration of downstream water supplies resulted in a wave of legislation and numerous court cases identifying responsibilities of riparian users. Water quality enforcement was primarily entrusted to health professionals, yet included sanitary engineers. The year 1900 marked the beginning of debate between engineers and physicians over water filtration versus sewage treatment plus water filtration as means of protecting water quality and reducing typhoid fever hazard. Economic feasibility and professional expertise were the focus of the debate. A case study of the history of sewage treatment in Pittsburgh is presented and three issues in this case which still persist are summarized. These are the focus on cure rather than prevention, the difference in perceptions of economic necessity and municipal financial limitations, and the different opinions on the social benefit of water quality standards. UNDERGROUND RESERVOIRS CAN CONTROL STORMWATER OVERFLOWS,
Randolph and Associates, Inc., Peoria, IL.
G. Sherwood, G. Hewitt, and R. Helm.
American City and County, Vol 95, No 3, p 41-43, March, 1980. 3 Fig, 1 Tab.

Descriptors: *Storm runoff, *Waste water treatment, *Storm drains, *Biological oxygen demand, *Water storage, Costs, Illinois, Water pollution, Water quality, Storage tanks, Reservoir storage, Combined sewers, Municipal water, Underground storage, Planning, Design, Settling basins, Remote control.

A system of in-system storage and off-line tanks for storm-water storage to help control discharges into the Illinois River from Peoria has been designed The plan recommends the use of underground covered storage reservoirs at eight locations with, where possible, remote control regulators. The level of control provided for in this system is an estimated 88% capture of the average annual overflow BOD. Spending twice the proposed investment would have resulted in removing only about 10% more BOD. For small storms, the in-system storage will be sufficient. If runoff continues after the in-system storage has been used up, the basin inlet gate will open to allow flow into the basin. If the storage capacity of Unit 1 is exceeded, Unit 2 will serve as the settling basin for flows up to the state requirement of at least 10 times Dry Weather Flow (DWF). If high runoff rates continue when the basin is already full, the operator may use both units as settling basins. Operating in this mode, at least 20 times DWF can be treated. This stormwater control project has been 'pre-certified' as an innovative/alternative technology by EPA and qualifies for 85% funding. (McKeon-FRC)
W81-00417

WATER FILTER DESIGN: WHAT TO LOOK FOR IN THE EIGHTIES,
K. Grover.
American City and County, Vol 95, No 6, p 39-40, 42-43, June, 1980. 6 Fig.

Descriptors: *Water treatment, *Filtration, *Activated carbon, *Filters, Flocculation, Water purification, Design, Coals, Odor, Taste, Turbidity, Sands, Organic wastes, Carbon filters.

Filter bed design is discussed with emphasis on depth of the filter box, contact time, granular activated carbon (GAC), anthracite beds, and coagulant control. Taste and odor is generally considered to be controlled in 3-4 min in a carbon bed as deep as a conventional coal bed (2-3 ft), and carbon regeneration need only be done every 2 or 3 yr when it is used for this purpose. Estimates, however, for the removal of synthetic organic contaminants range from 10 to 30 min, and most existing filter beds are not deep enough to allow

such long detention times. Studies in Australia have shown that 3 ft of anthracite coal in the filter achieved better turbidity removals than did 2 ft, but layers deeper than 36 inches did not perform significantly better than the 3-ft bed. Philadelphia has found that only the first 12 inches of carbon was active in their GAC filters, suggesting a similar limitation of optimum depth. Pilot tests at the Connecticut Water Company between GAC-sand-gravel, dual- and mixed-media filters have found that at a 6.0 gpm/sq ft filtration rate, the GAC-sand filter performed best. (McKeon-FRC)

DISINFECTION OF WATER TANKS,
A. T. Palin.
Water Services, Vol 84, No 1014, p 515-517, August, 1980. 2 Tab.

Descriptors: *Disinfection, *Chlorination, *Water tanks, *Cleaning, Water purification, Potable water, Chlorine, Bacteria, Microorganisms, Pathogenic bacteria, Costs, Water treatment, Measurement, Water quality control.

During cleaning, water-holding tanks are routinely flushed with heavily chlorinated water (about 10 mg/liter), which is then allowed to stand in the tank for about 2 hr. Residual chlorine in the tank should be 1 mg/liter, and the tank should be covered to prevent subsequent water pollution. This process is effective in eliminating pathogenic microorganisms. Suspended particulates in the rinse water may protect bacteria from the effects of the disinfectant, so it is vital to use clean water. Chlorine is the most widely used disinfectant for drinking water. To evaluate costs of commercial chlorine preparations, knowledge of their available chlorine content is necessary. Chlorine gas is suitable for large-scale use. Solutions contain the chemical form hypochlorite and their available chlorine content is up to 15%. Solid hypochlorites are generally produced as calcium compounds. Chlorinated lime has an available chlorine level of 30-35%. High Test Hypochlorite, a solid calcium hypochlorite in free-flowing granular or tablet form with a long shelf life, has an available chlorine content of 65-70%. Formulas for calculating the amount of disinfectant to be used are presented. To measure the amount of residual chlorine in a water supply, either the DPD or Chlorocol method may be employed. In the DPD method, the Lovibond comparator is used for comparison of the color of water samples, while the chlorocol one-tablet test is a simplification of the DPD method. These disinfection procedures may also be used for water mains and small reservoirs. Bacteriological tests may be performed to confirm disinfection. (Geiger-FRC)
W81-00424

PLANNED PROCESSING BEATS BACK WATER-PLANT SLUDGE DISPOSAL PROBLEMS,
Pirnie (Malcolm), Inc., Paramus, NJ.
G. P. Westerhoff, and G. C. Cline.
Water and Sewage Works, Vol 127, No 10, p 32-34, 36, 58-59, October, 1980. 3 Fig, 1 Tab, 16 Ref.

Descriptors: *Sludge disposal, *Pretreatment(Water), *Coagulation, *Dewatering, Flocculation, Suspended solids, Settling basins, Recycling, Solid wastes, Soil conservation, Reservoirs, Filtration, Water treatment, Costs, Sewage lagoons, Water sources, Water softening, Mechanical equipment.

Water treatment plant waste handling and disposal is becoming more expensive and difficult. Many plants can no longer discharge untreated sludge, but an acceptable method of solids disposal can cost 50% of the plant's operating budget. The objective of waste treatment should be to minimize the solids produced and to maximize the treatability of waste solids. During pretreatment, the possibility of developing new water sources with less turbidity, color, and/or hardness should be considered. Control of suspended solids through nutrient control and soil conservation can reduce solids production in reservoirs. Coagulant dosages can be reduced by optimizing the order of chemical additions, mixing, and flocculation. In softening plants, the quantity of sludges may be minimized by reducing the amount of chemical addition. Sludge collection is usually via sedimentation basin, from which solids are removed manually or mechanically. Filter backwash is treated by the storage and collection of solids in lagoons or liquid-solids separation basins with discharge of the supernatant or, alternatively, by recycling without solids removal (achieving zero discharge). The current trend in sludge treatment is toward dewatering by nonmechanical means because of the low cost. Where mechanical dewatering is cost effective, the trend is to use pressure filters for coagulant sludges and vacuum filters for lime-softening sludges. The use of regional sludge treatment may increase in the future. The development of new technologies in this area is necessary. (Gish-FRC)

REMOVAL OF ORGANICS IN WATER USING HYDROGEN PEROXIDE IN PRESENCE OF ULTRAVIOLET LIGHT,
Health and Welfare Canada, Ottawa (Ontario). Monitoring and Criteria Div.
M. Malaiyandi, M. H. Sadar, P. Lee, and R. O'Grady.
Water Research, Vol 14, No 8, p 1131-1135, August, 1980. 4 Fig, 2 Tab, 15 Ref.

Descriptors: *Water purification, *Ultraviolet radiation, *Oxidation, Organic wastes, Ozone, Gas chromatography, Water treatment, Analytical techniques, Laboratory tests, Potable water, Research and development.

Optimum conditions for the removal of dissolved organics from water intended for drinking or for high-purity research purposes were investigated using hydrogen peroxide and ultraviolet (UV) light as the purification techniques. When hydrogen peroxide is used under UV light, cleavage of the 0-0 bond yields hydroxyl (OH) radicals which are extremely reactive with most organic molecules with H-atom donor properties. In the present study, reactive OH radicals were generated in tap and distilled water samples using UV light of wavelength above the 200 nm system and a 50% hydrogen peroxide solution. The photochemically initiated OH radical oxidation decreased the total organic carbon (TOC) content of distilled water samples by about 88% and the TOC content of tap water by about 98%. Gas chromatographic analysis of hexane extracts of distilled and tap water samples before and after treatment for organic removal showed that approximately 12% of the electron-capturing residual organics were still present after hydrogen peroxide/UV light treatment. These findings show that water may be rendered nearly free of organic impurities by this relatively simple but efficient method. (Geiger-FRC)

5G. Water Quality Control

FURTHER INVESTIGATIONS OF ALUMINA-LIME-SODA WATER RECOVERY APPLICATIONS,
Midwest Research Inst., Kansas City, MO.
J. W. Nebgen, and G. D. Hinshaw.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-127326, Price codes: A04 in paper copy, A01 in microfiche. Final Report for Office of Water Research and Technology. October, 1980. 59 p, 5 Fig, 27 Tab, 6 Ref. OWRT-C-90005-S(No 9504)(1), 14-34-0001-9504.

Descriptors: *Water purification, *Trace elements, *Water chemistry, *Laboratory tests, *Water treatment, *Alkalinity, Analytical techniques, Research and development, Water analysis, Aluminum, Chemical reactions, Lime, Arsenic compounds, Chromium, Sulfates, Sulfur compounds, Inorganic compounds, Hydrogen ion concentration.

Findings of a laboratory study undertaken to define the range of applications of the alumina-lime-soda process have been reported. This process was effective for the removal of calcium sulfate at pH 12, and for the removal of dissolved silica in the pH range of 8.5-9 in earlier studies reported by Midwest, while emphasis of the present study was directed towards removal of trace constituents in water. The study findings revealed that oxygenated anions of toxic elements such as arsenic, selenium, and chromium (VI) behaved similarly to sulfate, and could be removed by alumina-lime-soda at pH 12. It was observed that borate ion could also be removed at pH 12, but only in the presence of sulfate. Furthermore, phosphate and color due to dissolved organic matter can be removed in the 8.5-9 pH range, using the same conditions as for removal of dissolved silica by alumina-lime soda. Heavy metals such as copper and zinc were also removed under these conditions. Mechanisms for removal of solutes by aluminum species generated during alumina-lime-soda treatment have been postulated. (Zielinski-IPA)

CONTROL OF POLLUTION IN WATERS CONTAINING HEAVY METALS,
Oklahoma State Univ., Stillwater. School of Civil Engineering.
D. F. Kincannon, M. H. Bates, and R. N. DeVries.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-124133, Price codes: A05 in paper copy, A01 in microfiche. Oklahoma Water Resources Research Institute, Oklahoma State University, Completion Report, September, 1980. 87 p, 31 Fig, 5 Tab, 64 Ref. OWRT-A-087-OKLA(1), 14-34-0001-8038.

Descriptors: *Heavy metals, *Water pollution sources, Lead, Chromium, *Pollutants, *Water pollution control, Water pollution, *Waste water treatment, Chemical wastes, Metals, *Oklahoma, Chemical reactions, Chemical precipitation, Pollutant identification, Analytical techniques, Activated sludge, Biodegradation, Soils, Soil chemistry, Sediments, Soil types.

An integrated set of experiments were carried out on the fate of chromium and copper in biological waste water treatment processes, aqueous environments, and soil systems. A rotating biological contactor and activated sludge were used as the waste water treatment processes; Stillwater, Oklahoma area lake and river water and sediments, as the aqueous environments; and sandy and red silty clay soils, as the soil systems. While it was determined that chromium was removed by the lake and river sediments but not generally removed by biological treatment processes or by algae, it was found that copper was removed by all systems. Removal efficiencies of the metals were highly dependent upon operating and environmental conditions. Sediments and soils had strong affinities for copper, and uptake could be correlated with soil type. Soluble copper reduction in aquatic systems occurred by precipitation. In general, the results indicated that copper is probably of less environmental concern than chromium since it is so readily removed by all systems studied. Heavy metal contamination of the environment can be minimized by proper management practices. Reduction of copper and chromium pollution in aqueous environments were deemed attainable by correct treatment choices, and an understanding of their fate in aqueous systems. (Zielinski-IPA)

SCALE REDUCTION IN PHYSICAL HYDRAULIC MODELS OF THERMAL DISCHARGES,
Clemson Univ., SC. Water Resources Research Inst.
B. L. Sill.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-126526, Price codes: A07 in paper copy, A01 in microfiche. Technical Report No 90, September 1980. 146 p, 31 Fig, 18 Tab, 19 Ref, 6 Append. OWRT-B-119-SC(1).

Descriptors: *Electric powerplants, *Thermal water, *Heat transfer, *Hydraulic models, *Water cooling, Physical hydraulic modeling, Thermal discharges, Scale reducting, Surface heat transfer, Surface heat exchange coefficients, North Carolina, Belews Creek Stream Station(NC), *Lake Belews(NC).

An experimental procedure is developed to study the behavior of the water-air heat transfer in indoor physical hydraulic models of thermal discharges. Using this procedure, the value of the indoor heat exchange coefficient is determined and used to calculate the allowable distortion of scale in a far field thermal discharge model. In preparation for an actual model study, scaling requirements were reviewed for the following far field processes: (a) convective spread, (b) turbulent dispersion, (c) head loss, and (d) surface cooling. The necessary distortion of scale differs for each of the different mechanisms, forcing researchers to ignore those that are less important. The theory and procedures developed were tested by modeling Lake Belews, a thermally loaded lake near Winston Salem, N.C. Because of limits to the allowable distortion of the vertical to horizontal scale ratio in the model, only a portion of the prototype could be modeled, emphasizing the need for a way to increase the allowable distortion by enhancing the water-air heat transfer in the indoor model. Results indicate that the proposed enhancement technique allows an increase in prototype area modeled and retains satisfactory accuracy of isotherm position and magnitude.

DEBRIS SEPARATION AND DISPOSAL SYSTEM,
A. J. Aman.
U.S. Patent No 4,189,386, 12 p, 16 Fig, 2 Ref; Official Gazette of the United States Patent Office, Vol 991, No 3, p 991, February 19, 1980.

Descriptors: *Patents, *Water pollution, *Water pollution treatment, Water quality control, Industrial water, Powerplants, *Intakes, Filters, Debris.

A system for the removal and disposal of debris from the water intake of power plants or the like is disclosed. The system includes a strainer basket having pivoted, separable sections movable from an abutting position to an open position. The sections are biased to the abutting position by gravitational forces acting upon the basket sections and their contents. The system further includes structure for opening portions of the basket to empty the contents into a suitable disposal recepticle. The opening device is positioned on the debris-receiving receptable and has cam surfaces for separating the basket sections. The object of this invention is to provide a bottom-emptying straining device which does not require latches or other mechanical fasteners to secure it in the closed position during straining and which will operate during freezing weather without the need for artificial heating. (Sinha-OEIS)

NOVEL COMPOSITIONS OF MATTER FOR USE IN THE TREATMENT OF AQUEOUS SYSTEMS,
Ciba-Geigy Corp., Ardsley, NY. (Assignee).
P. Miles, N. Richardson, and M. A. Finan.
U.S. Patent No 4,189,383, 6 p, 2 Tab, 12 Ref; Official Gazette of the United States Patent Office, Vol 991, No 3, p 990, February 19, 1980.

Descriptors: *Patents, *Water treatment, *Scaling, Water quality control, Industrial water, Chemical reactions, Hydraulic systems, Telomers.

The invention relates to telomeric compounds which show good control of calcium carbonate, calcium sulphate and magnesium hydroxide scales and more importantly modify the crystal structure of the scale so that it is non-uniform and easily removable. A method is provided for inhibiting scale formation from aqueous solutions over a wide range by adding a minor proportion of a product comprising a telomer of a formula which is disclosed. Examples illustrate how the formula may be used. (Sinha-OEIS)
W81-00373

WATER SOFTENING SYSTEM,
J. W. Braswell.
U.S. Patent No 4,181,605, 10 p, 10 Fig, 8 Ref; Official Gazette of the United States Patent Office, Vol 990, No 1, p 249, January 1, 1980.

Descriptors: *Patents, *Water treatment, *Water softening, *Demineralization, Iron exchange resins, Water quality control, Flow control, Instrumentation, Equipment, Backwash, Regeneration.

The water softening system employs a treatment tank containing a mineral bed of ion-exchange resin granules, a brine tank, and a valve for periodically cycling water through the mineral bed for removing hardness and other undesirable factors. A diluted brine solution is passed through the bed in a opposite direction to its normal service flow to recondition and flush the bed. The control for the system includes electrically operated solenoid diaphragm valves, and a plunger valve responsive to water pressures, for controlling and regulating the flow of water and brine through the mineral bed. A venturi aspirator is incorporated in the plunger valve, so that a saturated brine solution is drawn and with controlled dilution is caused to flow in a direction opposite to service flow through the mineral bed. (Sinha-OEIS)

WATER RESOURCES OF THE RIO GRANDE AN INTERDISCIPLINARY APPROACH,
New Mexico State Univ., Las Cruces.
R. R. Lansford.
In: A Quarter Century of Water Research. Proceedings of the Twenty-Fifth Annual New Mexico Water Conference. Apr. 24-25, 1980. WRRI Report No 124, Aug. 1980. p 59-63. New Mexico Resources Research Institute, New Mexico State University, Box 3167 Las Cruces, NM 88003.

Descriptors: *New Mexico, *Rio Grande, *Water management(Applied), *Water resources, *Project purposes, Project planning, Resources, Management, Coordination, Creativity, Project feasibility, Universities.

The strengths and results of interdisciplinary research were identified, regarding their application to water resources conservation, allocation and management in the Rio Grande area of New Mexico. Three projects were used as examples to illustrate how as many as seven different departments of three universities and scientific institutions developed the projects. The projects started from brainstorming sessions, progressed to the formative stages, were funded and produced successful results. The successful project format included using an advisory committee of diverse state and federal agency representatives, that met with the research staff on technical and policy questions. A contributing factor to the success of the projects was the dialogue brought about by research meetings that allowed members to receive technical language differences, and to develop meaningful task direction. The project results were methodology and criteria that can be applied to water management projects in similar semi-arid areas in the United States and the world. (Meade-Omniplan)

FEDERAL WATER LEGISLATION,
Senate Committee on Environment and Public Works (U. S. Senate).
H. Brayman.
In: A Quarter Century of Water Research. Proceedings of the Twenty-Fifth Annual New Mexico Water Conference. Apr. 24-25, 1980. WRRI Report No 124, Aug. 1980. p 181-191. New Mexico Resources Research Institute, New Mexico State University, Box 3167 Las Cruces, NM 88003.

Descriptors: *Legislation, *Water resources development, *State governments, *Planning, *Water policy, Expenses, Economic impact, Construction costs, Jurisdiction, Administrative agencies, Equitable apportionment, Projections

Federal spending for water resources projects is down about 50% from the mid-sixties. There are no priorities in the program; project selection is basically on an 'ad hoc' basis. Public support for water development programs is very low. Senator Peter Domenici development 3 criteria to improve the system: (1) try to find a way to put more money into the program; (2) create a system to select priorities; (3) broaden the constituency. Domenici introduced Bill S1241 which was later amended to 1660. The object of S1241 was to remove Congress from the individual selection and appropriation of projects; each state would perform that function. Four billion dollars a year for construction was allocated, to be distributed on a formula based half on the population of a state and half on land area. Amendment 1660, adopted by the Senate subcommittee on water, is a 5 year demonstration of the block allocation described in S1241, but with an allocation of $1 billion a year. This system would work in tandem with the existing line-item approach and provide a basis for future comparisons of the systems. No major project bills are expected in the next year. Some federal compromises might include: (1) more projects; (2) variation(s) on the Domenici-Moynihan block allocation system; (3) changes in the cost-sharing process in developing water projects. A research effort was mounted to develop and test social criteria for effective use in the water management and planning community. The research design employed a space-distance model which

involved factor analytical software for comparing empirical data generated from five community household samples. The machine output was then used to assess data relationships and to identify those social variables (i. e., those control points) which channel and direct other variables. Research results indicated: (a) that factor scores from Q-Sort factor analysis programming offer the water management and planning community a ready means for estimating, (i) interactive effects among social variables and (ii) which variables are the most probable controllers; (b) that presently, problems stemming from the softness of social data will be more effectively addressed by increasing quality control on data retrieval before increasing statistical refinement; (c) that action and communications variables as well as overall life goal structures appear to be strong candidates for control points; and (d) that effective action and communications patterns need to be distinguished sharply from affective action and communications patterns.

TENNESSEE-TOMBIGBEE CORRIDOR AREA: GROWTH FORECASTING AND MANAGEMENT,
Army Engineer District, Mobile, AL.
A. V. Galdis.
In: Proceedings, 14th Annual Mississippi Water Resources Conference, 24-25 September 1979. p 15-17 (1979) 3 Fig.

Descriptors: *Tennessee-Tombigbee Waterway, *Economic impact, *Regional economics, *Social impact, Employment, Social change, Planning, Management, Inland waterways, Kentucky, Tennessee, Alabama, Mississippi.

The area to be economically affected by the construction of the Tennessee-Tombigbee Waterway encompasses 48 counties in Alabama, Kentucky, Mississippi, and Tennessee and covers 29,300 square miles from the Ohio River to the Gulf of Mexico. Three Congressional resolutions were issued authorizing the Corridor Study to aid local communities, counties, and agencies with their planning needs. The economic studies are organized into two phases with several tasks in each phase. Phase One, the Pilot Studies, uses existing county level impact assessment models for four counties to analyze data needs for the investigations of the entire area. The two models used in this phase are the Economic Impact Forecasting System (EIFS) and the Social and Economic Assessment Model (SEAM). After the selection of analysis tools in Phase One, Phase Two, the studies for all 48 counties, will begin. Meetings will be held at planning agencies throughout the area to explain the analyses to residents and officials. Due to the high number of equally well-endowed sites along the waterway for industry, it is likely that site selection will be based on the will and ability of an area to solve problems associated with that site. INCOME DISTRIBUTION AND WATER RESOURCE PROJECTS: TESTING THE CLASSICAL THEORY OF ECONOMIC DEVELOPMENT,
Mississippi State Univ., Mississippi State. Dept. of Economics.
B. J. Eatherly.
In: Proceedings, 14th Annual Mississippi Water Resources Conference, 24-25 September 1979. p 19-21 (1979) 4 Ref.

Descriptors: *Regional economics, *Social impact, *Economic impact, Social change, Income distribution, Employment, Income analysis, Wages, Social values, Labor, Labor mobility, Employment opportunities, Capital, Land tenure.

Large-scale water resource projects provide something of a controlled social experiment and are an excellent opportunity for social scientists to learn more about the benefits and costs of industrial growth. Water resource projects produce a sudden flow of construction activity and ultimately change the sales and purchase opportunities for the residents of the area. Economic growth and its effect on social classes can be approached from the classical viewpoint of a closed society. Ownership arrangements in a society are important when the basis of economic growth is the production of a resource. Classical economics defines three groups of resources, land, labor, and capital. Classical economics are used to discuss these groups and their attitudes toward events such as a large-scale water project. It appears that contrary to the economic assessment, capitalists and laborers tend to favor such projects while landowners do not. A consideration of short-vs-long-run benefits or external effects can help to explain these attitudes. A brief discussion of labor migration is included. (See also W81-00290) (Seigler-IPA)
W81-00295

A FIELD TEST OF ENVIRONMENTAL IMPACT ASSESSMENT IN THE TENSAS BASIN,
Mississippi State Univ., Mississippi State. Dept. of Anthropology.
J. H. Peterson, C. A. Clinton, and E. Chambers.
In: Proceedings, 14th Annual Mississippi Water Resources Conference, 24-25 September 1979. p 27-32 (1979) 1 Fig, 5 Tab, 2 Ref.

Descriptors: *Louisiana, *Environmental effects, *Economic impact, *Social impact, Regional development, Planning, Regional analysis, Flood control, Channel improvement, Tensas River, Anthropology, Ecology, Engineering, Alternative planning.

A field test of Water Resources Assessment Methodology (WRAM) procedures was conducted at the Tensas River Basin project in northeastern Louisiana. WRAM is a procedure for assessing and evaluating impacts in the areas of economic development, environmental quality, regional development, and social well-being. The Tensas River Basin has a flooding problem and the project calls for extensive channel improvements along 99 miles of the river. Five alternative plans and a 'no action' alternative are being considered. WRAM requires the formation of an interdisciplinary team representing the areas of ecology, economics, engineering, and sociology/anthropology. A preliminary list of mandatory and critical variables is assembled and the variables are weighted. Data are then collected and analyzed for impact projection and sealing. Finally a summary table is constructed for each account listing each variable and its weight and impact for each alternative. It is concluded that the Tensas study was a useful test of the WRAM procedures. The use of the interdisciplinary team proved to be quite successful in that it allowed division of labor, a system of checks and balances, and duplication of effort was minimized. ANALYSIS OF RISK IN USING LAKE WATER SUPPLIES FOR SALMON HATCHERIES IN ALASKA,
Alaska Univ., Fairbanks. Inst. of Water Resources.
P. M. Fox, and R. F. Carlson.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-124125, Price codes: A02 in paper copy, A01 in microfiche. Completion Report 77-22-C, August, 1980. 18 p, 6 Fig, 7 Ref, 1 Append. OWRT-A-063-ALAS(1), 14-34-0001-8002.

Descriptors: Risks, Uncertainty, Analytical techniques, *Mathematical models, *Water supply, *Lake fisheries, *Alaska, *Salmon, Operations research, Computer models, Mode studies, Statistics, Statistical methods, Analysis, Lakes, Facilities, Estimating, Forecasting, Planning, Water resources.

The primary study objective of analyzing the risk of using northern lakes as a water supply for an extensive salmon hatching program was carried out by means of five sub-objectives. These ranged from the analysis of water supply needs of proposed salmon rehabilitation facilities with acceptable uncertainties in water quality parameters of established criteria; to use of the authors' northern lake model; to use of Baysian decision analysis techniques for risk and failure estimates. Planning strategies were considered. Lack of ample data imposed some limitations. It was concluded that it is possible to estimate basin streamflow with very little data. The reported method provided a viable solution. The developed methods can be used with spot discharge measurements and general information on the hydrologic pattern. This was the most common data situation. The results have potential benefit to those in coastal Alaska needing streamflow and lake water estimates, and provide an example of methods for incorporating risk and uncertainty into deterministic models. AN ECONOMIC ANALYSIS OF THE EFFECTS OF REGULATORY DELAY ON NUCLEAR POWER PLANT CONSTRUCTION,
Clemson Univ., SC. Water Resources Research Inst.
M. T. Maloney, and M. D. Walsh.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-124422, Price codes: A06 in paper copy, A01 in microfiche. Technical Report No 89, August 1980. 78 p, 3 Fig, 33 Ref, Append. OWRT-A-042-SC(1).

Descriptors: *Construction costs, *Nuclear powerplants, *Cost analysis, *Construction delay costs, Model studies, Economics, Governments, Regulation, Cost-benefit analysis.

In order to evaluate the impact that any government regulation has on society, an accurate measure of the costs imposed by the regulation is essential. Current government estimates of the cost of pollution control legislation have failed to include the costs of project delays that firms may experience when complying with such standards. Clearly, if these delays are the direct result of such legislation their costs should be included for a proper evaluation. The purpose of this report is to define and measure the true impact that construction deals have on the total project costs of a specific industry. The Nuclear Power Industry has been chosen to illustrate the problem. First, the industry is examined in terms of its economic and physical environment. A model is then developed to deal with the costs involved in the construction of a typical nuclear plant. The model is tested by regressing time and cost data of 31 completed plants to determine the impact that unanticipated delays have had on total project costs. These results indicate that such delays would increase the total project costs of a typical 1,000 mw plant by .8 percent per month in the initial stage of the project and 1.1 percent per month after actual construction begins.

6D. Water Demand

ESTIMATING IRRIGATION WATER QUANTITY AND QUALITY,

California Univ., Davis. Dept. of Civil Engineering.
O. J. Helweg, and D. Alvarez.
Journal of the Irrigation and Drainage Division, American Society of Civil Engineers, Vol 106, No IR3, Proceedings Paper 15712, p 175-188, September 1980. 13 Fig, 4 Tab, 6 Ref, 2 Append. OWRT A-060-CAL(3).

Descriptors: *Irrigation water, *Water demand, *Water supply, *Pricing, *California, Costs, Economics, Water management(Applied), Irrigation, Demand, Water quality, Salinity, Water values, Crops, Citrus fruits, Semiarid climates, Agriculture, Available water.

The value of water quantity and quality is shown by its demand curve (surface); but because the market for water is imperfect, the demand surface must be derived by other means. This paper shows a theoretical process for determining the derived demand surface for both water quantity and quality, using data for citrus crops in California. The results show that for the relevant price range, the demand for water quantity is relatively inelastic, indicating that pricing is not an attractive mechanism for controlling water distribution; however, the demand for water quality is relatively elastic which makes pricing a possible means for managing water quality. The results also support the claim that the value of water is considerably more than most irrigators pay for it. (Sims-ISWS)

6E. Water Law and Institutions

INDUSTRIAL COST RECOVERY: WHY IT SHOULD BE KILLED,
Philadelphia Water Dept., PA.
C. Guarino.
American City and County, Vol 95, No 6, p 57-59, June, 1980. 1 Fig.

Descriptors: *Industrial wastes, *Industrial water, *Municipal wastes, *Industrial Cost Recovery program, *Clean Water Act, Waste water treatment, Water conservation, Legislation, Industrial plants, Municipal water, Treatment facilities, Economic efficiency, Use rates, Water pollution.

The author recommends that the Industrial Cost Recovery (ICR) program, developed to avoid government subsidy of industrial water cleanup under the Clean Water Act of 1972, be discontinued because it has failed to meet its objectives and has become a hindrance to the implementation of the Clean Water Act. ICR was developed to ensure that no unfair competitive advantage would result from a company being connected to a municipal water system rather than treating its own wastes, but evidence indicates that this is a rare occurrence and that the imposition of ICR charges has in some cases resulted in companies withdrawing from municipal systems. ICR was also established to prevent the funding of municipal treatment systems with too much capacity due to the overestimation of industrial contributions, but this can be achieved through other channels, such as EPA grant regulations. Thirdly, ICR was designed to encourage industry to conserve water and to produce less waste water, but in industrial users do not cite ICR payments as a reason for conserving water. In addition, ICR is considered an inefficient way to collect revenue for local government, the management of local ICR systems is expensive, pretreatment programs are reducing the qualitative differences between industrial and domestic discharges so that there is no reason for industrial users to pay an extra charge, user charge systems are more efficient than ICR, municipalities with approved ICR systems have not elected to use them, and ICR does little for pollution control. (Gish-FRC)
W81-00259

TIME FOR A NEW CLEAN WATER PROGRAM,
R. A. Pavia.
American City and County, Vol 95, No 6, 53-54, June, 1980. 1 Fig.

Descriptors: *Clean Water Act, *Government finance, *Local governments, *Federal government, *Water pollution control, Legislation, Municipal water, Governmental interrelations, State governments, Waste water treatment, Costs, Use rates, Environmental Protection Agency, Administrative agencies.

The author considers that one way of limiting federal spending would be to return the Clean Water program to the local agencies responsible for the cleanup, as they can borrow money inexpensively through tax-free municipal bonds. Several program modifications are suggested to alleviate problems such as lack of funds and failure of new treatment plants to meet program specifications. These include authorizing funds for a 5-yr continuation of the waste water treatment grant program with a change in matching ratio to 67% federal-33% local, spelling out long-range objectives of the program, which will have waste-water agencies functioning as utilities responsible for operating and maintenance costs as well as financing new or replacement facilities, legislating mandatory reviews of existing water quality standards, and encouraging consolidation or regionalization of waste-water systems. The author also recommends establishment of a treatment technique advisory committee, accelerating dissemination of data, establishing teams of experts to recommend reforms to facilities not meeting performance standards, setting higher priorities for treatment applications or making projects in unsewered areas ineligible, considering making ineligible tertiary treatment projects and sewer-related projects, and re-evaluation of the role of each level of government The author stresses that the separation between the three levels of government should be restored; the sewerage construction grants program should be assigned to the states, and local government should be granted more freedom. GROUND WATER MINING AND WESTERN WATER RIGHTS LAW: THE NEBRASKA EXPERIENCE,
Nebraska Univ., Lincoln.
J. D. Aiken, and R. J. Supalla.
South Dakota Law Review, Vol 24, No 3, p 607-648, Summer 1979. OWRT B-045-NEB(No 8098)(1).

Descriptors: *Nebraska, *Groundwater mining, *Groundwater availability, Water rights, Groundwater, Legislation, Irrigation, Water allocation(Policy), Water users, Administrative agencies, Water conservation, *Groundwater management(Applied).

Depletion of ground water supplies due to irrigation is one of the major water policy questions facing the western states. Traditional responses have included ignoring the problem, or utilizing a supplemental water supply. Regulating ground water withdrawals has not been implemented, because it is perceived as too politically controversial. The 1975 Nebraska Ground Water Management Act (Act) is among the first administrative attempts to significantly reduce ground water withdrawals. The Act gives each local Natural Resource District (NRD) the option of regulating ground water use through the establishment of ground water control areas. Ground water controls authorized by the Act include: (1) well spacing restrictions; (2) rotation of pumping restrictions; (3) ground water allocation by establishing what quantities may be withdrawn; and (4) well drilling moratoria. In addition, an NRD may adopt other reasonable ground water controls. The Act also requires NRD's to establish and enforce regulations to control runoff from ground water irrigation. The blend of local and state responsibilities implicit in the Act has led to cooperation among state and local natural resource agencies and to an increased awareness of various aspects of ground water management. INDIANA FIVE-YEAR WATER RESOURCES RESEARCH AND DEVELOPMENT PLAN, FISCAL YEARS 1982-1986,
Purdue Univ., Lafayette, IN. Water Resources Research Center.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-121253, Price codes: A07 in paper copy, A01 in microfiche. Report submitted to Office of Water Research and Technology, 1980. 125 p, 2 Tab, 7 Append.

Descriptors: *Research priorities, *Indiana, *Water resources, *Water resources development, *Planning, *Water resources institute organizations, Water sources, State jurisdiction, State governments, Precipitation(Atmospheric), Hydrology, Water supply, Research and development, Groundwater, Water pollution, Water quality, Pollutants, Water reuse, Mining, Computer models.

The geographical location of Indiana is such that it receives an ample supply of water on an average annual basis through precipitation. However, substantial and generally unpredictable variations in the precipitation as the water supply source have direct and essentially immediate impacts whose seriousness depends on a number of factors. Indiana water resources problems have been categorized into six areas: (1) hydrologic and hydraulic processes; (2) planning and institutions; (3) water quality; (4) atmospheric and precipitation processes; (5) hydrologic-ecologic relationships; and (6) water supply, development and management. Fifty-three research priorities were determined for these six areas. The highest-ranked priority for each of these areas was, respectively: (1) study hydraulic characteristics of cast overburden from mined reclaimed areas; (2) improve detection, identification, decomposition, residual and trackin pollutant movements in ground/surface waters; (3) study methods of integrating flood plain management into a regional comprehensive land use planning process; (4) study ecological resonse to the seven day, one in ten year low flow design criteria; (5) develop mixed hydrologic-hydraulic computer models to forecast droughts, severe storms, and routing water through conveyances, including improved methodologies for reservoir management; and (6) evaluate direct/indirect impacts and benefits of urban water reuse applications, including industrial, agricultural, and municipal reuse. (Zielinski-IPA)
W81-00279

NORTH CAROLINA'S FIVE-YEAR WATER RESEARCH PROGRAM FOR 1982-1987,
North Carolina Water Resources Reserch Inst., Raleigh.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-121295, Price codes: A05 in paper copy, A01 in microfiche. October, 1980. 77 p, 6 Fig, 7 Tab, 33 Ref.

Descriptors: *North Carolina, *Research priorities, *Water quality, *Water quantity, Eutrophication, Fish kills, Estuaries, Drainage, Hydrology, Industrial wastes, Water pollution sources, Budgeting, Programs, Shellfish, *Five-year plans.

The rapid rate of industrialization, urbanization, and power growth in North Carolina has produced three major study and research areas of immediate concern: water resources planning and management, water quality management, and water quantity management. North Carolina's Water Resources Research Institute has selected these areas for the focus of its future concern. In water resources planning and management, estuaries and their develoment are a high priority due to the State's 2.2 million acres of estuaries. Fish kills, algal blooms, and shellfish water closings will receive atention in water quality research. Water quantity management will be highly concerned with hydrology and drainage. In all three research areas technology transfer will also be a priority The Institute will sponsor research based on relevancy to priority problems and scientific merit. Additional high priority areas include instream flow needs, energy/water relationships, stormwater management, pollutant identification, industrial wastes, groundwater pollution, and water quality standards. Recreation and irrigation are considered low priority research areas. Tables of proposed distribution of funds by budget activity and priority level are given for each year in the five-year program. (Seigler-IPA)

W81-00280

A 1982-87 RESEARCH PROGRAM FOR THE UNIVERSITY OF ILLINOIS WATER RESOURCES CENTER,
Illinois Univ. at Urbana-Champaign. Water Resources Center.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-121287, Price codes: A05 in paper copy, A01 in microfiche. Report submitted to Office of Water Research and Technology, October 13, 1980. 81 p, 2 Fig, 10 Tab.

Descriptors: *Illinois, *Research priorities, *Water allocation(Policy), Water quality, Water quantity, Budgeting, Eutrophication, Water pollution sources, Erosion, Flooding, Water shortages, Ecosystems, Floodplains, Silting, Irrigation water, *Five year plans.

Nine critical water problems are identified for Illinois: depletion of aquifers, lake siltation, sediment pollution, potential groundwater contamination, long-term health effects of water contamination, inadequate water treatment technology, the possible destruction of ecosystems, future irrigation demands, and the statewide diffusion of water authorities. Other problems are considered urgent such as: rural flooding, the lack of authority over floodplain management, advanced water treatment plant costs, regional water competition, and inefficient sewer designs. Problems classified as important are: urban flooding, water shortages, new water sources augmentation, water distribution system conservation, agricultural chemical pollution, hazardous wastes disposal, and channel conveyance legal problems. Precipitation in Illinois is variable ranging from 32 to 46 inches annually. Surface water quality is generally good with sedimentation from soil erosion a primary nonpoint source pollutant. Groundwater quality is also generally good. The most severe water shortages in the near future will be in the area around Chicago. To solve these problems, a program of research priorities and technology transfer is described. Projected annual funding requirements and allocations by priority are given. (Seigler-IPA)
W81-00281

A FIVE-YEAR PLAN FOR WATER RESOURCES RESEARCH IN ARIZONA,
Arizona Water Resources Research Center, Tucson.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-121279, Price codes: A04 in paper copy, A01 in microfiche. October 1980. 68 p, 5 Fig, 13 Tab, 12 Ref, 2 Append.

Descriptors: *Arizona, *Research priorities, *Groundwater depletion, Groundwater mining, Groundwater recharge, Water conservation, Water rights, Planning, Budgeting, Water reuse, Water pollution, Efficiencies, Information exchange, Agriculture, *Five-year plans.

Arizona's underlying water resources problem is the perennial overdraft of groundwater. The legal basis of water use is largely the key to this problem, but priority research is being designed to help. Future research will be aimed at: (1) greater efficiency of agricultural, industrial, and urban water; (2) broader implementation of water conservation measures and water reuse; and (3) ways of dealing both physically and legally with the continuing groundwater recharge/depletion imbalance. Water quality problems emphasis will be placed on the protection of groundwater and surface water, and on effective methods for monitoring and maintaining water quality standards. In all research areas, information dissemination will be a priority in order to realize the full potential of the benefits from the research. Three kinds of water depletion forecasts are given to estimate Arizona's water needs for 1970-2020. Arizona has 17 problem areas classified as 'very high priority'. An extensive table is given listing the priority problems and the research tasks needed to help solve them. Also given is a table of funding allocations for the priority areas at a $125,000 annual funding level and at a $250,000 annual funding level. (Seigler-IPA)

W81-00282

VERMONT WATER RESOURCES RESEARCH CENTER FIVE-YEAR PLAN FOR WATER RESOURCES RESEARCH AND DEVELOPMENT,
Vermont Water Resources Research Center, Burlington.
M. Long, and E. A. Cassell.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-123721, Price codes: A04 in paper copy, A01 in microfiche. October 1980. 53 p, 4 Fig, 9 Tab, 21 Ref.

Descriptors: *Vermont, *Research priorities, *Water resources, Planning, Acid precipitation, Water allocation(Policy), Waste water treatment, Hazards, Toxicity, Potable water, Public health, Electric power production, Surface runoff, *Five-year plan.

Vermont has identified eight priority research areas: (1) acid precipitation, (2) allocation of water resources, (3) data base for water resource management, (4) groundwater management, (5) lakes and wetlands management, (6) land runoff, (7) management of toxic and hazardous materials, and (8) waste water management and drinking water supply. Vermont has an average annual precipitation of 42 inches and is generally decentralized both culturally and hydrologically. This decentralization presents special management problems due to the economic limitations on small communities in the provision of facilities for water supply and waste water treatment. Some problems such as acid precipitation and toxic and hazardous materials management originate outside of the State and need regional research efforts. Energy production significantly impacts Vermont's water use with 70% of total use since 1975 being attributed to cooling at electric production facilities. Major factors in the State's five-year plan are vigorous technology transfer and information dissemination efforts. A generic listing of research projects and technology transfer activities considered necessary for Vermont is presented along with a table showing the interrelationships of the various program elements and the research projects. (Seigler-IPA)
W81-00283

FIVE-YEAR WATER RESOURCES RESEARCH PROGRAM,
Kentucky Water Resources Research Inst., Lexington.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-121261, Price codes: A04 in paper copy, A01 in microfiche. October 1980. 66 p, 5 Tab, 22 Ref.

Descriptors: *Kentucky, *Research priorities, *Water quality, *Water quantity, Budgeting, Flood forecasting, Eutrophication, Acid mine water, Coal mines, Industrial water, Allotments, Water resources, Grants, Agriculture, Groundwater resources, *Five-year plans.

Kentucky's water resource problems are grouped into two large areas, water quntity and water quality. The State's water quality is in general good with moat streams being the calcium bicarbonate type. Kentucky has a statewide average rainfall of 45 inches per year and groundwater is plentiful in many parts of the State. Farming uses about 71 billion gallons annually; municipal, 71 billion gallons annually; and industry 220 billion gallons annually. Despite the current plentiful supply of water in Kentucky, problems do exist such as pollution, flooding, water hardness, erosion, acid mine drainage, and iron in the water. Five large priority areas with specific research needs have been selected to guide in problem solving. Those areas are: (1) coal development, which will require large amounts of water for extraction and processing; (2) hydrological extremes, flooding and droughts are regional occurrences and better forecasting and management are needed; (3) agriculture and forestry, which consume large quantities of water, and are also major sources of nonpoint pollution; (4) water quality, research is needed on siltation, eutrophication, acid rainfall, pollutant transport, and groundwater pollution; and (5) the development of water allocating strategies and industrial plant siting guidelines. A five year budgeting plan for these research priorities is included. (Seigler-IPA)
W81-00285

FIVE-YEAR WATER RESOURCES RESEARCH AND DEVELOPMENT GOALS AND OBJECTIVES,
Missouri Water Resources Research Center, Columbia.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-121311, Price codes: A04 in paper copy, A01 in microfiche. Report submitted to Office of Water Research and Technology, October, 1980. 70 p, 13 Fig, 7 Tab.

Descriptors: *Missouri, *Research priorities, *Water quality, *Mississippi River, *Missouri River, Irrigation water, Recreation, Sewage treatment, Flood control, Energy, Mining, Budgeting, Planning, Programs, *Five-year plans.

Missouri, a state with generally abundant but varied water resources, has selected nine priority areas for research during the next five years: (1) water quality, (2) supplemental irrigation, (3) water for recreation, (4) cutting costs of sewage treatment by reducing water use, (5) impact of energy development on water, (6) impact of mineral development on water, (7) fundamental water science, and (8) flood control. Missouri is in the western-most tier of States with a generally adequate water supply. Its two major rivers, the Missouri and the Mississippi, have a major influence on the economy of the area. Missouri has a continental climate with average annual precipitation ranging from 32 to 48 inches. Water problems are categorized in terms of the Federal Coordinating Council for Science and Engineering Technology Listing of Water Resources Research Categories. Approximately 50% of the priorities are in the water quality field, 30% in planning, and 20% in the other categories. While research in the priority areas will be encouraged, mediocre research will not be permitted just because it is in a priority area. A table is included giving estimations of the use of Annual Cooperative Funding, at two levels, in each of the priority areas for the next five years. (Seigler-IPA)
W81-00286

A FIVE-YEAR PLAN FOR WATER RESOURCES RESEARCH FOR TEXAS,
Texas Water Resources, Inst., College Station.
J. R. Runkles, and J. G. McNeely.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-121303, Price codes: A05 in paper copy, A01 in microfiche. Report TR-110, October, 1980. 90 p, 5 Fig,l 9 Tab.

Descriptors: *Research priorities, *Texas, *Research and development, *Water resources development, *Water management(Applied), *Groundwater, Planning, Project planning, State jurisdiction, Water conservation, Water use, State governments, Water quality, Water supply, Flooding, Small watersheds, Water shortage, Water requirements, Water resources, Rural areas, *Five-year plans.

Present water resources uses exceed current supply by 1.2 million acre-feet (maf) and annual groundwater use exceeds the safe and firm groundwater yield by 7.1 maf. Population growth rate and its increased strain on limited water resources is a major water problem facing the State. Perceived water resources problems were categorized under flooding, groundwater depletion, water quality, and water supply and quality for small cities and rural communities. Thirteen research priorities for the Institute for the next five years were established by the Water Resources Officials Advisory Committee. The seven highest priorities were translated into specific research sub-areas and the five-year funding strategy was developed. The seven identified priorities in priority order were: (1) water conservation in agriculture; (2) drought management and related water supply disruptions; (3) groundwater management; (4) energy and water; (5) groundwater quality protection; (6) economics of surface water development and use; and

(7) flood plain management. Two-to-three research sub-areas were identified for each of the seven categories. (Zielinski-IPA)
W81-00287

THE ALLOCATION OF WATER TO INSTREAM FLOWS, VOLUME I: A COMPARATIVE STUDY OF POLICY MAKING AND TECHNICAL INFORMATION IN THE STATES OF COLORADO, IDAHO, MONTANA, AND WASHINGTON,
Lewis and Clark Coll., Portland, OR. Natural Resources Law Inst.
J. L. Huffman, M. Berry, N. Brown, N. P. Lovrich, and J. C. Pierce.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-138125, Price codes: A04 in paper copy, A01 in microfiche. Final Report to the Office of Water Research and Technology. July, 1980. 24 p, 2 Fig. OWRT-C-80093-P(No 8403)(1), 14-34-0001-8403.

Descriptors: *Streamflow, *Colorado, *Idaho, *Montana, *Washington, Decisionmaking, *Water allocation(Policy), Water law, Surveys, Administrative decisions, Flow, Evaluation, Assessments, Information retrieval, Data collections, Water balance, Reviews, Documentation, Governments, Legislation.

This report, set out in five volumes, examined the impact of alternative institutional approaches for the allocation of water to instream flows, with particular examination of the role of technical information in State decision-making processes for Colorado, Idaho, Montana, and Washington. The study methods used structured interviews in Colorado and Idaho, unstructured interviews in Colorado, Montana, and Washington, and examinations of records of public agencies. This volume, Volume I, defined the scope of the overall study, presented the cumulative contents of the five volumes, and a preliminary comparative assessment for instream flow protection in the four States. The critique of the existing processes was a general one, applicable to most government decision-making on resource allocation issues. However, it was concluded that the problem was a very real one which States should address. Failure to separate technical and policy questions results in neither issue type being adequately addressed. Technical information cannot do more than inform policy makers of the probable consequences of alternative policies. Selection among policy alternatives can only be done on the basis of some measure of the values of the society that will experience the costs/benefits of the policy decision. (Zielinski-IPA)

THE ALLOCATION OF WATER TO INSTREAM FLOWS, VOLUME II: COLORADO WATER RESOURCES MANAGEMENT,
Lewis and Clark Coll., Portland, OR. Natural Resources Law Inst.
J. L. Huffman, and M. P. Berry.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-138133, Price codes: A07 in paper copy, A01 in microfiche. Final Report to the Office of Water Research and Technology, July, 1980. 97 p, 2 Fig, 24 Tab, 197 Ref, 3 Append. OWRT-C-80093-P(No 8403)(2), 14-34-0001-8403.

Descriptors: *Streamflow, *Colorado, *Water management(Applied), Water resources, *Water law, Surveys, Decisionmaking, *Water allocation(Policy), Administrative decisions, Flow, Evaluation, Assessments, Information retrieval, Data collections, Water balance, Reviews, Documentation, Governments, Legislation, Legal review.

This report represented Volume II of a five-volume report on the topic of water allocation to instream flows; the overall study also including the States of Idaho (Volume III), Montana (Volume IV), and Washington (Volume V). The overall study examined the impact of alternative institutional approaches for the allocation of water to instream flows: (1) a summary of Colorado water law with emphasis on its relation to instream flow protection; (2) results of a survey of the principal participants (judges, water referees, water lawyers) in Colorado private water rights system implementation; (3) an examination of minimum streamflow law, its history and constitutional challenges to its implementation; (4) a discussion of minimum flow law implementation; and (5) conclusions concerning operation of minimum flow law within the Colorado general appropriative rights system. Results of the survey indicated that, in general, judiciary principals were satisfied with their system of allocating water. In discussion of Colorado Senate Bill 97, it was felt that successes, from the viewpoint of those desirous of instream flow protection, have come principally from efforts of Water Conservation Board, Division of Wildlife, and Office of Attorney General individuals. (Zielinski-IPA)

THE ALLOCATION OF WATER TO INSTREAM FLOWS, VOLUME III: IDAHO WATER RESOURCES MANAGEMENT,
Washington State Univ., Pullman. Dept. of Political Science.
J. C. Pierce, N. P. Lovrich, Jr., and A. Cook.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-138141, Price codes: A10 in paper copy, A01 in microfiche. Final Report to the Office of Water Research and Technology, July, 1980. 145 p, 3 Fig, 46 Tab, 179 Ref, 6 Append. OWRT-C-80093-P(No 8403)(3), 14-34-0001-8403.

Descriptors: *Streamflow, *Idaho, *Water management(Applied), Water resources, *Water law, Surveys, Decisionmaking, *Water allocation(Policy), Administrative decision, Flow, Evaluation, Assessments, Information retrieval, Data collections, Water balance, Reviews, Documentation, Governments, Legislation, Legal review.

This report represented Volume III of a five-volume report on the topic of water allocation to instream flows; the overall study also including the States of Colorado (Volume II), Montana (Volume IV), and Washington (Volume V). The overall study examined the impact of alternative institutional approaches for allocation of water to instream flows. The Idaho section (Volume III) of this report examined the role of technical information in Idaho water resources management policy-making processes, and the degree to which policy preferences of the public were reflected in preferences of political activists and Idaho State legislators. Special questionnaire surveys were conducted, with response efficiencies of 68 to greater than 70 percent. The level of information holding was found to be generally distributed across legislature, independent of political/environmental orientation of the individual members. Also, it appeared that evaluations of technical information by legislators were extremely political, with legislators trusting information derived from sources most closely matching their own. Three representative groups of attentives in the public were identified. Not only the magnitude of the differences, but the direction as well, was relatively consistent between the groups. (Zielinski-IPA)

THE ALLOCATION OF WATER TO INSTREAM FLOWS, VOLUME IV: MONTANA WATER RESOURCES MANAGEMENT,
Lewis and Clark Coll., Portland, OR. Natural Resources Law Inst.
J. L. Huffman.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-138158, Price codes: A12 in paper copy, A01 in microfiche. Final Report to the Office of Water Research and Technology, July, 1980. 197 p, 4 Fig, 16 Tab, 191 Ref, 7 Append. OWRT-C-80093-P(No 8403)(4), 14-34-0001-8403.

Descriptors: *Streamflow, *Montana, *Water management(Applied), Water resources, *Water law, Surveys, Decisionmaking, *Water allocation(Policy), Administrative decisions, Flow evaluation, Assessments, Information retrieval, Data collections, Water balance, Reviews, Documentation, Government, Legal review, Legislation.

This report represented Volume IV of a five-volume report on the topic of water allocation to instream flows; the overall study also including the States of Colorado (Volume II), Idaho (Volume III), and Washington (Volume V). The overall study examined the impact of alternative institutional approaches for the allocation of water to instream flows. The Montana report (Volume IV) on this study covered an examination of Montana water law; topics of minimum flow preservation under Montana law, the Yellowstone Reservation hearings, municipal reservations, agricultural applications, and instream applications; a discussion of the overall legal process; and an assessment of the future of water reservations in Montana. Twenty principal recommendations of this study were made in six categories: the law, technical issues, process design, role of the Board of Natural Resources and Conservation, reservation orders, and the reservation issue. Recommendation under the law category urged the Board continue its policy-making function in implementing the reservation statute and take a broad and aggressive approach in review of established reservations; and under technical data, such data should be format-structured to allow the Board to assess probable impacts of alternative reservation decisions. (Zielinski-IPA)

THE ALLOCATION OF WATER TO INSTREAM FLOWS, VOLUME V: WASHINGTON WATER RESOURCES MANAGEMENT,
Lewis and Clark Coll. Portland, OR. Natural Resources Law Inst.
N. C. Brown, and P. S. Wassenberg.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-138166, Price codes: A05 in paper copy, A01 in microfiche Final Report to the Office of Water Research and Technology, July, 1980. 54 p, 9 Fig, 6 Tab, 104 Ref, 3 Append. OWRT-C-80093-P(No 8403)(5), 14-34-0001-8403.

Descriptors: *Streamflow, *Washington, *Water management(Applied), Water resources, *Water law, Surveys, Decision making, *Water allocation(Policy), Pacific Northwest U.S., Administrative decisions, Flow, Evaluation, Assessments, Information retrieval, Data collections, Water balance, Reviews, Documentation, Governments, Legislation, Legal review, Pacific coast region.

This report represented Volume V of a five-volume report on the topic of water allocation to instream flows; the overall study also including the States of Colorado (Volume II), Idaho (Volume III), Montana (Volume IV). The overall study examined impact of alternative institutional approaches for the allocation of water to instream flows. The State of Washington report (Volume V) on this study covered Washington State water law, past and present status of instream flows, the Western Washington Instream Resources Protection Program (WWIRPP), the controversy on protecting versus preserving fishery resources, Federal and Indian reserved rights, State resource management of the Columbia River, and the Columbia River Instream Resources Protection Program (CRIRPP). A summary of findings covering the study areas was presented. Decisions by Washington State decision-makers on instream flows appeared to be based more on scientific than political factors, but political influences were judged involved in the process (such as the Department of Energy, DOE, establishment of instream flows on streams and lakes, initiated by the Washington legislature). The rapid development and implementation of the WWIRPP and CRIRPP activities demonstrated that DOE action over the last two years has established instream flows as a high priority. (Zielinski-IPA)
W81-00321

A FIVE-YEAR PLAN FOR WATER RESOURCES RESEARCH AND ASSOCIATED TECHNOLOGY TRANSFER NEEDS,
Idaho Univ., Moscow. Water Resources Research Inst.

C. C. Warnick, and W. Reynolds.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-124489, Price codes: A02 in paper copy, A01 in microfiche. Report submitted to the Office of Water Research and Technology, October 1980. 22 p, 18 Ref, 1 Append.

Descriptors: *Idaho, *Research priorities, *Water conservation, Volcanoes, Irrigation water, Social impact, Environmental effects, Groundwater recharge, Energy, Wildlife, Fish passages, Planning, Water demand, Flow characteristics, *Five-year plans.

Idaho has identified five categories of research priorities: energy, irrigated agriculture, environmental, institutional and social, and water conservation. Energy related research will include the evaluation of specific pumped storage sites, new technology for moderate to low temperature geothermal water, and the development of more sophisticated river and reservoir management models. Irrigated agriculture research will include erosion control groundwater recharge, cost and energy effectiveness, irrigation practices, and irrigation facilities. Included in environmental research will be specific wildlife habitat requirements, volcanic ash impact, improved fish passages at dams, the defining of instream flow requirements, and the evaluation of Idaho lake ecosystems. Institutional and social concerns will include attitude evaluations, water right policies and laws, and the effectiveness of various administrative units. Water conservation research will include the potential for artificial aquifer recharge, the impacts of alternative water conservation policies, and improved methods for predicting irrigation water demands. Technology transfer will be a major concern in all five of the priority areas. (Seigler-IPA)
W81-00330

WATER RESOURCES RESEARCH FIVE-YEAR PLAN/1982-1987,
North Dakota Water Resources Research Inst., Fargo.
L. Lubka.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-124497, Price codes: A05 in paper copy, A01 in microfiche. Report submitted to the Office of Water Research and Technology, 1980. 71 p, 1 Fig, 8 Tab, 24 Ref, 1 Append.

Descriptors: *North Dakota, *Research priorities, *Planning, *Research and Development, *Water management(Applied), *Water utilization, Wetlands, Genetics, Crop response, Groundwater availability, Waste water(Pollution), Flood plains, Flood plain zoning, Flood control, Water conservation, Water distribution(Applied), Institutions, Optimum development plans, Water policy, Water supply, *Five-year plans.

This report has outlined the water resources background of North Dakota, including geology, hydrology, meteorology, water data availability, and problem awareness. Trends in water consumption, water-related problems, and the significant recent studies concerning water and land resources were examined. Identified problem areas were: inadequate surface water supply; overdraft of groundwater; pollution of surface water; pollution of groundwater; drinking water quality; flooding; erosion and sedimentation; and wetlands. A review of these problem areas led to a ranking of seventeen North Dakota problem categories/research priorities. The highest ranked of these was flood plain management, which was the highest ranked topic for relevance to State problems, capability of State to conduct research, probability of making a significant contribution, and cost/benefit. Flood plain management was followed in ranking order by water conservation; genetic engineering of agricultural plants; waste water management; groundwater management; water distribution; stream flow; wetlands management; land-use planning; public participation/information dissemination; institutional framework; saline water; geothermal water; weather modification; nature of water; acid rain; and hydroelectric power. (Zielinski-IPA)
W81-00331

FIVE YEAR RESEARCH PLAN, 1982-1987,
Kansas Water Resources Research Inst., Lawrence.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-124505, Price codes: A04 in paper copy, A01 in microfiche. Report submitted to the Office of Water Research and Technology, October 1980. 67 p, 8 Fig, 4 Tab, 19 Ref.

Descriptors: *Kansas, *Research priorities, *Water conservation, *Water quality, Management, Grants, Budgeting, Pumping, Irrigation water, Enchroachment, Saline water, Toxicity, Planning, Arkansas River, *Five-year plans.

Kansas has a research program focused on water conservation, water quality protection, water management, and basic research. The State's annual precipitation averages between 17 and 40 inches depending upon location. This gives approximately 105 million acre-feet from precipitation annually. Kansas uses about 5.5 million acre-feet of its annual pumpage of 7 million acre-feet for irrigated agriculture. Aquifers are gradually being depleted as recharge is not keeping up with demand, especially in the western part of the State. Shallow wells drilled along streams have caused some, such as the Arkansas River, to cease flowing most of the year. Salt intrusion is also becoming a problem due to heavy pumping in areas such as Wichita. Conservation research will involve agriculture, industry, municipalities, recreation, wildlife, and fisheries. Water quality studies will include the sources and pathways of toxic chemicals, salt water intrusion, best management for stream quality, and sedimentation. Issues to be studied under water management include: legal and institutional aspects; economic, political, and social impacts; and interactions in hydrologic systems. It is projected that funding will go 28.6% to water conservation, 28.6% to water quality protection, 28.6% to water management, and 14.2% to basic research. (Seigler-IPA)
W81-00332

FIVE-YEAR WATER RESEARCH AND DEVELOPMENT PLAN FOR GUAM AND MICRONESIA FY 82 THROUGH FY 86,
Guam Univ., Agana. Water Resources Research Center.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-125122, Price codes: A05 in paper copy, A01 in microfiche. Report, submitted to the Office of Water Research and Technology, October 1980. 78 p, 9 Fig, 6 Tab, 198 Ref.

Descriptors: *Guam, *Research priorities, *Saipan, *Micronesia, Limestone, Groundwater, Islands, Planning, Projects, Pacific Ocean, Tropical regions, Hydroelectric power, Volcanoes, Waste water treatment, Water demand, *Five-year plans.

A common problem and water research priority for Guam, Saipan, and Micronesia is groundwater yield. Guam gives secondary priority to baseline water quality data and the impact of pollutants on receiving water quality. Tertiary priorities for Guam are water demand, potential conflicts over surface water use, and the feasibility of low-head hydroelectric power generation. Saipan gives secondary priority to baseline water quality data and Micronesia gives secondary priority to the operation of waste water treatment plants and conservation. Guam is within the tropical belt and is the largest of the Mariana Islands with a land area of about 212 sq mi. Northern Guam has a broad limestone plateau and the southern half is a dissected volcanic upland fringed with limestone. These limestone areas have high hydraulic conductivity and porosity. Almost all residences on Guam are served by the public water system with a total productivity from all sources of 28.5 million gallons per day. The five-year plan includes information on the problems to be researched, the five-year schedule, and the distribution of funding among the projects based on two levels of Annual Cooperative Funding: $115,000 and $250,000. (Seigler-IPA)
W81-00333

FIVE YEAR RESEARCH AND DEVELOPMENT PLAN FOR THE RHODE ISLAND WATER RESOURCES CENTER,
Rhode Island Univ., Kingston. Water Resources Center.
W. E. Kelly.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-124182, Price codes: A03 in paper copy, A01 in microfiche. Report submitted to the Office of Water Research and Technology, September 1980. 28 p, 3 Fig, 1 Tab, 7 Ref.

Descriptors: *Rhode Island, *Research priorities, *Hazardous wastes, *Urban runoff, Research facilities, Planning, Technology transfer, Flooding, Water shortages, Groundwater, Water supply, Human population, Reservoirs, *Five-year plans.

Rhode Island will focus its research on urban runoff, hazardous waste, and technology transfer. Rhode Island, the smallest State, is one of the most densely populated. Many of today's water problems are left from early industrial development based on relatively abundant waterpower. Major rivers are the Branch, the Blackstone, the Woonasquatucket, the Pawtuxet, the Potowomut, the Moosup, the Tenmile, the Warren, the Pawcatuck, and the Saugatucket. Average annual precipitation varies from 40 to 50 inches depending on location. Seventeen groundwater reservoirs have been identified. Chronic water shortages exist in the southeastern part of Rhode Island while flooding is a problem in the Pawtuxet and Blackstone River Valleys. A multi-disciplinary approach will be used to coordinate research in the areas of runoff and hazardous waste. There is very little research on-going on the number one problem of hazardous waste. Funding at two different levels is shown for the major categories and subcategories in the Five-Year Research Plan. (Seigler-IPA)
W81-00334

FIVE-YEAR PLAN FOR THE LOUISIANA WATER RESOURCES RESEARCH INSTITUTE, 1980-85,
Louisiana Water Resources Research Inst., Baton Rouge.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-124190, Price codes: A02 in paper copy, A01 in microfiche. Report submitted to the Office of Water Research and Technology, October 1980. 14 p, 2 Fig, 2 Tab.

Descriptors: *Louisiana, *Research priorities, *Research facilities, *Project planning, Institutions, Waste water disposal, Water conservation, Desalination, Water reuse, Water law, Environmental effects, Subsidence, Aquifer management, *Five-year plans.

Thirteen priority water research areas are identified for Louisiana: (1) effects of surface waste water disposal, (2) deep well waste disposal, (3) water conservation, (4) desalting, (5) water reuse, (6) energy-related water use, (7) groundwater, (8) aquifer management, (9) urban water, (10) environmental protection, (11) rural water, (12) water law, and (13) subsidence. A five year funding summary of the probable minimum expansion of work at the Institute is given along with a five year projection of staff and space requirements. Current research projects at the Institute totaling $349,507 include: Algae Removal by Fine Sand/Silt Filtration, Impact of Lignite Mining on Water Resources in Louisiana, Stochastic Analyses of Predictive Biochemical Oxygen Demand Kinetics, and Utilization of the Lime Byproduct from Water Softening for Waste Water Treatment. A list of 51 current Institute publications is attached. (Seigler-IPA)
W81-00335

FIVE-YEAR PLAN OF THE PUERTO RICO WATER RESOURCES RESEARCH INSTITUTE,
Puerto Rico Univ., Mayaguez. Water Resources Research Inst.
R. M. Candelario.
Available from the National Technical Information

Service, Springfield, VA 22161 as PB81-126542, Price codes: A05 in paper copy, A01 in microfiche. Report submitted to the Office of Water Research and Technology, October, 1980. 90 p, 21 Fig, 24 Tab, 15 Ref.

Descriptors: *Puerto Rico, *Research priorities, *Research and development, *Planning, *Water management(Applied), *Water utilization, Water resources development, Water supply, Water quality, Water reuse, Water distribution(Applied), Institutions, Water policy, Optimum development plans, Toxins, Water pollution, Water purification, Water balance, Waste water(Pollution), Basins, *Five-year plans.

Preparation of this plan has responded to the mandate of the Water Research and Development Act of 1978 (P.L. 95-467). Both surface and groundwater supplies were deemed adequate for existing/future needs, but current planning and management practices are inadequate, and water shortages often arise in the agricultural/industrial/municipal sectors. The most urgent needs in water resources research in Puerto Rico were identified as lying mainly within the general categories of management, quality and reuse of water. The identified high-priority research problems to be investigated by the Institute during the five-year period were placed under five different categories: (1) atmospheric, hydrological, and hydraulic processes; (2) hydrological-ecological relationships; (3) water quality management and protection; (4) water development, use, conservation and management; and (5) institutional and economic analysis and water resource planning. Identified high-priority research problems included: water balances and models for basins (under category 1); land application of waste waters (category 2); hydrologic cycle toxic/hazardous pollutant identification (category 3); reuse options for waters of impaired quality (category 4); and island-wide total water resources management plan (category 5). (Zielinski-IPA)
W81-00336

NEBRASKA WATER RESOURCES CENTER FIVE-YEAR WATER RESOURCES RESEARCH PROGRAM, 1982-1987,
Nebraska Water Resources Center, Lincoln.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-124356, Price codes: A06 in paper copy, A01 in microfiche. Report submitted to the Office of Water Research and Technology, October, 1980. 86 p, 13 Fig, 2 Tab, 26 Ref.

Descriptors: *Nebraska, *Research priorities, *Research and development, *Water resources development, *Planning, *Water management(Applied), *Water utilization, Water supply, Water quality, Groundwater, Groundwater availability, Optimum development plans, Crops, Precipitation(Atmospheric), Water distribution(Applied), Surface waters, Surface-groundwater relationships, Institutions, Water policy, Groundwater resources, *Five-year plans.

Nebraska ground and surface water systems were estimated to contain approximately two billion acre-feet of water, and its long-term average precipitation to be 86 million acre-feet. Despite abundant water resources, not all areas of the State have an adequate or useful water source. Nebraska State water problems have been identified under five categories: water quantity; water quality; distribution and redistribution; water use efficiency and productivity; and legal-institutional. Some State areas have limited groundwater and no access to lakes/streams. Nebraska's Section 208 Water Quality Management Plan lists eleven sources of State water quality problems, with sedimentation identified as the most important. Water distribution problems result from climatic variability and differential access to State water supplies. A greater research effort is needed to use species of crops which are more water efficient to enhance overall water use efficiency/productivity. While legal-institutional arrangements provide the framework for water resources utilization and management, Nebraska has no current statutory/constitutional basis for establishing groundwater ownership, and public management systems do not recognize the interrelationships between ground and surface water. Nineteen specific research topics were developed to address the identified priority Nebraska water resources problems. (Zielinski-IPA)
W81-00337

WATER RESOURCES RESEARCH SUPPORT PROGRAM 1979-1980,
Inland Waters Directorate, Ottawa (Ontario).
1980, English and French, 14p.

Descriptors: *Water resources, *Research, Sediments, Pollutants, Groundwaters, *Canada, *Universities, Hydrologic modelling, Hydraulics, *Water systems, Data collection, Technology, Snow, Ice.

The Department of the Environment, on the recommendation of the Water Resources Research Support Program Review Group, has agreed to provide a total of $250,000 for water-related environmental research during 1979-80 to the Canadian university research community. The Water Resources Research Support Program provides for innovative research relevant to departmental concerns and responsibilities for water resources research in the natural and social sciences with emphasis on water management issues. By fostering the interest of university researchers, it thereby utilizes their knowledge and expertise in solving water research problems and provides opportunities for their participation in socially relevant environmental research. Sixteen universities across Canada will share the $250,000 which will be used to support interdisciplinary research programs aimed at solving regional and national water research issues. The areas of study and the institutions involved are included. (WATDOC)

WATER RESOURCES RESEARCH - THE EARLY YEARS,
New Mexico State Univ., Las Cruces.
H. R. Stucky.
In: A Quarter Century of Water Research. Proceedings of the Twenty-Fifth Annual New Mexico Water Conference, Apr. 24-25, 1980. WRRI Report No 124, Aug. 1980. p 7-19. New Mexico Resources Research Institute, New Mexico State University, Box 3167 Las Cruces, NM 88003.

Descriptors: *New Mexico, *Research and development, *Water Resources Research Act, *Water resources development, *Water supply, Institutions, Conference, Legislation, Planning, Prior appropriation, Water rights, Surface water.

Water is required by all life and influences all factors of the environment. All segments of society must share in the proper use of water and the control of pollution. Partial solutions to water resources problems have been started but much multidisciplinary research is necessary. Archaeologists have found centuries-old evience of water management by the Indians in New Mexico. The principles of prior appropriation---public ownership of surface water with rights assigned by prior appropriation and beneficial use---were applied to groundwater in 1931 by New Mexico law. Senate Bill S-2, the Water Resources Research Act of 1964, was signed on July 17, 1964 and established Water Resources Research Centers in each of the 50 states and Puerto Rico. These institutes began adding to the research already conducted by the Agricultural and Engineering Experimental Stations and various government and private agencies. One year prior, in 1963, the New Mexico State University Water Research Institute was authorized and thus became the first state institute in the nation. The first 8 annual New Mexico Water Conferences, from 1956-1963, were the forerunners of the Institute. The Institute's statewide responsibilities, methods of research and objectives are reviewed. A discussion of the Institute's policies regarding funding, means of contact, working relationships, and agreements made with governments, scientists and supporting organizations is presented. (Atkins-Omniplan)

A HISTORICAL PERSPECTIVE OF WATER MANAGEMENT IN NEW MEXICO,
New Mexico Interstate Stream Commission, Santa Fe.
S. E. Reynolds.
In: A Quarter Century of Water Research. Proceedings of the Twenty-Fifth Annual New Mexico Water Conference. Apr. 24-25, 1980. WRRI Report No 124, Aug. 1980. p 20-32. New Mexico Resources Research Institute, New Mexico State University, Box 3167 Las Cruces, NM 88003.

Descriptors: *New Mexico, *Water law, *Water resources, *Water management(Applied), *Judicial decisions, Water utilization, Competing uses, Diversion, Preferences, Non-riparian waters, Beneficial uses, Prior appropriation, Riparian rights, Federal project policy.

The last 25 years of water management in New Mexico have been shaped by significant court decisions and interpretations of the statutes: the statues are based on the appropriation doctrine rather than the riparian doctrine of water rights. Surface water codes were codified in 1907 and affirmed in the state construction of 1911. Ground water codes were applied in 1931. Twenty six other states have been influenced in their approach to water management. Sixty state supreme court decisions in the last 25 years attest to the activity. The statutes and decisions have shaped public use as well as economic enterprise, based on the principles of beneficial use weighing considerations of equity and the time of use for rights. The state engineer's every decision, act or refusal to act is subject to appeal to district court. In New Mexico a water right is a property right. State versus Federal controversy over instream flows is clear in New Mexico: there can be no instream water right. (Meade-Omniplan)
W81-00392

MINE DEWATERING,
M. B. Campbell.
In: A Quarter Century of Water Research. Proceedings of the Twenty-Fifth Annual New Mexico Water Conference. Apr. 24-25, 1980. WRRI Report No 124, Aug. 1980. p 175-180. New Mexico Resources Research Institute, New Mexico State University, Box 3167 Las Cruces, NM 88003.

Descriptors: *Mine water, *Water treatment, *Legal aspects, *Mining, *Mine Dewatering Act, *New Mexico, Surface water, Uranium, Mining, Equitable apportionment, Water appropriation, Ion-exchange, Mineral industry, Water permits, Legislation.

A mine dewatering controversy exists in New Mexico which focuses on the uranium industry. The extraction or discharge of water encountered in mineral production is necessary in several mining operations. Federal and state water quality standards require mining companies to clean water prior to discharging it at the surface. The New Mexico Department of Energy estimates that by the mid-1980's New Mexico will have 72 active uranium mines each discharging water in quantities of approximately 90 cu/ft/sec. The uranium industry's cleaning process is accomplished with an ion-exchange which allows uranium particles to drop out of the water, thus determining the water to be of beneficial use. Since no permit of appropriation was granted, as required by the state for the beneficial-use water, significant legal effects exist. In 1980, the Mine Dewatering Act was passed which subject mine dewatering companies to the jurisdiction of the State Engineer. They will also be given the right to replace the water of other water owners whose activity is imparied. Providing a plan of implementation is approved, the Mine Dewatering Act of New Mexico provides flexibility, prevents companies from dewatering for the entire lifetime of the mine and maintains traditional doctrines of appropriation. SHOULD I ARBITRATE OR LITIGATE.
P. J. Sullivan.
Water and Sewage Works, Vol 127, No 10, p 37, 59, October, 1980.

Descriptors: *Contracts, *Claims(Contracts), *Municipal water, Specifications, Legal aspects, Sewerage, Performance, Supply contracts, Design, Construction, Judicial decisions, Legal review.

Some contract disputes may be resolved by the parties attempting to find solutions rather than faults, avoiding, wherever possible, the intervention of lawyers, while some can be avoided by drawing up contracts and working agreements that leave little room for argument. A contract usually specifies sewer size and bedding type and contains other statements to the effect that the contractor must follow the owners' specifications. Some municipalities wrongly attempt to force the contractor to accept responsibility for all eventualities while at the same time retaining complete control. Courts generally frown upon clauses stating that the owner has a right to take the job away from a contractor if the latter does not perform as specified under certain circumstances. The author recommends a letter of credit rather than a bond as a guarantee that the contractor will perform as required. If a dispute brings about a law suit, it is then the bank that is sued. An unconditional letter of credit implies that the bank must not involve itself in a dispute, though the bank is entitled to pay the money to the owner or to pay the money to the court if the bank is sued. (Gish-FRC)

SHIPPING IN THE BALTIC,
Handelshogskolan i Stockholm (Sweden).
G. Alexandersson.
Ambio, Vol 9, No 3-4, p 158-162, 1980. 5 Fig, 11 Ref.

Descriptors: *Ships, *International commissions, *Recreation wastes, *Water pollution control, Harbors, Transportation, Ferry boats, Water pollution sources, Marinas, Boating, Waste water treatment, Commercial fishing, Baltic Sea, Oceans.

The effects of changing trends in shipping on water pollution control in the Baltic Sea are discussed. Since 1950, ships have increased in size, speed, and in level of specialization, yet have decreased in number. The Great Belt, a Danish transit route, has become the primary passageway from the North Sea to the Baltic, because its depth can accommodate modern ships. All shipping services have become automated. Passenger transport has declined, while ferry traffic has increased in conjunction with road traffic. In the Soviet Union, Baltic ports are favored over Black Sea ports for general cargo trade, and, within the Scandinavian countries, the number of dominant ports is declining. These trends reduce the number and simplify the building of port installations needed to comply with international agreements on the control of water pollution. Increases in water-oriented recreation may provide popular support for costly water quality measures, yet may create new shipping problems and new demands for Baltic water pollution control facilities. (Titus-FRC)

WATER-RELATED ENVIRONMENTAL FACTORS,
Inland Waters Directorate, Edmonton (Alberta).
R. J. Lane.
In: Proceedings of the Technology Transfer Workshop, Environmental Impact Assessment in the North, Oct 31, Nov 1-2, 1978. Inland Waters Directorate, Ottawa, Ontario, Canada, Technical Workshop Series No 1, p, 9, 101-106, 1979.

Descriptors: *Environmental impact assessment, *Arctic, *Northern development, *Environmental effects, Planning, Water quality, Water pollution, Administration, Water supply, Flow, Rivers, Sediment transport, Canada.

Costly, accelerated response by government to northern developmental assessment is still evolving, but it is clear that IWD has responsibilities in the process to provide advice to an initiator's development of an initial environmental evaluation (IEE), to provide staff to serve on environmental assessment panels, to assist in the preparation of guidelines for invironmental impact statements (EIS), and to evaluate EIS reports. No IWD studies are needed except when paid for by an initiator or when IWD is incapable or providing sound advice. For water quantity, federal interests are interprovincial flows or international commitments, the latter including factors relating to waterfowl and climate. A change in flow trend because of development could also create an inventory concern. Concerns related to sister agencies in the north are flood demaged, changes in navigable waters and threatened waterfowl or fish habitat. Pertinent water quality concerns are in interprovincial or international waters. In addition, contaminantion by toxic substances requires problem definition, as well as parameter sampling and predictive model evaluation. Other quality concerns are radioactivity, eutrophication, oil spills and waste heat disposal. Additional network development for impact assessment should be minimal and preferably cost-shared with provincial or territorial governments. (WATDOC)

THE ARTIC ISLANDS PIPELINE PROJET: ITS GOALS, OBJECTIVES AND PROGRAM DEVELOPMENT FOR FRESHWATER PROJECT NO. 1,
Inland Waters Directorate, Winnipeg (Manitoba).
J. E. Slater.
In: Proceedings of the Technology Transfer Workshkop, Environmental Impact Assessment in the North, Oct 31, Nov 1-2, 1978. Inland Waters Directorate, Ottawa, Ontario, Canada, Technical Workshop Series No 1, p 7-8, 97, 1979,

Descriptors: Geomorphology, Hydrologic properties, Keewatin district, Spence Bay, Canada.

The terms of reference supplied to the study group were to examine the effects of a buried gas pipeline on river crossings. Because of provincial jurisdiction, study was confined to regions north of 60 degrees latitude. The principal constraints on the study were time and money. The time period of 2-3 years made available was insufficient to obtain data for hydrologic and geomorphic parameters in the usual way which normally relies on statistical analysis for sampling periods in excess of 10 years. The absence of any hydrologic network north from the Keewatin district (one station on Cornwallis Island) made data transfer techniques untenable. However, it was possible to provide a qualitative description of river features based on map studies, airphoto analysis, and spot sampling of pertinent parameters at 27 selected river sites visited on two reconnaissance surveys, sampling information, later assembled in a stream catalogue, described streamflow, sediment concentration, bed and bank material, ground-ice conditions, floodplain characteristics, river slope and valley-wall approaches. Aside from their value the data assisted researchers in associated disciplines. Not very much hard data resulted from these stuidies, but examination of fluvio-morphologic processes active in the barrenland permafrost regions permitted the tentative definition of some areas thought to be environmentally sensitive to pipeline activity. 7. RESOURCES DATA

7A. Network Design

MICROBIOLOGICAL WATER AND EFFLUENT SAMPLE PRESERVATION,
Canada Centre for Inland Waters, Burlington (Ontario).
B. J. Dukta, and A. El-Shaarawi.
Canadian Journal of Microbiology, Vol 26, No 8, p 921-929, August, 1980. 6 Tab, 8 Ref.

Descriptors: *Water sampling, *Water storage, *Water temperature, *Aquatic bacteria, *Bioassay, Coliforms, Streptococcus, Sewage bacteria, Analytical techniques, Membrane processes, Municipal wastes, Domestic wastes, Industrial wastes, Pulp wastes, Streams.

The effect of storage temperature on four water samples (relatively pure stream water, water containing municipal sewage, a canal containing industrial wastes including pulp and paper effluents, and the unchlorinated effluent from a sewage treatment plant) was studied to ascertain whether the period between sample collection and sample analysis could be extended without significantly affecting bacterial populations. Bacteria tested were total coliform (TC), fecal coliform (FC), fecal streptococcus (FS), and heterotrophic bacteria (HB). Each water sample was cooled immediately after collection to approximately 1.5 C by storage in crushed ice. After 2, 24, 30, and 48 hours, the sample was homogeneously mixed, and a subsample was tested. Analysis of variance was performed on the replicated data and on the entire data set. The results indicated that original water temperature does not seem to be a consistent factor in the preservation of microbiological water samples; over 75% of samples tested for TC, FC, and FS were microbiologically stable for at least 24 hr in melting-ice conditions. At least 42% of samples were stable for 48 hours. HB density was the least stable, with at least 30% and 50% of analyses being stable at 48 and for at least 24 hours, respectively. The results demonstrate that natural water samples to be tested for TC, FC, FS, and HB can be preserved for 24 hours without significantly changing microbiological characteristics. (Gish-FRC)

MORPHOMETRIC AND HYDRAULIC DATA COLLECTION PROGRAMS,
Water Survey of Canada, Ottawa (Ontario).
J. G. Way.
In: Proceedings of the Technology Workshop, Environmental Impact Assessment in the North, Oct 31, Nov 1-2, 1978. Inland Waters Directorate, Ottawa, Ontario, Canada, Technical Workshop Series No 1, p 13, 123-124, 1979.

Descriptors: *Environmental impact assessment, *Arctic, *Northern development, *Environmental effects, Data collections, Hydrologic properties, Hydraulic properties, Maps, Sampling, Photo analysis, Measurement, Arctic islands, Pipelines, On-site data collections, Canada.

This talk describes data assembly techniques used in the Arctic Island Pipeline Program. Site selection was by map and airphoto analysis, as was the assembly of data on chosen sites for stream order, hypsometric coefficients, integrals, basin area, river length, basin perimeter length and width. In the field, samples were obtained of suspended sediment, bed material, streamflow, water quality and thaw depth. Qualitative assessemtn of surrounding terrain was made on prepared forms. Hydraulic channel properties were measured. Subsequent analysis suggested possible flood magnitudes for studied sites. To incorporate these procedures into regular programs requires staff training. SPECTROPHOTOMETRIC DETERMINATION OF TRACES OF COBALT IN WATER AFTER PRECONCENTRATION ON REAGENT-LOADED POLYURETHANE FOAMS,
Eotvos Lorand Univ., Budapest (Hungary). Inst. of Inorganic and Analytical Chemistry.
T. Braun, and M. N. Abbas.
Analytica Chimica Acta, Vol 119, No 1, p 113-119, September 1, 1980. 1 Fig, 5 Tab, 23 Ref.

Descriptors: *Water analysis, *Cobalt, *Trace elements, *Spectrophotometry, *Foam fractionation, Separation techniques, Analytical techniques, Filtration, Absorption, Testing.

A simple, inexpensive and rapid method for the preconcentration of traces of cobalt from large volumes of water on reagent-loaded polyurethane foam columns prior to spectrophotometric determination of the cobalt is described. Open-cell polyurethane foam loaded with 1-(2-pyridylazo)-2-naphthol (PAN) was used to concentrate cobalt from a parts per billion level in water with a concentration factor of 1000 or more. Cobalt was retained quantitatively from thiocyanate solution on the loaded foam placed in a column and recovered completely from the foam by elution with acetone. Spectrophotometric determination of cobalt was carried out with 4-(2-pyridylazo)-resorcinol at 510 nm after interfering ions were removed with a Dowex 1-X8 column. The results for the determination of 1.0 micrograms of cobalt in the presence of 10.0 micrograms of nickel and 20.0 micrograms of iron before and after the Dowex column separation indicated good recovery rates for cobalt with column separation. A SIMPLIFIED AUTOMATED CHELOMETRIC METHOD FOR THE DETERMINATION OF SULFATE IN INTERSTITIAL WATER AND SEAWATER,
Quebec Univ., Rimouski. Dept. of Oceanography.
J. Lebel, and N. Belzile.
Marine Chemistry, Vol 9, No 4, p 237-241, August, 1980. 1 Fig, 3 Tab, 7 Ref.

Descriptors: *Chelation, *Connate water, *Automation, *Sulfates, *Chemical precipitation, Sea water, Volumetric analysis, Electrodes, Analytical techniques, Chemical analysis.

A method is described whereby sulfate can be determined in interstitial water and in seawater. The method calls for the precipitation of barium sulfate. Excess barium is then titrated with ethylenediaminetetraacetic acid using an amalgated silver electrode for end-point detection. This determination is as accurate as the classical gravimetric method used and is valuable due to the simplicity and small sample requirements. The value of using small samples becomes particularly clear when analyzing interstitial water samples. An accuracy of better than 0.5% is obtained with this method. (Baker-FRC)

A REMOTE MONITORING SYSTEM FOR WATER QUALITY PARAMETERS,
Army Engineer Waterways Experiment Station, Vicksburg, MS.
E. D. Hart, and B. W. McCleave.
In: Proceedings, 14th Annual Mississippi Water Resources Conference, 24-25, September 1979. p 89-90, (1979) 3 Fig.

Descriptors: *Remote sensing, *Monitoring, *Waves(Water), Data processing, Data collecting, Computer programs, Algorithms, Equipment, Measurement, Parametric hydrology, *Water quality, Microprocessors, Electronic equipment, Data transmission.

A remote wave monitoring system has been developed to study wave action, a major contribution to streambank damage. The system uses a microprocessor with state-of-the-art low-power components. It functions unattended, uses less than 10 watts of power, and the batteries may be charged by solar cells. A Texas Instrument 733 cassette tape with a low-power Memodyne recorder is used to store 35 days worth of data. Data can be printed on any Silent 733 terminal or transmitted over telephone lines. Time of day is recorded for synchronization and comparison. The hardware utilizes two printed circuit boards, a commercially available board and a Waterways Experiment Station Input and Output board. There are several software utility packages to allow modular program development, Algorithms which fit the application are used for data processing. The best algorithm for wave height analysis is yet to be determined. At present the system is being laboratory tested. With debugging it will become a valuable tool that can be adapted to almost any water quality parameter. (See also W81-00290) (Seigler-IPA)

SURGE TANK WATER LEVEL VARIATIONS FOLLOWING RAPID VALVE OPENING,
University of Wales Inst. of Science and Technology, Cardiff. Dept. of Civil Engineering and Building Technology.
P. W. France.
Advances in Water Resources, Vol 3, No 1, p 41-43, March, 1980. 3 Fig, 8 Ref.

Descriptors: *Surge tanks, *Surges, *Mathematical models, *Water levels, Valves, Equations, Measurement, Instrumentation, Pipelines, Penstocks, Energy, Engineering structures, Flow, Water flow, Flow rates, Model studies, Hydraulic models.

Experimental values for maximum downsurge following rapid valve opening in a model surge tank were investigated over a range of flow rates employing a modified initial value technique. Movement of the water surface in the surge tank after valve opening may be calculated for any time after valve closure by an energy equation where the length and area of the supply tunnel and velocity through the tunnel are known. The basic equations may be reapproached in the finite difference form, where changes in tank levels may be determined. A desk top calculator linked to a graph plotter was programmed to give a visual display of the finite difference solutions. By applying a predictor-corrector technique, an average gradient over the time interval may be generated to yield closer approximation to the actual curve than the tangential straight lines obtained from the simple initial value method. Results indicated that, for this type of Perspex surge tank, a great deal of the water flowing in the penstock following rapid valve opening originates from the supply tunnel; this should therefore be considered in any calculations. MASS FRAGMENTOGRAPHIC DETERMINATION OF POLYMETHYLNAPHTHALENE AND POLYMETHYLPHENANTHRENE IN A CRUDE OIL AND IN MARINE ORGANISMS,
Hyogo Prefecture Public Health Inst., Kobe (Japan).
K. Adachi.
Bulletin of Environmental Contamination and Toxicology, Vol 25, No 3, p 416-423, September, 1980. 4 Fig, 2 Tab, 16 Ref.

Descriptors: *Oil, *Oysters, *Mass fragmentography, Marine animals, Chromatography, Analytical techniques, Gas chromatography, Mass spectrometry, Water pollution effects, Oil pollution, Organic compounds, Separation techniques.

An activated charcoal chromatographic separation procedure for polymethylnaphthalene (PMN) and polymethylphenanthrene (PMP) in crude oil and a mass fragmentographic method for the quantitative determination of trace levels of these compounds in marine organisms are described. Tissue samples were homogenized and then saponified for 3 hr followed by filtration and extraction with n-hexane. Extracts were subjected to Florisil column cleanup and the eluate was concentrated before undergoing activated charcoal column chromatographic separation. Each eluate from the charcoal column was analyzed by gas chromatography-mass spectrometry. Biogenic compounds and ambiguous pollutants interferred with gas chromatographic analysis of marine organisms exposed to petroleum contamination at levels as low as a few micrograms/g. The single ion detection attachment was used during mass fragmentographic analyses for PMN and PMP. Ranges of PMN and PMP products in 0.5 mg of a crude oil and 50 g of oyster tissue were found to be 0.008-0.423 micrograms and 0.025-2.077 micrograms, respectively. Tests to study the applicability of the technique as an identifier of petroleum contamination were conducted on tissues of oysters collected from the Seto Naikai coast. Mass fragmentograms of oyster tissue were very similar to those of grade-A crude oil. The technique works well for assessment of long-term effects on marine organisms and environmental samples exposed to chronic low-level discharges of petroleum. (Geiger-FRC)

PRIORITY POLLUTANT ANALYSES OF INDUSTRIAL WASTEWATERS USING A MICROEXTRACTION APPROACH,
Southwest Research Inst., San Antonio, TX. Dept. of Environmental Sciences.
J. W. Rhoades, and C. P. Nulton.
Journal of Environmental Science and Health (A), Vol 15, No 5, Special Issue, p 467-484, 1980. 1 Fig, 2 Tab, 9 Ref.

Descriptors: *Microextraction, *Pollutant identification, *Aromatic compounds, Gas chromatography, Organic wastes, Analytical techniques, Separation techniques, Water pollution sources, Chemical wastes, Plastics, Industrial wastes, Phenols, Waste water(Pollution), Laboratory tests.

A microextraction procedure for analyzing priority-pollutant volatile aromatics, phthalates, polynuclear aromatics, and phenols in waste water was tested on a variety of process waters and effluents from the plastics and organic chemistry industries by the EPA during verification analyses. The extraction was a one-step method in which the solvent: waste water ratio ranged from 1:40 to 1:100. Benzene, toluene, and ethylbenzene were extracted with pentane, and polynuclear aromatic hydrocarbons and phthalates were extracted with hexane. Waste water analyzed for phenols first underwent a base-neutral extraction using methylene chloride and diisopropyl ether. Gas chromatographic analysis was then performed. Comparisons of microextraction results with exhaustive extraction results showed that less variability in spike recoveries and in duplicate analyses occurred with the microextraction method. Data from the analysis for phenols indicated that exhaustive extraction did not necessarily lead to higher recoveries and that high extraction efficiencies (> 70%) were not essential for achieving reliable analyses. Single-step extraction allows the analyst to extract selectively the analyte of interest with relative ease. Microextraction also minimizes false positives, difficulties caused by emulsions, and the necessity for column cleanup. (Geiger-FRC)

EXPERIMENTAL APPLICATION OF GAS CHROMATOGRAPHIC HEADSPACE ANALYSIS TO PRIORITY POLLUTANTS,
Greenwood Lab., Kennett Square.

G. R. Umbreit, and R. L. Grob.
Journal of Environmental Science and Health (A), Vol 15, No 5, Special Issue, p 429-466, 1980. 2 Fig, 1 Tab, 45 Ref, 1 Append.

Descriptors: *Gas chromatography, *Organic wastes, *Pollutant identification, Volatility, Water pollution sources, Aromatic compounds, Storage, Headspace gas analysis, Analytical techniques, Laboratory tests, Chlorides, Sealants, Separation techniques.

The analysis of headspace gases is useful in determining volatile organics present as pollutants in water in which the aqueous phase is equilibrated with an inert gas phase, usually of equal volume. The gas phase of the contaminant is extracted by a gas and subsequently analyzed by gas chromatography. The theories and procedures for headspace gas analysis are reviewed. Pre-experiment tests using three separate samples containing vinyl chloride, methyl chloride, and ethyl chloride showed that distilled water caused an unknown interference, so tap water was used for the remainder of the analyses. Storage studies on these three volatile organics gave evidence that stability was sufficient for = or > 3 days. Samples containing vinyl chloride, methyl chloride, or ethyl chloride were sealed with Hycar or Teflon septums and analyzed at various intervals over the course of 16 days. No differences were found between the performance of the two types of seals, and both were found to maintain stability of the samples under conditions and in the time periods used. The total range of variation increased with increasing storage times. The present method has been applied to the determination of benzene, toluene, xylenes, and chlorobenzene at levels < or = 10 micrograms/liter and carbon tetrachloride, 1,1,1-trichloroethane, chloroform, bromoform, dichlorobromomethane, dibromochloromethane, trichloroethylene, and tetrachloroethylene at < or = 1 microgram/liter. (Geiger-FRC)
W81-00446

ESTIMATED APPLICATION OF GAS CHROMATOGRAPHIC HEADSPACE ANALYSIS TO PRIORITY POLLUTANTS,
Catalytic, Inc., Philadelphia, PA. Environmental Systems Div.
W. F. Cowen, and R. K. Baynes.
Journal of Environmental Science and Health (A), Vol 15, No 5, Special Issue, p 413-427, 1980. 4 Tab, 18 Ref.

Descriptors: *Gas chromatography, *Pollutant identification, *Water pollution sources, Organic wastes, Headspace gas analysis, Volatility, Aromatic compounds, Separation techniques, Laboratory tests, Analytical techniques.

The application of a gas chromatography headspace technique to the determination of EPA priority pollutants was examined. Preselected conditions for all estimates of headspace gas levels included a temperature of 25C, equal volumes of headspace gas and liquid phases, no significant ionic strength or salting out effects, a simple binary (pollutant-water) system, and an initial priority pollutant level of 5 micrograms/liter. Theoretical distribution coefficients were calculated from vapor pressure and aqueous solubility values found in the literature. Estimated headspace gas concentrations for 26 priority pollutants are compared to instrument detection limits obtained from flame ionization, electron capture detectors, and Hall electrolytic conductivity methods. Of the 33 purgeable priority pollutants estimated as amenable to headspace determination at an aqueous concentration of 5 micrograms/liter, only acrolein, acrylonitrile, 2-chloroethyl vinyl ether, and 1,3-dichloropropene remain questionable for this type of analysis. (Geiger-FRC)

APPROACH TO QUALITY ASSURANCE/QUALITY CONTROL IN THE ORGANIC CHEMICALS INDUSTRY MONITORING PROGRAM,
Environmental Protection Agency, Washington, DC. Effluent Guidelines Div.
P. W. Holtzclaw, and M. D. Neptune.
Journal of Environmental Science and Health (A), Vol 15, No 5, Special Issue, p 525-543, 1980.

Descriptors: *Industrial wastes, *Quality control, *Water quality standards, *Organic wastes, Testing procedures, Water pollution, Water analysis, Clean Water Act, Water pollution control, Legislation, Analytical techniques, Monitoring, Toxins.

In 1977, the Clean Water Act called for the development of guidelines to control specific toxic pollutants in industrial discharges. New analytical procedures have been formulated to meet this mandate, and quality assurance (QA) and quality control (QC) programs have been devised to provide data on the precision and accuracy of the analytical results. QA procedures encompass the total program which ensures the consistency and reliability of results. QC procedures are collective routine actions taken to provide QA in the laboratory. A QA/QC plan was designed for the Organic Chemicals Branch which had placed upon it a 2-wk period for method refinement and a rapid turnaround of samples during a 3-day sampling episode to simulate heavy workload conditions. Spiking and recovery studies were repeatedly employed to overcome the problems of variability in waste waters. The program was composed heavily of QA measures, but the quality of the generated data was known by the end of the study. Changes in the objectives or use of the data would necessitate changes in QA formats. Other programs may not require such QA measures, so before a QA/QC plan is initiated, available resources and projected use of data to be generated should be carefully considered. (Geiger-FRC)

AN EVALUATION OF FACTORS AFFECTING THE MICROEXTRACTION OF BENZENE, TOLUENE, ETHYLBENZENE AND O-XYLENE INTO PENTANE,
Little (Arthur D.), Inc., Cambridge, MA.
K. E. Thrun, K. E. Simmons, and J. E. Oberholtzer.
Journal of Environmental Science and Health (A), Vol 15, No 5, Special Issue, p 485-501, 1980. 6 Fig, 6 Tab, 2 Ref.

Descriptors: *Microextraction, *Solvent extractions, *Aromatic compounds, Evaluation, Volatility, Gas chromatography, Water pollution treatment, Analytical techniques, Pollutant identification, Water pollution sources, Separation techniques, Organic compounds, Laboratory tests.

Factors affecting the efficiency of a microextraction method to extract benzene, toluene, ethylbenzene, and o-xylene from water into pentane were examined. Quantitative analyses using microextractions are subject to loss of organic extracts through dissolution in the aqueous phase and volatilization. Also, since microextraction is usually done with a high sample:solvent ratio, compounds that do not partition readily into the organic phase will not be extracted as well. The present technique was designed to circumvent these problems. Two sample to solvent ratios (20:1 and 100:1) and various organic solvents were tested to see if comparable results could be obtained. The effects of salting out with sodium sulfate and the presence of other organics in the matrix were also studied. Samples were analyzed by gas chromatography with flame-ionization detection. Results of microextraction efficiencies were in good agreement with values estimated from published partition coefficients. Benzene was the least well extracted of the materials tested, though salting out with sodium sulfate significantly increased recoveries of this compound. Recoveries were generally lowered when the water-soluble organic acetonitrile was present, but this effect could be counteracted by saturation of the aqueous phase with sodium sulfate. Application of the microextraction technique to other priority pollutants seems to be limited by the partition coefficient. (Geiger-FRC)

CHARACTERISTICS OF GEL CHROMATOGRAPHY USING SEPHADEX GEL FOR FRACTIONATION OF SOLUBLE ORGANIC POLLUTANTS,
Yokohama National Univ. (Japan). Dept. of Safety and Environmental Engineering.
K. Urano, K. Katagiri, and K. Kawamoto.
Water Research, Vol 14, No 7, p 741-745, July, 1980. 9 Fig, 1 Tab, 8 Ref.

Descriptors: *Waste water treatment, *Chromatography, *Pollutant identification, Aromatic compounds, Spectrophotometry, Organic wastes, Gels, Analytical techniques, Separation techniques, Laboratory tests, Water pollution sources, Flow rates, Chemical properties.

Sephadex gel chromatography has recently become a feasible technique for the analysis of organic pollutants in waste water during treatment processes. Aqueous solutions kof 46 oranic compounds including organic polymers as well as low molecular weight compounds were chromatographed on Sephadex G-15 and G-25 columns. Eluted materials were measured by spectrophotometry for aromatic compounds and by total organic carbon analysis for non-aromatic compounds. The influence of water flow rate on the outcome of chromatograms and data reproducibility was studied on polyethyleneglycol (PEG)-1000, butyric acid, and phenol at flow rates of 0.2, 0.4, or 0.6 ml/min. Little difference (< 7%) was observed among peaks generated at different flow rates, so subsequent tests were run at a flow rate of 0.4 ml/min. Compounds having structures similar to PEG, sugars, and glycines displayed increased elution volumes as molecular weights decreased. However, this conventional relationship did not apply to many of the lower molecular weight compounds studied. In the case of aliphatic alcohols, aldehydes, carboxylic acids, sulfonic acids, ketones, and aromatic sulfonic acids, elution volumes increased with increasing molecular weights or carbon numbers. Results indicated that elution volume depended upon the chemical structure of the organic compound, because this determines the affinity of the molecule for Sephadex gel and water. (Geiger-FRC)

PARTICULAR SOLUTIONS TO THE PROBLEM OF HORIZONTAL FLOW OF WATER AND AIR THROUGH POROUS MEDIA NEAR A WETTING FRONT,
Cold Regions Research and Engineering Lab., Hanover, NH.
Y. Nakano.
Advances in Water Resources, Vol 3, No 2, p 81-85, June, 1980. 9 Ref.

Descriptors: *Unsaturated flow, *Fluid mechanics, *Air-water interfaces, *Mathematical studies, Thermodynamic behavior, Equations, Air circulation, Flow, Physics, Porous media, Darcys law.

Solutions are derived for the horizontal and simultaneous flow of water and air through homogeneous porous media near a wetting front. Two cases of the Cauchy problem of water movement are examined, the one-phase flow, in which movement of air is negligible or unrestricted, and the two-phase flow, where the effects of air flow on water flow are significant. Regularity properties are compared, and the effects of air flow on water flow are discussed. In one-phase flow problems, the wetting front, defined as the interface between dry and partially saturated parts of media, becomes an acceleration wave. The two-phase flow problem indicates that an interaction between water and air occurs near the wetting front. Singularity occurs in the solutions at the wetting front in both one- and two-phase problems. However, the one-phase flow solution only approximates the two-phase flow solution when saturation is minimal. The solutions support observations on various related initial

value problems which suggest that the system is in the intermediate asymptotic state and far from thermodynamic equilibrium. (Titus-FRC)

UNITED STATES GEOLOGICAL SURVEY YEARBOOK, FISCAL YEAR 1979.
Geological Survey, Reston, VA.
1980. 169 p.

Descriptors: *Reviews, *Annual, *Projects, *Data collections, *Natural resources, Water resources, Water quality, Energy, Mapping, Geological surveys, Landslides, Mineralogy, Land management, Indian reservations, Coals, Oil industry, Programs, Administration, Cost allocation, Budgeting, U.S. Geological Survey.

The fiscal year 1979 Yearbook summarizes the activities of the U.S Geological Survey in response to its scientific and regulatory missions and its responsibility for exploration of the National Petroleum Reserve in Alaska. The main sections of this Yearbook are: (1) The Year in Review--a brief overview of the significant events of the Geological Survey during fiscal year 1979; (2) Perspectives--essays focusing on specific events (rather than scientific topics) and programs involving multi-Division participation; (3) Missions, Organization, and Budget--a description of the Geological Survey's major duties and assignments and of the organizational structure that supports its missions; (4) Division Chapters--a description of the significant accomplishments (rather than a comprehensive program by program discussion) of each of the mine operating Divisions and offices; and (5) Appendices--provide supplementary information regarding key personnel, cooperators, and selected summary budgetary tables and an index. HYDROLOGIC AND LAND-COVER FEATURES OF THE CALOOSAHATCHEE RIVER BASIN, LAKE OKEECHOBEE TO FRANKLIN LOCK, FLORIDA,
Geological Survey, Tallahassee, FL. Water Resources Div.
H. H. LaRose, and B. F. McPherson.
Available from OFSS, USGS, Box 25425, Fed. Ctr., Denver, CO 80225, paper copy $3.50, microfiche $0.50. Geological Survey Open-File Report 80-732 (WRI), 1980. 1 Sheet, 2 Fig, 1 Tab, 5 Ref.

Descriptors: *Maps, *River basins, *Freshwater, *Surface waters, *Florida, Streamflow, Canals, Land use, Agriculture, Water quality, *Caloosahatchie River(Fl).

The freshwater part of the Caloosahatchee River basin, Fla., from Franklin Lock to Lake Okeechobee, is shown at a scale of 1 inch equals 1 mile on an aerial photomosaic, dated January 1979. The basin is divided into 16 subbasins, and the land cover and land use in each subbasin are given. The basin is predominantly rangeland and agricultural land. Surface-water flow in the basin is largely controlled. Some selected data on water quality are given. (USGS)

HYDROLOGIC DATA FROM UPPER GRANGE HALL CREEK BASIN, NORTHGLENN, ADAMS COUNTY, COLORADO,
Geological Survey, Lakewood, CO. Water Resources Div.
D. C. Hall, and A. C. Duncan.
Available from OFSS, USGS, Box 25425, Fed. Ctr., Denver, Co. 80225. Paper copy $17.75, microfiche $3.50. Geological Survey Open-File Report 80-578, 1980. 132 p, 2 Fig, 34 Tab, 10 Ref

Descriptors: *Hydrologic data, *Streamflow, *Surface runoff, *Watersheds(Basins), *Colorado, Groundwater resources, Rainfall, Snowmelt, Sediment transport, Water quality, Water analysis, Data collections, *Northglenn(CO), *Adams County(CO), *Grange Hall Creek(CO), *South Platte River basin(CO)

Hydrologic data collected during 1977-79 as part of a water-resources investigation of storm runoff in Upper Grange Hall Creek basin, Adams County, Colo., are presented in this report. Data presented in tabular form consist of: (1) Estimated daily precipitation at one site (April through October, 1978 and 1979); (2) mean daily streamflow at two sites (December 1977 through September 1979); (3) instantaneous streamflow at two sites along Grange Hall Creek and corresponding cumulative rainfall at one to three sites for 17 storms (April 1, 1978, to August 26, 1979); (4) concentrations of selected major ions, fecal-coliform bacteria, suspended sediment, nutrients, and trace elements at five sites during dry-weather flow, at three sites during rainfall runoff, and at five sites during snowmelt runoff; and (5) concentrations of pesticides and polychlorinated biphenyls at two sites during dry-weather flow and rainfall runoff. ECOLOGICAL IMPACT ASSESSMENT,
J. M. Baker.
Marine Environmental Research, Vol 3, No 4, p

245-248, September, 1980. 1 Fig, 3 Ref.

Descriptors: *Industries, *Ecology, *Data collections, *Effluents, On-site data collections, Toxicity, Water pollution, Chemical analysis, Path of pollutants, Sampling, Biology, Adaptation, Water pollution control, Pollutants.

Approaches to ecological impact assessment of industrial developments may be viewed as continuing processes, rather than as complete sets of predictions. One known method of evaluating the impact of industrial development takes into consideration everything in the system, while another consists of data gathering toward an end product which is little more than a literature search. The present approach differs from these two schemes in that ecological impact predictions are treated as hypotheses that must be tested by experimental techniques, and industrial development itself is regarded as a large field test, the outcome of which is not yet known. Monitoring for existing sites is essential in assessing ecological impact. Examples of objectives and monitoring approaches in this system are comparison of effluents with statutory chemical specifications (chemical analyses), information on toxicity of effluents at discharge point or water in receiving area (lethality tests), detection of changes in species combination and abundance (ecological surveys), and information on the movement, fate, and uptake by organisms of pollutants (chemical analyses of water, sediment, and tissue). Quantitative biological sampling from sites of chronic discharge has proven fruitful. Field experiments are an alternate method that has been of great use in the monitoring of oil spills. TENNESSEE-TOMBIGBEE WATERWAY: PLANNING HISTORY,
Army Engineer District, Mobile, AL.
F. L. Currie.
In: Proceedings, 14th Annual Mississippi Water Resources Conference, 24-25 September 1979. p 1-3, (1979).

Descriptors: *Tennessee-Tombigbee Waterway, *Tennessee River, *Tombigbee River, *Inland waterways, Canals, Canal design, Civil engineering, Locks, Navigation, Transportation, History, Project planning, Alabama.

An efficient waterway connecting the north-flowing Tennessee River with the south-flowing Tombigbee River to provide a continuous waterway from the Tennessee, Upper Mississippi, and Ohio Valleys to Mobile on the Gulf of Mexico is finally becoming a reality many years after it was first envisioned in the early 1700's. In 1819 Alabama had the project surveyed and in 1826 a company was chartered for the canal construction. The arrival of the railroad and right-of-way difficulties with the Cherokee Indians halted this attempt. In 1875 Congress authorized a survey of the project and a route was selected however, the report concluded that the route would only be usable during flood seasons. Following improvements on both rivers, another route was proposed by the Corps of Engineers in the early 1900's that would be usable year round but, due to excavation requirements this plan was also abandoned. In the 1930's the waterway idea once again was considered. In 1946 Congress authorized the Tennessee-Tombigbee Waterway but no funding was provided. The waterway was reevaluated in 1957 and in 1965. Finally in 1971 funds were appropriated for construction. (See also W81-00290) (Seigler-IPA)
W81-00291

TENNESSEE-TOMBIGBEE WATERWAY PROJECT DESIGN AND CONSTRUCTION ACTIVITY,
Army Engineer District, Mobile, AL.
F. G. Thompson.
In: Proceedings, 14th Annual Mississippi Water Resources Conference, 24-25 September 1979. p 5-7 (1979) 3 Fig.

Descriptors: *Tennessee-Tombigbee Waterway, *Inland waterways, *Tennessee River, *Tombigbee River, Project planning, Canals, Canal design, Civil engineering, Locks, Navigation, Transportation, Environmental effects, Dredging, Locks, Engineering structures.

After a long period of planning, design, and construction, the Tennessee-Tombigbee Waterway is now scheduled to open for navigation in mid-1984. The Waterway will provide a shortened route between shipping points in mid-America and the deepwater ports of the Gulf coast. It will connect the Tennessee River at Pickwick Lake with the Tombigbee River at Demopolis, a water level difference of 341 feet. The Waterway has three sections; the 148 mile River Section, the 44 mile Canal Section, and the 40 mile Divide Section. Major structures on the River Section include the Demopolis Lock and Dam, the Gainesville Lock and Dam, the Aliceville Lock and Dam, the Columbus Lock and Dam, and the Aberdeen Lock and Dam. For the Canal Section a channel will be excavated east of the Tombigbee River leaving the river in an essentially natural state. The Canal Section will have five locks for a total lift of 140 feet. The Divide Section cut will require the excavation of 149,700,000 cubic yards of material at a cost of $270,601,206. The Corp of Engineers is placing much emphasis on environmental considerations and inspections are being conducted annually. Actual construction is now about 35% complete. W81-00292

TENNESSEE-TOMBIGBEE WATERWAY: PROJECT OPERATION, CULTURAL AND RECREATION RESOURCES DEVELOPMENT,
Army Engineer District, Mobile, AL.
G. L. Melton, J. J. Nielsen, and E. Topper.
In: Proceedings, 14th Annual Mississippi Water Resources Conference, 24-25 September 1979. p 9-13 (1979) 5 Fig.

Descriptors: *Tennessee-Tombigbee Waterwsay, *Recreation facilities, *Archaeology, *Operation and maintenance, Canals, Project planning, History, Environmental effects, Inland waterways, Camping, Boating, Swimming, Lakes, Locks.

The cultural resources program for the Tennessee-Tombigbee Waterway is one of the most comprehensive programs of its type. Due to the number and variety of sites found the Tombigbee River Multi-Resource District was approved by the National Register in 1977. Human occupation of the area potentially dates back 12,000 years. It is estimated that sites, both prehistoric and historic, along the waterway probably number into the thousands. Redesign and avoidance procedures will be used to preserve as many sites as possible. Forty-nine recreation sites are planned for the 42,000 water surface acres of the project. Lakes associated with the project will have company areas, day use areas, and boat launching facilities. Two marinas will also be part of the initial recreational development. The initial recreation facilities will be operated and maintained by the Corps of Engineers. The area management office will be in Columbus, Mississippi, with three sub-offices located along the waterway. Due to limited Corps personnel operation and maintenance will be contracted to private enterprise. Descriptions and maps of individual lakes and recreation facilities are provided. (See also W81-00290) (Seigler-IPA)
W81-00293

MISSISSIPPI DAM SAFETY PROGRAM,
Mississippi Dept. of Natural Resources Jackson. Bureau of Land and Water Resources.
J. W. Pepper.
In: Proceedings, 14th Annual Mississippi Water Resources Conference, 24-25 September 1979. p 23-25 (1979).

Descriptors: *Mississippi, *Dam failure, *Flood damage, Dams, Dam design, Dam construction, Flood control, Overflow, Spillways, Maximum probable flood, Safety, Safety factors, Inspection, Aerial photography.

In recent years Mississippi has passed laws to locate and remove hazards caused by dams and to require written authorization for future dams with drainage areas of fifty or more acres. There are as many as 125,000 livestock ponds in the State that were built prior to controls. Following the failure of dams such as the Teton Dam in Idaho in 1976 and the Toccoa Falls Dam in Georgia, $15 million was made available for dam inspection. In 1975 high altitude photographs were used to make an inventory of dams capable of storing 50 acre feet or more of water. Dams located where, if they failed, 'more than a few' lives would be endangered were placed in Category I. Seventy dams received this classification although later deletions and additions were made. Upon inspection, dams were considered unsafe if their spillway would not pass 50% of the Probable Maximum Flood without overtopping the dam. The major problems found were inadequate spillways and some dams designed by bulldozer operators had structural problems. Seepage and stability problems were also common. Cooperation from dam owners in making their dams safer was excellent. All unsafe dams have had some work to remedy their problems and much has been done to correct the lack of maintenance. (See also W81-00290) (Seigler-IPA)

PROCESS AND APPARATUS FOR MAINTAINING A DESIRED DEPTH OF A WATERWAY,
C. B. Pekor.
U.S. Patent No 4,189,253, 6 p, 10 Fig, 7 Ref; Official Gazette of the United States Patent Office, Vol 991, No 3, p 949, February 19, 1980.

Descriptors: *Patents, *Sedimentation, *Channels, Sediment transport, Suspension, Flow control, Channel improvement, Pumps, Jets, Equipment, Channel morphology, Depth, Channel maintenance, Waterways.

A process and apparatus maintains a waterway at a desired depth, the bottom of which is subject to accumulation of sediment such as sand. The process comprises the placement of jet pumps on a vertically movable support together with the step of fluidizing the sediment immediately beneath the pumps so that they sink by gravity at least to the desired depth of the waterway. The process further comprises supplying injection water to the sediment covered pumps and removing the sediment-water slurry from the pump. A support member spans the width of the waterway being mounted for vertical movement relative to the bottom of the waterway. Jet pumps are mounted on the support member so that the entire array may be lowered at least to the desired depth of the waterway. Additionally, the structure on which the pumps are mounted may carry a conduit to which water under pressure is directed to fluidize the bottom, permitting the pumps to be lowered or raised. (Sinha-OEIS)

RANDOM HYDRODYNAMIC FORCE ON DAM FROM EARTHQUAKES,
Delaware Univ., Newark. Dept. of Civil Engineering.
C. Y. Yang, and V. Chiarito.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-124166, Price codes: A02 in paper copy, A01 in microfiche. Technical Research Report (1980), 22p, 4 Fig, 5 Tab, 13 Ref. OWRT-A-047-DEL(2), 14-34-0001-0108.

Descriptors: *Dams, *Earthquakes, Hydrodynamics, Forces, Random process, *Dam design, *Gravity dams, Hydraulic structures, Model studies.

A new solution for the hydrodynamic force on gravity dams during earthquakes has been obtained. The horizontal acceleration of earthquakes is modelled by a time-dependent random process and the force response solution is given in terms of non-stationary power spectral density and the mean square function.

SEISMIC RISK ANALYSIS OF WILMINGTON, DELAWARE,
Delaware Univ., Newark. Dept. of Civil Engineering.
C. Y. Yang, and P. Dressel.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-124166, Price codes: A03 in paper copy, A01 in microfiche. Technical Research Report (1980), 34p, 11 Fig, 4 Tab, 13 Ref. OWRT-A-047-DEL(1), 14-34-0001-0108.

Descriptors: Seismic risk, *Dams, Strengthening dams, Safety analysis, *Earthquakes, *Seismic studies, *Structural engineering, Vibrations, *Concrete dams, Delaware, Wilmington area(DE).

A seismic risk analysis is carried out for Wilmington, Delaware where an old and deteriorating concrete dam is located. The result confirms the prediction by the U.S. Geological Survey showing a risk of about 10% in 50 years for the occurrance of an earthquake ground acceleration of 0.04g. Extensions of predictions provide information for safety planning and strengthening of this dam.

WE INSTALL OUR OWN WATER MAINS,
Valparaiso Dept. of Waterworks, IN.
P. A. Coote.
American City and County, Vol 95, No 7, p 61-63, July, 1980. 2 Fig.

Descriptors: *Conduits, *Costs, *Contracts, Construction equipment, Economic planning, Municipal water, Water management(Applied), Administration, Installation costs, Construction costs, Legal aspects, Contract administration.

Details of the contract which Valparaiso's Department of Waterworks draws up with contractors for the installation of water mains are discussed. Added onto labor costs are the rental costs of excavators, other rental equipment, pressure testing, administrative costs, and 10% profit for the department. A typical job with a footage of 1,210 ft requires 106 hr and has an estimated cost of $3.70/ft. Actual costs has been $2.60/ft. Factors that led to the decision for the Department to do their own construction included departmental control over the pipe and fitting installation, the fact that crews had a thorough knowledge of the system, and the ability to maintain qualified personnel on the job. (McKeon-FRC)
W81-00433

8B. Hydraulics

INVESTIGATION OF A SURFACE RESISTIVITY TECHNIQUE FOR THE ESTIMATION OF HYDRAULIC CONDUCTIVITY IN STRATIFIED DRIFT AQUIFERS,
Connecticut Univ., Storrs. Dept. of Geology and Geophysics.
D. Scott.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-120594, Price codes: A06 in paper copy, A01 in microfiche. M.S. Thesis, 1980. 98 p, 17 Fig, 1 Tab, 73 Ref. OWRT-A-077-CONN(s), 14-34-0001-7014.

Descriptors: Surface resistivity technique, *New England, *Hydraulic conductivity, *Aquifers, Stratigraphy, Sands, Gravels, Water wells, Test wells, Model studies, Least squares method, Groundwater movement.

A least squares regression line correlating hydraulic conductivity with apparent formation factor of aquifers in sand and gravel (generally thought to be stratified drift in the cases discussed) is presented. Nineteen aquifers in southern New England were studied. Schlumberger vertical electrical soundings (VES) were conducted at water well sites for which pump test data were available. VES curves were automatically inverted and a value of aquifer resistivity was determined from the total longitudinal conductance of the resulting earth model. Methods for the interpretation of pump test data from water table and leaky artesian aquifers are discussed. The ratio of vertical to horizontal hydraulic conductivity averaged one to twenty-seven in the aquifers studied.

REAERATION TESTS, ENID LAKE OUTLET WORKS,
Army Engineer Waterways Experiment Station, Vicksburg, MS.
C. H. Tate.
In: Proceedings, 14th Annual Mississippi Water Resources Conference, 24-25, September 1979. p 91-95, (1979) 3 Fig, 1 Append.

Descriptors: *Oxygenation, *Water properties, *Aeration, *Radioactive tracers, Spillways, Liquid scintillation counters, Gases, Mississippi, Reservoirs, Water quality, Water chemistry, Chemical analysis, Sampling, Water analysis, Mississippi, *Enid Lake(MS).

The radioactive gas tracer technique developed by Dr. E. C. Tsivoglou was used to measure the gas transfer characteristics at the outlet structure of Enid Lake on the Yocona River in northern Mississippi. The lake has an earth fill dam 8,400 ft long and 293 ft high. Two eleven ft-diameter concrete conduits pass water through the base of the dam to the concrete paved spillway. For testing the stream was dosed upstream with three tracing elements. Krypton-85, a radioactive tracer, measures gas transfer between the water and the atmosphere. Tritium, also rdioactive, was used to measure the dispersion of the dose in the water. Rhodamine-wt dye indicated the presence of the radioactive trcers at the sampling stations. Samples were analyzed for radioactive concentrations using a liquid scintillation counter. The four sampling stations used were located at the emergency gate slot, the outlet portal, the entrance to the tailwater, and over the sill. Due to equipment problems only six of the planned eight doses were released. Results from the six released show that tracer samples can be collected at hydraulic structures and small changes in gas transfer can be detected. Data summaries are presented in an appendix. (See also W81-00290) (Seigler-IPA)

CHANNEL AND DYNAMIC FLOW CHARACTERISTICS OF THE CHATTAHOOCHEE RIVER, BUFORD DAM TO GEORGIA HIGHWAY 141,
Geological Survey, Doraville, GA. Water Resources Div.
R. E. Faye, and R. N. Cherry.
Available from Supt. of Documents, GPO, Washington, DC 20402, Price, $3.25. Geological Survey Water-Supply Paper 2063, 1980. 66 p, 22 Fig, 13 Tab, 11 Ref.

Descriptors: *Open channel flow, *Unsteady flow, *Flow characteristics, *Georgia, *Model studies, Mathematical models, Numerical analysis, Stage-discharge relations, Streamflow, Discharge(Water), Hydraulics, Mannings equation, Roughness(Hydraulic), Equations, Digital computers, Energy gradient, Cross-section, Hysteresis, *Chattahoochee River(GA).

Detailed flow and cross-section data for a 17-mile reach of the Chattahoochee River in northeast Georgia are described and summarized. Flow data include measurements of highly dynamic stage and discharge at five stations during the period March 21-23, 1976. Flow data were collected at 5-minute intervals and are listed accordingly. Coordinate data for 39 cross sections in the study reach are also listed. A mathematical model is developed and applied whereby stage data collected at a single station can be used to compute highly dynamic discharge at the station. The model is based on the continuity and momentum equations that described unsteady, one-dimensional flow in open channels. Both equations are transformed to a single quadratic equation which describes mean flow velocity at a single station. Flow-geometry parameters used by the model are computed using cross-section coordinates and the equation which describes the area of an irregular polyon. Use of the model in conjunction with highly dynamic stage data collected on March 23, 1976, provided close agreement between measured and computed discharges. The model was also used to investigate the sensitivity of highly dynamic discharge to channel and flow parameters. Computed dicharge was mot sensitive to changes in channel roughness and slope. ASPECTS OF RIVER MORPHOLOGY,
Inland Waters Directorate, Winnipeg (Manitoba).
R. W. Newbury.
In: Proceedings of the Technology Transfer Workshop, Environmental Impact Assessment in the North, Oct 31, Nov 1-2, 1978. Inland Waters p, 12, 1979. Directorate, Ottawa, Ontario, Canada, Technical Workshop Seris No.

Descriptors: *Rivers, *Channel morphology, *Environmental effects, *Manitoba, Churchill River, Nelson River, Southern Indian Lake, Water levels, River flow, River systems, Drainage, Watershed management, Canada.

Central to the writer's view of river morphology is a concept of fitness - a concept most difficult to describe since it cannot be defined precisely, but is still based in science. Fitness in natural system describes how one system fits with others, how well it blends into a unified whole. Environmental impacts are deviations from this natural fit. Development of drainage networks, which are analogous to other natural network such as those of trees and blood vessels. The ratios of branch order and branch length remain constant regardless of basin size. A second concept of fitness examines the vertical distribution in a river system and addresses a concept of stream power. It states that equal segments of river channel in unconsolidated materials generate equal amount s of power. IN typical, upwardly concave profiles, the headwater segments have greater head but less water than lower segments. Natural river systems will work towards the re-establishment of this equilibrium when man introduces changes in the regime. Two examples of misfit systems in Northern Manitobs are the diversion of Churchill River into a headwater on the Nelson River, and the raising of southern Indian Lake water levels. In a geologic time-frame, these perturbations are of no consequence, but in the short run of 50 to 100 years, a normal planning horizon for larger-scale development, they creat rather severe environmenment impact. 8I. Fisheries Engineering

NIGHTLY AERATION TO INCREASE PRODUCTION OF CHANNEL CATFISH,
Auburn Univ., AL. Dept. of Fisheries and Allied Aquacultures.
W. D. Hollerman, and C. E. Boyd.
Transactions of the American Fisheries Society,

Vol 109, p 446-452, 1980. 5 Fig, 5 Tab, 16 Ref. OWRT B-076-ALA(6), 14-34-0001-9101.

Descriptors: *Channel catfish, *Aeration, Dissolved oxygen, *Fish management, Ponds, Fish behavior, Unaerated ponds, Aerated ponds, Fish, Growth rates.

Channel catfish (Ictalurus punctatus) were stocked in 0.02- and 0.04-hectare ponds at 20,385 fish per hectare and fed daily. Fish averaged 11 cm total length and 6.2 g at stocking. Six ponds received nightly aeration (2 to 6 hours) and six ponds received no aeration. A maximum feeding rate of 90 kg/hectare was reached in October. In aerated ponds, no dissolved oxygen (DO) problems occurred, and survival was 92%. Fish mortalities resulted from DO depletion in all unaerated ponds, and survival was 40%. Nitrite-nitrogen concentrations were significantly higher in the aerated ponds, though never at levels reported as lethal to channel catfish. Concentrations of un-ionized ammonia were high enough in both aerated and unaerated ponds to have adversely affected growth. Aerated ponds yielded an average of 5,307 kg/hectare of channel catfish and had a net economic gain of $1,500 per hectare. The unaerated ponds yielded an average of 1,400 kg/hectare and were an obvious economic failure. Direct extrapolation of economic data to large commercial ponds is not advised.

WATER RESOURCES IN NORTH CAROLINA,
North Carolina Water Resources Research Inst., Raleigh.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-127318, Price codes: A04 in paper copy, A01 in microfiche. Annual Report, No UNC-WRRI-80-00, 1980. 68 p, 31 Fig. OWRT-A-999-NC(53).

Descriptors: *North Carolina, *Research priorities, *Chowan River, Eutrophication, Grants, Planning, Water resources, Water conservation, Agriculture, Research and Development, Information exchange, Projects, Reservoirs, Pulpmills, Waste water treatment.

The Institute supported 35 research projects during the year covering topics such as algal blooms on the Chowan River, the effects of large-scale agricultural development, the quality of the planned B. Everett Jordan Reservoir, water conservation, and wetlands protection. The nuisance blooms on the Chowan are one of the State's most serious and baffling environmental problems. The Chowan has too many nutrients from many sources. The Institute identifies needs, motivates and supports research, and promotes technology transfer. Water resources planning is another major concern of the Institute. New projects recently begun include: the hydrologic impacts of peat mining, treatment of pulp mill waste water, hydrologic and water quality models for in stream flow needs, and paper mill discharge effects on the Neuse. Institute 'mini-grants' funded last year included: appropriation technology and rural water and sanitation needs in the developing countries, groundwater quality at Greensboro's White Street landfill, and the potential for aquiculture in North Carolina. A listing of Institute reports and authors is included. (Seigler-IPA)

WATER RESOURCES RESEARCH PLAN FOR OREGON FOR THE PERIOD 1982-1987,
Oregon State Univ., Corvallis. Water Resources Research Inst.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-122103, Price codes: A06 in paper copy, A01 in microfiche. Report prepared for Office of Water Research and Technology, October 31, 1980. 112 p, 12 Fig, 2 Tab, 21 Ref.

Descriptors: *Oregon, *Research priorities, *Irrigation water, Water allocation(Policy), Water law, Runoff, Water shortages, Water reuse, Budgeting, Planning, Estuaries, Columbia River, Forests, Watersheds(Basins), Consumptive use, *Five-year plans.

Oregon's major water-related problems involve seasonal, geographic, and year-to-year maldistribution between water supply and competing water uses with recurring water shortage and excessive runoff. The State's largest consumptive use will always be for irrigation but other problem areas include river water quality; lake and reservoir water quality; bays, estuaries, and wetlands; planning and management of water resources; and forested watershed management. Four major categories will be used to classify these problems for research purposes: (1) water use, (2) groundwater, (3) bays, estuaries, and wetlands, and (4) general. Under water use, priority research areas will cover water rights transfers; Columbia River water use; agricultural, municipal, and industrial reuse; and water pricing policies. General problems research will be used to evaluate irrigation systems and application methods and to analyze recent changes in Oregon's water laws and institutions. A listing of problem areas and related studies by Federal and State agencies include priority, agencies participating, scheduling, and funding. Budget information is given by research problem for the years between 1982 and 1987 on two schemes, a $115,000 annual funding and a $135,000 annual funding from the Office of Water Research and Technology. (Seigler-IPA)
W81-00284

FIVE-YEAR WATER RESOURCES RESEARCH AND DEVELOPMENT GOALS AND OBJECTIVES,
South Dakota State University, Brookings. Water Resources Inst.
J. L. Wiersma.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-122061, Price codes: A05 in paper copy, A01 in microfiche. October, 1980. 94 p, 11 Fig, 8 Tab, 26 Ref.

Descriptors: *Research priorities, *South Dakota, *Research and development, *Precipitation(Atmospheric), *Agriculture, *Water resources development, Planning, Project planning, State jurisdiction, Erosion, Runoff, Rainfall intensity, Rain, Dams, Water conservation, Water use, Water quality, Wetlands, State governments, Water rights, Interstate rivers, Missouri River, *Five-year plans.

The five-year program was developed from a review of South Dakota water resources activities and issues. Water problems were concluded to revolve basically about a nonuniform and deficient annual precipitation, capable of producing storms of unusual intensity, for this principally agricultural State. Agriculture controls the basic research needs, requiring dependence on a judicious use and conservation of water resources. Potential water use exceeds that received by precipitation. Runoff-erosion processes that transport contaminants to surface water represent an additional concern. Since a documented State water plan has been lacking, the development of a base by researchers for proper decision-making was deemed important. The principal problems requiring research and resolution relate to sporatic and insufficient rainfall; transportation needs for available fresh water in Missouri River dams; and water use rights. The five-year plan has detailed proposed activities related to seven State water problem categories: (1) water quantity management; (2) conservation and efficient use; (3) water quality; (4) legal/institution/social/economic problems; (5) supply; (6) water-energy relationships; and (7) wetlands. Nineteen primary, nine secondary, and six tertiary priorities were identified for these categories, with water supply having the highest number (five) of primary priorities. Research approaches were formulated for the identified priorities. (Zielinski-IPA)

FIVE-YEAR WATER RESOURCES RESEARCH AND DEVELOPMENT PLAN: FISCAL YEARS 1982-1986,
Mississippi State Univ., Mississippi State. Water Resources Research Inst.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-126518, Price codes: A07 in paper copy, A01 in microfiche. Report submitted to Office of Water Research and Technology, 1980. 133 p, 6 Fig, 9 Tab, 66 Ref, 2 Append. 14-34-0001-0126.

Descriptors: *Research priorities, *Mississippi, *Water resources development, *Planning, *Water resources institute, Organizations, Water sources, State jurisdiction, State governments, Water supply, Research and development, Runoff, Storm runoff, Mississippi River, River basins, Floods, Water reuse, Streams, Droughts, Erosion, Wetlands, *Five-year plans.

The Mississippi Water Resources Research Institute has established a documented list of Mississippi water resources and related land-use problems, which has allowed for the development of prioritized research agenda and the identification of training and technology transfer activities to meet water resources needs. Current related activities by other agencies and organizations were identified and incorporated in the five-year research program. Identified problems include increased water demands causing geographically critical shortages annually; water quality impact on community surface waters by inadequate waste water treatment capacities and stormwater runoff; river basin flooding and erosion/sedimentation; and interstate and industry/municipality/agriculture intrastate conflicts over water use. The eight identified program elements covering on-going/proposed activities addressing these problem areas were: water conservation and reuse; water resources planning and management; maintenance of flows for stream uses; energy development impacts; water requirements for food and fiber production; flood and drought damage; wetlands protection; and water quality protection. (Zielinski-IPA)

Ecological Impact Assessment,
W81-00416 7C

ELECTRIC POWERPLANTS
Scale Reduction in Physical Hydraulic Models of Thermal Discharges,
W81-00327 5G

EMBANKMENTS
Stratified Bidirectional Seepage Flow Through an Earthen Embankment,
W81-00270 2H

EMBRYONIC GROWTH STAGE
Toxicity of a Fuel Oil to the Eggs of Parhyale Hawaiensis and Amphithoe Valida (Amphipoda),
W81-00440 5C

ENERGY
Sludge Treatment Vs. Energy Conservation,
W81-00439 5E

ENERGY DEVELOPMENT
The Impact of Energy Development on Water Resources,
W81-00397 3E

ENID LAKE (MS)
Reaeration Tests, Enid Lake Outlet Works,
W81-00308 8B

ENVIRONMENTAL EFFECTS
A Field Test of Environmental Impact Assessment in the Tensas Basin,
W81-00297 6B

Water-Related Environmental Factors,
W81-00458 6E

Aspects of Drainage Basin Morphometry of Relevance to Arctic Hydrology,
W81-00459 2J

Aspects of River Morphology,
W81-00460 8B

Morphometric and Hydraulic Data Collection Programs,
W81-00461 7A

A Biologist's View on the Role of Water Chemistry in Environmental Assessment,
W81-00462 1A

Discussion on Snowmelt,
W81-00464 2C

ENVIRONMENTAL IMPACT ASSESSMENT
Water-Related Environmental Factors,
W81-00458 6E

Aspects of Drainage Basin Morphometry of Relevance to Arctic Hydrology,
W81-00459 2J

Morphometric and Hydraulic Data Collection Programs,
W81-00461 7A

A Biologist's View on the Role of Water Chemistry in Environmental Assessment,
W81-00462 1A

Discussion on Snowmelt,
W81-00464 2C

EQUATIONS
Flood Frequencies by the Kinematic Wave Model,
W81-00485 2E

EQUIPMENT
An Instrumented Lysimeter System for Monitoring Salt and Water Movement,
W81-00273 2G

EROSION
Some Applications of the Concept of Geomorphic Thresholds,
W81-00342 2J

Knickpoint Migration Due to Baselevel Lowering,
W81-00401 2J

EROSION CONTROL
Geologic and Geomorphic Aspects of Streambank Erosion in the Yazoo Hill Streams,
W81-00299 2J

ESTUARIES
Evaluation of Pentron D-90 Toxicity to Juvenile Estuarine Fish and Blue Crabs,
W81-00456 5C

EUTAH-MCSHAN AQUIFER (MS)
Potentiometric Map of the Eutaw-Mc Shan Aquifer in Northeastern Mississippi, September, October, and November 1978,
W81-00357 2F

EUTROFICATION
Hydrologic Budget for Eagle Lake Near Willmar, Minnesota,
W81-00365 2H

EUTROPHICATION
Variability in Microbiological Data from a Stratified Eutrophic Lake,
W81-00405 2H

Lake Weeds can be Controlled,
W81-00418 5C

Ammonium Input to the Sea Via Large Sewage Outfalls - Part 2: Effects of Ammonium on Growth and Photosynthesis of Southern California Phytoplankton Cultures,
W81-00427 5C

Physiological Adapatations in Response to Environmental Stress During an N2-Fixing Anabaena Bloom,
W81-00449 2H

EVALUATION
A Regional Evaluation of Off-Season Agricultural Use of Water and Energy Resources,
W81-00314 3F

EVAPOTRANSPIRATION
Importance of Crop Production Functions in Evaluating Consumptive use of Water,
W81-00393 3F

FARM PONDS
Performance and Effects of SCS Floodwater Retarding Structures in the 1979 Easter Floods,
W81-00302 4A

Identification and Confirmation of Atrazine in Pond Water,
W81-00412 5A

FARM WASTES
The Collection, Treatment, and Disposal of Farm Wastes,
W81-00251 5D

FARMS
Make Sewage a Valuable Commodity,
W81-00258 3D

FEDERAL GOVERNMENT
Time for a New Clean Water Program,
W81-00260 6E

FEEDING RATES
Effects of Prudhoe Bay Crude Oil Contamination on Sediment Working Rates of Abarenicola Pacifica,
W81-00441 5C

FERNS
The Water-Fern Salvinia Molesta in the Sepik River, Papua New Guinea,
W81-00431 5C

FILTERS
Water Filter Design: What to Look for in the Eighties,
W81-00422 5F

FILTRATION
Zero Discharge: It Wasn't a Costly Pipedream for One Waterworks,
W81-00257 5D

Old Water System Gets New Life,
W81-00261 5D

Water Filter Design: What to Look for in the Eighties,
W81-00422 5F

FINITE ELEMENT ANALYSIS
Application of Finite Element Method in River Network Hydraulics,
W81-00473 2E

FISH
Evaluation of Pentron D-90 Toxicity to Juvenile Estuarine Fish and Blue Crabs,
W81-00456 5C

FISH BEHAVIOR
Environmental Impact of a Nuclear Plant on Mississippi River Biota in an Ecological Recovery Zone Near Red Wing, Minnesota,
W81-00262 5C

FISH MANAGEMENT
Nightly Aeration to Increase Production of Channel Catfish,
W81-00268 8I

FISHKILL
Identification and Confirmation of Atrazine in Pond Water,
W81-00412 5A

FIVE-YEAR PLAN
Vermont Water Resources Research Center Five-Year Plan for Water Resources Research and Development,
W81-00283 6E

FIVE-YEAR PLANS
North Carolina's Five-Year Water Research Program for 1982-1987,
W81-00280 6E

A 1982-87 Research Program for the University of Illinois Water Resources Center,
W81-00281 6E

A Five-Year Plan for Water Resources Research in Arizona,
W81-00282 6E

Water Resources Research Plan for Oregon for the Period 1982-1987,
W81-00284 9D

FIVE-YEAR PLANS

Five-Year Water Resources Research Program, W81-00285 6E

Five-Year Water Resources Research and Development Goals and Objectives, W81-00286 6E

A Five-Year Plan for Water Resources Research for Texas, W81-00287 6E

Five-Year Water Resources Research and Development Goals and Objectives, W81-00288 9D

Five-Year Water Resources Research and Development Plan: Fiscal Years 1982-1986, W81-00289 9D

A Five-Year Plan for Water Resources Research and Associated Technology Transfer Needs, W81-00330 6E

Water Resources Research Five-Year Plan/ 1982-1987, W81-00331 6E

Five Year Research Plan, 1982-1987, W81-00332 6E

Five-Year Water Research and Development Plan for Guam and Micronesia FY 82 Through FY 86, W81-00333 6E

Five Year Research and Development Plan for the Rhode Island Water Resources Center, W81-00334 6E

Five-Year Plan for the Louisiana Water Resources Research Institute, 1980-85, W81-00335 6E

Five-Year Plan of the Puerto Rico Water Resources Research Institute, W81-00336 6E

Nebraska Water Resources Center Five-Year Water Resources Research Program, 1982-1987, W81-00337 6E

FLOCCULATION

Zero Discharge: It Wasn't a Costly Pipedream for One Waterworks, W81-00257 5D

Old Water System Gets New Life, W81-00261 5D

FLOOD CONTROL

Performance and Effects of SCS Floodwater Retarding Structures in the 1979 Easter Floods, W81-00302 4A

Report on Working Group No. 2. Hydrologic Modelling, W81-00466 2E

Report on Working Group No. 3. Stochastic Analysis and Operational Research, W81-00467 2E

SIMPAK for River Basin Studies, W81-00468 2E

Development of a Real-Time Operational Model for the Ottawa River - A Progress Report, W81-00469 2E

Hec-2 Application at Moose Jaw - Input Requirements and Model Performance, W81-00470 2E

Mathematical Modelling of the Fraser River System, W81-00471 2E

Application of the DWOPER Model to the Lower Saint John River, W81-00472 2E

Application of Finite Element Method in River Network Hydraulics, W81-00473 2E

Mathematical Modelling of Unsteady Flows in Mobile Boundary Channels, W81-00474 2E

Ice Jamming Concerns and Operational Solutions, W81-00475 2C

Hydraulic Aspects of Ice Jamming, W81-00476 2C

Meteorological Inputs for Hydrological Models, W81-00477 2E

The Need for a Regional Unit Hydrograph Analysis of Ontario, W81-00478 2E

Runoff from Developing Areas, W81-00479 2E

Data Network Design for Watershed Forecasting, W81-00481 2E

Ottawa River - Comparison of the Hydro Quebec and SSARR Models, W81-00482 2E

Short-Term and Long-Term Hydrometeorological Epochs, W81-00483 2E

Hydro Configuration Modelling System, W81-00490 2E

FLOOD DAMAGE

Mississippi Dam Safety Program, W81-00296 8A

Computerized Agricultural Crop Flood Damage Assessment System, W81-00306 2E

Report on Working Group No. 1. Open Channel Hydraulic Modelling, W81-00465 2E

Report on Working Group No. 2. Hydrologic Modelling, W81-00466 2E

Report on Working Group No. 3. Stochastic Analysis and Operational Research, W81-00467 2E

Mathematical Modelling of the Fraser River System, W81-00471 2E

Application of Finite Element Method in River Network Hydraulics, W81-00473 2E

Hydraulic Aspects of Ice Jamming, W81-00476 2C

The Need for a Regional Unit Hydrograph Analysis of Ontario, W81-00478 2E

FLOOD DRAINAGE

Performance and Effects of SCS Floodwater Retarding Structures in the 1979 Easter Floods, W81-00302 4A

FLOOD FORECASTING

SIMPAK for River Basin Studies, W81-00468 2E

Development of a Real-Time Operational Model for the Ottawa River - A Progress Report, W81-00469 2E

Application of the DWOPER Model to the Lower Saint John River, W81-00472 2E

Mathematical Modelling of Unsteady Flows in Mobile Boundary Channels, W81-00474 2E

Meteorological Inputs for Hydrological Models, W81-00477 2E

The Need for a Regional Unit Hydrograph Analysis of Ontario, W81-00478 2E

Flood Forecasting in the Saint John River Basin - Mathematical Modelling Activities, W81-00480 2E

Data Network Design for Watershed Forecasting, W81-00481 2E

Ottawa River - Comparison of the Hydro Quebec and SSARR Models, W81-00482 2E

Short-Term and Long-Term Hydrometeorological Epochs, W81-00483 2E

Flood Frequency Analysis Concerns in the Atlantic Region, W81-00487 2E

A Flexible Family of Stachastic Models, W81-00488 2E

A Procedure for Determining Flood Frequencies for Great Lakes Shorelin e, W81-00491 2E

FLOOD FREQUENCY

The Three Parameter Lognormal Distribution Applied to Regional Flood Frequency Analysis by the Index Flood Method, W81-00484 2E

Flood Frequencies by the Kinematic Wave Model, W81-00485 2E

Flood Frequency Analysis by Power Transformation, W81-00486 2E

Flood Frequency Analysis Concerns in the Atlantic Region, W81-00487 2E

A Procedure for Determining Flood Frequencies for Great Lakes Shorelin e, W81-00491 2E

FLOOD FREQUENCY ANALYSIS

Report on Working Group No. 3. Stochastic Analysis and Operational Research, W81-00467 2E

FLOOD PLAIN INSURANCE

Hydrologic Extreme Value Model and Risk Analysis Applied to Flood Plain Management, W81-00489 2E

FLOOD PLAINS

Nutrient Yield of the Apalachicola River Flood Plain, Florida: River-Quality Assessment Plan, W81-00350 5B

Hydrologic Extreme Value Model and Risk Analysis Applied to Flood Plain Management, W81-00489 2E

FLOOD PROFILES

Application of the DWOPER Model to the Lower Saint John River, W81-00472 2E

FLOOD RISK MAPPING
Ice Jamming Concerns and Operational Solutions,
W81-00475 2C

FLOOD ROUTING
Quick Estimation of Parameters of Muskingum Method of Flood Routing,
W81-00303 2E

Application of the DWOPER Model to the Lower Saint John River,
W81-00472 2E

FLOODING
Winter Water--The Flooding at Boise, Idaho, January 11-12, 1979,
W81-00364 2E

FLOODS
Runoff from Developing Areas,
W81-00479 2E

FLOODWAYS
Hec-2 Application at Moose Jaw - Input Requirements and Model Performance,
W81-00470 2E

FLORIDA
Areas of Natural Recharge to the Floridan Aquifer in Florida,
W81-00345 4B

Water Levels in Artesian and Nonartesian Aquifers of Florida, 1977-78,
W81-00346 2F

The Surficial Aquifer at the U.S. Naval Station Near Mayport, Florida,
W81-00349 2F

Nutrient Yield of the Apalachicola River Flood Plain, Florida: River-Quality Assessment Plan,
W81-00350 5B

Evaluation of a Cavity-Riddled Zone of the Shallow Aquifer Near Riviera Beach, Palm Beach County, Florida,
W81-00351 4B

Hydrologic and Land-Cover Features of the Caloosahatchee River Basin, Lake Okeechobee to Franklin Lock, Florida,
W81-00353 7C

FLORIDAN AQUIFER
Areas of Natural Recharge to the Floridan Aquifer in Florida,
W81-00345 4B

FLOW CHARACTERISTICS
Statistical Analysis of Stream Events,
W81-00298 2E

Channel and Dynamic Flow Characteristics of the Chattahoochee River, Buford Dam to Georgia Highway 141,
W81-00362 8B

FLOW CONTROL
Drip Irrigation System,
W81-00368 3F

FLUID MECHANICS
Particular Solutions to the Problem of Horizontal Flow of Water and Air Through Porous Media Near a Wetting Front,
W81-00496 7B

FLUORESCENT DYE
Mutagenicity in Salmonella of Fluorescent Dye Tablets used in Water Tracing,
W81-00497 5A

FLUVIAL SEDIMENTS
A Field Calibration of the Sediment-Trapping Characteristics of the Helley -Smith Bedload Sampler,
W81-00363 2J

FOAM FRACTIONATION
Spectrophotometric Determination of Traces of Cobalt in Water after Preconcentration on Reagent-Loaded Polyurethane Foams,
W81-00254 7B

FORESTS
Forested Wetlands in Eastern Connecticut: Their Transition Zones and Delineation,
W81-00272 2I

FRESHWATER
Hydrologic and Land-Cover Features of the Caloosahatchee River Basin, Lake Okeechobee to Franklin Lock, Florida,
W81-00353 7C

GARTON PUMP
Enhancement of Release Water Quality by Localized Mixing Lake Okatibbee, MS,
W81-00309 2H

GAS CHROMATOGRAPHY
Experimental Application of Gas Chromatographic Headspace Analysis to Priority Pollutants,
W81-00446 7B

Estimated Application of Gas Chromatographic Headspace Analysis to Priority Pollutants,
W81-00447 7B

Analytical Problem Solving with Verification Samples Interference Reduction Options,
W81-00452 5A

GENETICS
Water Conservation Through Plant Breeding - Alfalfa,
W81-00396 2I

GEOMORPHOLOGY
Some Applications of the Concept of Geomorphic Thresholds,
W81-00342 2J

GEORGIA
Water Resources Data for Georgia, Water Year 1979,
W81-00344 7C

Channel and Dynamic Flow Characteristics of the Chattahoochee River, Buford Dam to Georgia Highway 141,
W81-00362 8B

GLACIERS
Glacier Surveys in British Columbia - 1978,
W81-00385 2C

GORDO AQUIFER (MS)
Potentiometric Map of the Gordo Aquifer in Northeastern Mississippi, September, October, and November 1978,
W81-00359 2F

GOVERNMENT FINANCE
Time for a New Clean Water Program,
W81-00260 6E

GRANGE HALL CREEK (CO)
Hydrologic Data from Upper Grange Hall Creek Basin, Northglenn, Adams County, Colorado,
W81-00366 7C

GRAVITY
Use of Bounding Wells to Negate the Effects of Gravity and Pre-Existing Groundwater Movement in Dipping Aquifers Used for Storage,
W81-00312 4D

GRAVITY DAMS
Random Hydrodynamic Force on Dam from Earthquakes,
W81-00378 8A

GREAT SALT LAKE
Stratified Bidirectional Seepage Flow Through an Earthen Embankment,
W81-00270 2H

GREEN RIVER BASIN (KY)
Green River Basin Flow Forecasting Models,
W81-00329 4A

GROUNDWATER
A Five-Year Plan for Water Resources Research for Texas,
W81-00287 6E

Water Resources Data for Maine, Water Year 1979,
W81-00343 7C

Water Resources Data for Georgia, Water Year 1979,
W81-00344 7C

Areas of Natural Recharge to the Floridan Aquifer in Florida,
W81-00345 4B

Water Resources Data for New Jersey, Water Year 1979--Volume 1. Atlantic Slope Basins, Hudson River to Cape May,
W81-00347 7C

Water Resources Data for New Jersey, Water Year 1979--Volume 2. Delaware River Basin and Tributaries to Delaware Bay,
W81-00348 7C

The Surficial Aquifer at the U.S. Naval Station Near Mayport, Florida,
W81-00349 2F

Potentiometric Map of the Coffee Sand Aquifer in Northeastern Mississippi, October and November 1978,
W81-00356 2F

Potentiometric Map of the Eutaw-Mc Shan Aquifer in Northeastern Mississippi, September, October, and November 1978,
W81-00357 2F

Potentiometric Map of the Ripley Aquifer in Northeastern Mississippi, October and November 1978,
W81-00358 2F

Potentiometric Map of the Gordo Aquifer in Northeastern Mississippi, September, October, and November 1978,
W81-00359 2F

GROUNDWATER AVAILABILITY
Ground Water Mining and Western Water Rights Law: The Nebraska Experience,
W81-00269 6E

GROUNDWATER DEPLETION
A Five-Year Plan for Water Resources Research in Arizona,
W81-00282 6E

GROUNDWATER MANAGEMENT (APPLIED)
Ground Water Mining and Western Water Rights Law: The Nebraska Experience,
W81-00269 6E

GROUNDWATER MINING
Ground Water Mining and Western Water Rights Law: The Nebraska Experience,
W81-00269 6E

GROUNDWATER MOVEMENT
Use of Bounding Wells to Negate the Effects of Gravity and Pre-Existing Groundwater Movement in Dipping Aquifers Used for Storage,
W81-00312 4D

Salinity Effects on Hydraulic Properties of Soils,
W81-00415 2G

GROUNDWATER RESOURCES
Water Levels in Artesian and Nonartesian Aquifers of Florida, 1977-78, W81-00346 2F

Evaluation of a Cavity-Riddled Zone of the Shallow Aquifer Near Riviera Beach, Palm Beach County, Florida, W81-00351 4B

GUAM
Five-Year Water Research and Development Plan for Guam and Micronesia FY 82 Through FY 86, W81-00333 6E

GYPSUM
Influence of Size of Gypsum Particles on the Hydraulic Conductivity of Soils, W81-00413 2G

HALOPHYTES
Saline Water Utilization - An International Perspective, W81-00395 3C

HARRISBURG (PA)
Suspended-Sediment Discharge, in Five Streams Near Harrisburg, Pennsylvania, Before, During, and After Highway Construction, W81-00361 4C

HAZARDOUS WASTES
Five Year Research and Development Plan for the Rhode Island Water Resources Center, W81-00334 6E

HEAT BALANCE
Incineration is a Waste-Management Alternative, W81-00443 5E

HEAT TRANSFER
Scale Reduction in Physical Hydraulic Models of Thermal Discharges, W81-00327 5G

HEAT TREATMENT
Sludge Treatment Vs. Energy Conservation, W81-00439 5E

HEAVY METALS
Control of Pollution in Waters Containing Heavy Metals, W81-00323 5G

Application of Current Methods for Metals Determination in Wastewaters from the Organics/Plastics Industry, W81-00450 5A

HELLEY-SMITH BEDLOAD SAMPLER
A Field Calibration of the Sediment-Trapping Characteristics of the Helley -Smith Bedload Sampler, W81-00363 2J

HERBICIDES
Content and Distribution Patternof 2, 4-D in the Red River, W81-00382 5B

Leaching Losses of Two Nutrients and an Herbicide from Two Sandy Soils During Transient Drainage, W81-00414 5B

Effects of Roundup Herbicide on Populations of Daphnia Magna in a Forest Pond, W81-00435 5C

HISTORY
Glacier Surveys in British Columbia - 1978, W81-00385 2C

Disputes over Water Quality Policy: Professional Cultures in Conflict, 1900-1917, W81-00407 5F

HOUSTON
Two Approaches to Identify Storm Water Runoff Loads, W81-00310 4C

HUNTINGTON COUNTY (IN)
A One-Dimensional, Steady-State, Dissolved-Oxygen Model and Waste-Load Assimilation Study for the Wabash River, Huntington County, Indiana, W81-00354 5B

HYDRAULIC CONDUCTIVITY
Investigation of a Surface Resistivity Technique for the Estimation of Hydraulic Conductivity in Stratified Drift Aquifers, W81-00267 8B

Influence of Size of Gypsum Particles on the Hydraulic Conductivity of Soils, W81-00413 2G

Salinity Effects on Hydraulic Properties of Soils, W81-00415 2G

HYDRAULIC MODELS
Scale Reduction in Physical Hydraulic Models of Thermal Discharges, W81-00327 5G

Report on Working Group No. 1. Open Channel Hydraulic Modelling, W81-00465 2E

HYDROGRAPH ANALYSIS
The Need for a Regional Unit Hydrograph Analysis of Ontario, W81-00478 2E

HYDROLOGIC BUDGET
Hydrologic Budget for Eagle Lake Near Willmar, Minnesota, W81-00365 2H

HYDROLOGIC DATA
Water Resources Data for Maine, Water Year 1979, W81-00343 7C

Water Resources Data for Georgia, Water Year 1979, W81-00344 7C

Water Resources Data for New Jersey, Water Year 1979--Volume 1. Atlantic Slope Basins, Hudson River to Cape May, W81-00347 7C

Water Resources Data for New Jersey, Water Year 1979--Volume 2. Delaware River Basin and Tributaries to Delaware Bay, W81-00348 7C

Hydrologic Data from Upper Grange Hall Creek Basin, Northglenn, Adams County, Colorado, W81-00366 7C

Basin Study: Bathurst Islands, 1976, W81-00463 2A

Ice Jamming Concerns and Operational Solutions, W81-00475 2C

Data Network Design for Watershed Forecasting, W81-00481 2E

HYDROLOGIC EQUATION
Hydrologic Budget for Eagle Lake Near Willmar, Minnesota, W81-00365 2H

HYDROLOGIC MODELS
Report on Working Group No. 2. Hydrologic Modelling, W81-00466 2E

Meteorological Inputs for Hydrological Models, W81-00477 2E

Runoff from Developing Areas, W81-00479 2E

HYDROMETEOROLOGY
Runoff from Developing Areas, W81-00479 2E

Short-Term and Long-Term Hydrometeorological Epochs, W81-00483 2E

HYDROMETRIC MODELS
Ottawa River - Comparison of the Hydro Quebec and SSARR Models, W81-00482 2E

ICE JAMS
Ice Jamming Concerns and Operational Solutions, W81-00475 2C

Hydraulic Aspects of Ice Jamming, W81-00476 2C

IDAHO
The Allocation of Water to Instream Flows, Volume I: A Comparative Study of Policy Making and Technical Information in the States of Colorado, idaho, Montana, and Washington, W81-00317 6E

The Allocation of Water to Instream Flows, Volume III: Idaho Water Resources Management, W81-00319 6E

A Five-Year Plan for Water Resources Research and Associated Technology Transfer Needs, W81-00330 6E

Winter Water--The Flooding at Boise, Idaho, January 11-12, 1979, W81-00364 2E

ILLINOIS
A 1982-87 Research Program for the University of Illinois Water Resources Center, W81-00281 6E

INCINERATION
Sewage-Sludge Incineration Raises Air Pollution Concerns, W81-00442 5E

Incineration is a Waste-Management Alternative, W81-00443 5E

INDIANA
Indiana Five-Year Water Resources Research and Development Plan, Fiscal Years 1982-1986, W81-00279 6E

A One-Dimensional, Steady-State, Dissolved-Oxygen Model and Waste-Load Assimilation Study for the Wabash River, Huntington County, Indiana, W81-00354 5B

INDICATORS
Effects of Prudhoe Bay Crude Oil Contamination on Sediment Working Rates of Abarenicola Pacifica, W81-00441 5C

W81-00332 6E

KENTUCKY
Five-Year Water Resources Research Program,
W81-00285 6E

Green River Basin Flow Forecasting Models,
W81-00329 4A

LABORATORY EQUIPMENT
Use of Bounding Wells to Negate the Effects of Gravity and Pre-Existing Groundwater Movement in Dipping Aquifers Used for Storage,
W81-00312 4D

LABORATORY TESTS
Further Investigations of Alumina-Lime-Soda Water Recovery Applications,
W81-00316 5G

LAGOONS
The Water-Fern Salvinia Molesta in the Sepik River, Papua New Guinea,
W81-00431 5C

LAKE BELEWS (NC)
Scale Reduction in Physical Hydraulic Models of Thermal Discharges,
W81-00327 5G

LAKE ERIE
Impact of Iron Discharges from Wastewater Treatment Plants on Algal Growth and Species Composition,
W81-00265 5C

LAKE FISHERIES
Analysis of Risk in Using Lake Water Supplies for Salmon Hatcheries in Alaska,
W81-00313 6B

LAKE MICHIGAN
Relationship of Per Cent Mortality of Four Species of Aquatic Biota from 96-Hour Sediment Bioassays of Five Lake Michigan Harbors and Elutriate Chemistry of the Sediments,
W81-00436 5C

LAKE MORPHOLOGY
A Trophic Classification of Minnesota Lakes Based on Lake Sediments,
W81-00322 2H

LAKE SAMMAMISH (WA)
Lake Sammamish Response to Wastewater Fiversion and Increasing Urban Runoff,
W81-00274 2H

LAKE SEDIMENTS
A Trophic Classification of Minnesota Lakes Based on Lake Sediments,
W81-00322 2H

LAKES
Occurrence and Regulatory Role of Cyclic Adenosine Monophosphate in the Nutrient Dynamics of Controlled and Natural Communities of Lakes,
W81-00266 2H

Lake Sammamish Response to Wastewater Fiversion and Increasing Urban Runoff,
W81-00274 2H

Differential C02 and 02 Benthic Community Metabolism in a Soft-Water Lake,
W81-00341 2H

Hydrologic Budget for Eagle Lake Near Willmar, Minnesota,
W81-00365 2H

The Potential for Nitrogen Fixation in a Lake Receiving Sewage Effluent (Grasmere, English Lake District),
W81-00404 5C

Variability in Microbiological Data from a Stratified Eutrophic Lake,
W81-00405 2H

Lake Weeds can be Controlled,
W81-00418 5C

Possible Effects of Phosphorus on Algal Growth in Barton Broad and Related Control Measures,
W81-00430 5C

The Water-Fern Salvinia Molesta in the Sepik River, Papua New Guinea,
W81-00431 5C

Physiological Adapatations in Response to Environmental Stress During an N2-Fixing Anabaena Bloom,
W81-00449 2H

LANDFILLS
Leachate Control Doesn't Come Easy,
W81-00423 5D

LEACHATE
Leachate Control Doesn't Come Easy,
W81-00423 5D

LEACHING
Leaching Losses of Two Nutrients and an Herbicide from Two Sandy Soils During Transient Drainage,
W81-00414 5B

LEAD
Direct Determination of Lead in Polluted Sea Water by Carbon-Furnace Atomic Absorption Spectrometry,
W81-00253 5A

Old Water System Gets New Life,
W81-00261 5D

Water Quality Degredation Due to Non-Point Pollution from Urban Sources,
W81-00339 5B

LEGAL ASPECTS
Mine Dewatering,
W81-00398 6E

LEGISLATION
Federal Water Legislation,
W81-00399 6A

LINEAR PROGRAMMING
Hydro Configuration Modelling System,
W81-00490 2E

LIONS RIVER (SOUTH AFRICA)
The Influence of P-Retention by Soils and Sediments on the Water Quality of the Lions River,
W81-00338 5B

LOCAL GOVERNMENTS
Time for a New Clean Water Program,
W81-00260 6E

LOUISIANA
A Field Test of Environmental Impact Assessment in the Tensas Basin,
W81-00297 6B

Five-Year Plan for the Louisiana Water Resources Research Institute, 1980-85,
W81-00335 6E

LYSIMETERS
An Instrumented Lysimeter System for Monitoring Salt and Water Movement,
W81-00273 2G

MAINE
Water Resources Data for Maine, Water Year 1979,
W81-00343 7C

MANAGEMENT
Stormwater Management in the United States A Study of Institutional Problems, Solutions and Impacts,
W81-00263 4A

Report on Working Group No. 1. Open Channel Hydraulic Modelling,
W81-00465 2E

MANITOBA
Aspects of River Morphology,
W81-00460 8B

MAPS
Areas of Natural Recharge to the Floridan Aquifer in Florida,
W81-00345 4B

Hydrologic and Land-Cover Features of the Caloosahatchee River Basin, Lake Okeechobee to Franklin Lock, Florida,
W81-00353 7C

Potentiometric Map of the Coffee Sand Aquifer in Northeastern Mississippi, October and November 1978,
W81-00356 2F

Potentiometric Map of the Eutaw-Mc Shan Aquifer in Northeastern Mississippi, September, October, and November 1978,
W81-00357 2F

Potentiometric Map of the Ripley Aquifer in Northeastern Mississippi, October and November 1978,
W81-00358 2F

Potentiometric Map of the Gordo Aquifer in Northeastern Mississippi, September, October, and November 1978,
W81-00359 2F

MASS FRAGMENTOGRAPHY
Mass Fragmentographic Determination of Polymethylnaphthalene and Polymethylphenanthrene in a Crude Oil and in Marine Organisms,
W81-00437 7B

MATHEMATICAL MODELS
Analysis of Risk in Using Lake Water Supplies for Salmon Hatcheries in Alaska,
W81-00313 6B

Surge Tank Water Level Variations Following Rapid Valve Opening,
W81-00409 7B

Mathematical Modelling of the Fraser River System,
W81-00471 2E

Mathematical Modelling of Unsteady Flows in Mobile Boundary Channels,
W81-00474 2E

Flood Forecasting in the Saint John River Basin - Mathematical Modelling Activities,
W81-00480 2E

MATHEMATICAL STUDIES
Particular Solutions to the Problem of Horizontal Flow of Water and Air Through Porous Media Near a Wetting Front,
W81-00496 7B

MATHEMATICAT MODELS
Use of Bounding Wells to Negate the Effects of Gravity and Pre-Existing Groundwater Movement in Dipping Aquifers Used for Storage,
W81-00312 4D

MATHEMATICL MODELS
Flood Frequencies by the Kinematic Wave Model,
W81-00485 2E

MAYFLIES
Respiration of Aquatic Insect Larvae (Ephemeroptera, Plecoptera) in Acid Mine Water,
W81-00420 5C

METEOROLOGY
Meteorological Inputs for Hydrological Models,
W81-00477 2E

MIAMI
Two Approaches to Identify Storm Water Runoff Loads,
W81-00310 4C

MICROBIOLOGY
Variability in Microbiological Data from a Stratified Eutrophic Lake,
W81-00405 2H

Microbiology of a Pesticide Disposal Pit,
W81-00455 5E

MICROEXTRACTION
Priority Pollutant Analyses of Industrial Wastewaters Using a Microextraction Approach,
W81-00445 7B

An Evaluation of Factors Affecting the Microextraction of Benzene, Toluene, Ethylbenzene and O-xylene into Pentane,
W81-00453 7B

MICRONESIA
Five-Year Water Research and Development Plan for Guam and Micronesia FY 82 Through FY 86,
W81-00333 6E

MIDMAR DAM CATCHMENT (SOUTH AFRICA)
The Influence of P-Retention by Soils and Sediments on the Water Quality of the Lions River,
W81-00338 5B

MINE DEWATERING ACT
Mine Dewatering,
W81-00398 6E

MINE WATER
Mine Dewatering,
W81-00398 6E

MINING
Mine Dewatering,
W81-00398 6E

MINNESOTA
Environmental Impact of a Nuclear Plant on Mississippi River Biota in an Ecological Recovery Zone Near Red Wing, Minnesota,
W81-00262 5C

A Trophic Classification of Minnesota Lakes Based on Lake Sediments,
W81-00322 2H

Hydrologic Budget for Eagle Lake Near Willmar, Minnesota,
W81-00365 2H

MIREX
Effects of Water-Borne Mirex on the Survival and Production of Macrobrachium Rosenbergii (De Man),
W81-00326 5C

MISSISSIPPI
Five-Year Water Resources Research and Development Plan: Fiscal Years 1982-1986,
W81-00289 9D

Proceedings, 14th Annual Mississippi Water Resources Conference, 24-25 September 1979,
W81-00290 2E

Mississippi Dam Safety Program,
W81-00296 8A

Statistical Analysis of Stream Events,
W81-00298 2E

Geologic and Geomorphic Aspects of Streambank Erosion in the Yazoo Hill Streams,
W81-00299 2J

Sediment Sources and Yields from Upland Watersheds in North Mississippi,
W81-00300 2J

Performance and Effects of SCS Floodwater Retarding Structures in the 1979 Easter Floods,
W81-00302 4A

Expanded Floodplain Information Study for the Wolf River Basin, Tennessee and Mississippi: A Computer Simulation,
W81-00305 2E

Potentiometric Map of the Coffee Sand Aquifer in Northeastern Mississippi, October and November 1978,
W81-00356 2F

Potentiometric Map of the Eutaw-Mc Shan Aquifer in Northeastern Mississippi, September, October, and November 1978,
W81-00357 2F

Potentiometric Map of the Ripley Aquifer in Northeastern Mississippi, October and November 1978,
W81-00358 2F

Potentiometric Map of the Gordo Aquifer in Northeastern Mississippi, September, October, and November 1978,
W81-00359 2F

MISSISSIPPI RIVER
Environmental Impact of a Nuclear Plant on Mississippi River Biota in an Ecological Recovery Zone Near Red Wing, Minnesota,
W81-00262 5C

Five-Year Water Resources Research and Development Goals and Objectives,
W81-00286 6E

Variations of a Mississippi River Crossing with Stage,
W81-00304 2E

MISSOURI
Five-Year Water Resources Research and Development Goals and Objectives,
W81-00286 6E

MISSOURI RIVER
Five-Year Water Resources Research and Development Goals and Objectives,
W81-00286 6E

MIXING
Boundary Mixing in Density-Stratifield Fluids,
W81-00390 1A

MODEL STUDIES
Stratified Bidirectional Seepage Flow Through an Earthen Embankment,
W81-00270 2H

Green River Basin Flow Forecasting Models,
W81-00329 4A

A One-Dimensional, Steady-State, Dissolved-Oxygen Model and Waste-Load Assimilation Study for the Wabash River, Huntington County, Indiana,
W81-00354 5B

A Practical Lagrangian Transport Model,
W81-00360 5B

Channel and Dynamic Flow Characteristics of the Chattahoochee River, Buford Dam to Georgia Highway 141,
W81-00362 8B

Spatial Simulation of Snow Processes,
W81-00381 2C

Knickpoint Migration Due to Baselevel Lowering,
W81-00401 2J

Development of a Real-Time Operational Model for the Ottawa River - A Progress Report,
W81-00469 2E

Hec-2 Application at Moose Jaw - Input Requirements and Model Performance,
W81-00470 2E

Application of the DWOPER Model to the Lower Saint John River,
W81-00472 2E

Ice Jamming Concerns and Operational Solutions,
W81-00475 2C

Flood Frequency Analysis by Power Transformation,
W81-00486 2E

Hydro Configuration Modelling System,
W81-00490 2E

A Procedure for Determining Flood Frequencies for Great Lakes Shorelin e,
W81-00491 2E

MODELS
Creep and Glide Processes in Mountain Snowpacks,
W81-00387 2C

MOISTURE AVAILABILITY
Water Conservation Through Plant Breeding - Alfalfa,
W81-00396 2I

MONITORING
A Remote Monitoring System for Water Quality Parameters,
W81-00307 7B

MONTANA
The Allocation of Water to Instream Flows, Volume I: A Comparative Study of Policy Making and Technical Information in the States of Colorado, idaho, Montana, and Washington,
W81-00317 6E

The Allocation of Water to Instream Flows, Volume IV: Montana Water Resources Management,
W81-00320 6E

MORTALITY
Relationship of Per Cent Mortality of Four Species of Aquatic Biota from 96-Hour Sediment Bioassays of Five Lake Michigan Harbors and Elutriate Chemistry of the Sediments,
W81-00436 5C

MUNICIPAL WASTES
Industrial Cost Recovery: Why it Should be Killed,
W81-00259 6E

MUNICIPAL WATER
Should I Arbitrate or Litigate.
W81-00444 6E

MUSKINGUM METHOD
Quick Estimation of Parameters of Muskingum Method of Flood Routing,
W81-00303 2E

MUTAGENS
Mutagenic Activity in Drinking Water,
W81-00408 5C

NATURAL RECHARGE
Areas of Natural Recharge to the Floridan Aquifer in Florida,
W81-00345 4B

NATURAL RESOURCES
United States Geological Survey Yearbook, Fiscal Year 1979.
W81-00352 7C

The Impact of Energy Development on Water Resources,
W81-00397 3E

NEBRASKA
Ground Water Mining and Western Water Rights Law: The Nebraska Experience,
W81-00269 6E

Nebraska Water Resources Center Five-Year Water Resources Research Program, 1982-1987,
W81-00337 6E

NETWORK DESIGN
Data Network Design for Watershed Forecasting,
W81-00481 2E

NEW ENGLAND
Investigation of a Surface Resistivity Technique for the Estimation of Hydraulic Conductivity in Stratified Drift Aquifers,
W81-00267 8B

NEW JERSEY
Water Resources Data for New Jersey, Water Year 1979--Volume 1. Atlantic Slope Basins, Hudson River to Cape May,
W81-00347 7C

Water Resources Data for New Jersey, Water Year 1979--Volume 2. Delaware River Basin and Tributaries to Delaware Bay,
W81-00348 7C

NEW MEXICO
Water Resources Research - The Early Years,
W81-00391 6E

A Historical Perspective of Water Management in New Mexico,
W81-00392 6E

Importance of Crop Production Functions in Evaluating Consumptive use of Water,
W81-00393 3F

Water Resources of the Rio Grande An Interdisciplinary Approach,
W81-00394 6A

Saline Water Utilization - An International Perspective,
W81-00395 3C

The Impact of Energy Development on Water Resources,
W81-00397 3E

Mine Dewatering,
W81-00398 6E

The Impact of Desalting on Water Supply - Alamogordo, New Mexico,
W81-00400 5F

NEW YORK BAY
Fate of Coliform Bacteria in the Upper New York Bay,
W81-00324 5A

NITRIFICATION
Removal of Nitrogen from Industrial Waste Waters by Biological Nitrification-Denitrification,
W81-00425 5D

The Effects of Nitrate Concentration and Retention Period on Biological Denitrification in the Rotating-Disc System,
W81-00428 5D

Effect of Systems Solids Retention Time (SSRT or Sludge Age) on Nitrogen Removal from Activated-Sludge Systems,
W81-00429 5D

NITROGEN COMPOUNDS
Leaching Losses of Two Nutrients and an Herbicide from Two Sandy Soils During Transient Drainage,
W81-00414 5B

NITROGEN CYCLE
The Effect of Nitrate on Nitrous Oxide Reduction in Organic Soils and Sediments,
W81-00311 2K

NITROGEN FIXATION
Physiological Adapatations in Response to Environmental Stress During an N2-Fixing Anabaena Bloom,
W81-00449 2H

NITROGEN FIXING BACTERIA
The Potential for Nitrogen Fixation in a Lake Receiving Sewage Effluent (Grasmere, English Lake District),
W81-00404 5C

NORTH CAROLINA
North Carolina's Five-Year Water Research Program for 1982-1987,
W81-00280 6E

Water Resources in North Carolina,
W81-00325 9C

NORTH DAKOTA
Water Resources Research Five-Year Plan/ 1982-1987,
W81-00331 6E

NORTHERN DEVELOPMENT
Water-Related Environmental Factors,
W81-00458 6E

Aspects of Drainage Basin Morphometry of Relevance to Arctic Hydrology,
W81-00459 2J

Morphometric and Hydraulic Data Collection Programs,
W81-00461 7A

A Biologist's View on the Role of Water Chemistry in Environmental Assessment,
W81-00462 1A

Discussion on Snowmelt,
W81-00464 2C

NORTHGLENN (CO)
Hydrologic Data from Upper Grange Hall Creek Basin, Northglenn, Adams County, Colorado,
W81-00366 7C

NUCLEAR POWERPLANTS
Environmental Impact of a Nuclear Plant on Mississippi River Biota in an Ecological Recovery Zone Near Red Wing, Minnesota,
W81-00262 5C

An Economic Analysis of the Effects of Regulatory Delay on Nuclear Power Plant Construction,
W81-00328 6B

NUMERICAL ANALYSIS
Application of Finite Element Method in River Network Hydraulics,
W81-00473 2E

Mathematical Modelling of Unsteady Flows in Mobile Boundary Channels,
W81-00474 2E

NUTRIENT REMOVAL
Possible Effects of Phosphorus on Algal Growth in Barton Broad and Related Control Measures,
W81-00430 5C

NUTRIENTS
Occurrence and Regulatory Role of Cyclic Adenosine Monophosphate in the Nutrient Dynamics of Controlled and Natural Communities of Lakes,
W81-00266 2H

Nutrient Yield of the Apalachicola River Flood Plain, Florida: River-Quality Assessment Plan,
W81-00350 5B

Method for Bringing Nutrient-Rich Water from the Aphotic Zone of the Ocean to the Photic Zone,
W81-00367 3A

OIL
Mass Fragmentographic Determination of Polymethylnaphthalene and Polymethylphenanthrene in a Crude Oil and in Marine Organisms,
W81-00437 7B

Toxicity of a Fuel Oil to the Eggs of Parhyale Hawaiensis and Amphithoe Valida (Amphipoda),
W81-00440 5C

OIL POLLUTION
Uptake of Trace Metals by the Clam Macoma Inquinata from Clean and Oil-Contaminated Detritus,
W81-00434 5C

Effects of Prudhoe Bay Crude Oil Contamination on Sediment Working Rates of Abarenicola Pacifica,
W81-00441 5C

OIL SPILLS
Development of an Oil Spill Model for the St. Lawrence River,
W81-00386 5B

OKLAHOMA
Control of Pollution in Waters Containing Heavy Metals,
W81-00323 5G

OPEN CHANNEL FLOW
Channel and Dynamic Flow Characteristics of the Chattahoochee River, Buford Dam to Georgia Highway 141,
W81-00362 8B

Report on Working Group No. 1. Open Channel Hydraulic Modelling,
W81-00465 2E

OPERATION AND MAINTENANCE
Tennessee-Tombigbee Waterway: Project Operation, Cultural and Recreation Resources Development,
W81-00293 8A

OREGON
Water Resources Research Plan for Oregon for the Period 1982-1987,
W81-00284 9D

ORGANIC MATTER
Chemical and Microbiological Impact of Sewage Sludge on Soil Systems,
W81-00275 5D

ORGANIC SOILS
The Effect of Nitrate on Nitrous Oxide Reduction in Organic Soils and Sediments,
W81-00311 2K

ORGANIC WASTES
The Collection, Treatment, and Disposal of Farm Wastes,
W81-00251 5D

Experimental Application of Gas Chromatographic Headspace Analysis to Priority Pollutants,
W81-00446 7B

Application of Current Methods for Metals Determination in Wastewaters from the Organics/Plastics Industry,
W81-00450 5A

Approach to Quality Assurance/Quality Control in the Organic Chemicals Industry Monitoring Program,
W81-00451 7B

Determination of Biological Removal of Organic Constituents in Quench Waters from High-Btu Coal-Gasification Pilot Plants,
W81-00500 5D

ORGANOPHOSPHORUS PESTICIDES
Identification and Confirmation of Atrazine in Pond Water,
W81-00412 5A

OUTFALL SEWERS
Ammonium Input to the Sea Via Large Sewage Outfalls-Part I: Tracing Sewage in Southern California Waters,
W81-00426 5C

OXADIAZON
Occurrence of Herbicide Oxadiazon in Surface Waters and Tap Water,
W81-00402 5B

OXIDATION
The Collection, Treatment, and Disposal of Farm Wastes,
W81-00251 5D

Removal of Organics in Water Using Hydrogen Peroxide in Presence of Ultraviolet Light,
W81-00498 5F

OXYGEN ACTIVATED SLUDGE
EBMUD: Award Winning Sewage Works,
W81-00421 5D

OXYGENATION
Reaeration Tests, Enid Lake Outlet Works,
W81-00308 8B

OYSTERS
Mass Fragmentographic Determination of Polymethylnaphthalene and Polymethylphenanthrene in a Crude Oil and in Marine Organisms,
W81-00437 7B

OZONE
The Mechanism of Ozone Inactivation of Waterborne Viruses,
W81-00315 5F

PALM BEACH COUNTY (FL)
Evaluation of a Cavity-Riddled Zone of the Shallow Aquifer Near Riviera Beach, Palm Beach County, Florida,
W81-00351 4B

PARAMETERIC HYDROLOGY
Flood Frequency Analysis Concerns in the Atlantic Region,
W81-00487 2E

PARTICLE SIZE
A Field Calibration of the Sediment-Trapping Characteristics of the Helley -Smith Bedload Sampler,
W81-00363 2J

PATENTS
Method for Bringing Nutrient-Rich Water from the Aphotic Zone of the Ocean to the Photic Zone,
W81-00367 3A

Drip Irrigation System,
W81-00368 3F

Self-Correcting Linearly Movable Irrigation System,
W81-00369 3F

Simplified Irrigation Controller,
W81-00370 3F

Debris Separation and Disposal System,
W81-00371 5G

Gas Treatment of Liquid,
W81-00372 5D

Novel Compositions of Matter for Use in the Treatment of Aqueous Systems,
W81-00373 5G

Waste Water Treatment,
W81-00374 5D

Process and Apparatus for Maintaining a Desired Depth of a Waterway,
W81-00375 8A

Apparatus for Controlled Chlorination of Water with an Alkali Metal Dichloroisocyanurate,
W81-00376 5F

Water Softening System,
W81-00377 5G

PATH OF POLLUTANTS
Arsenic Cycling in Marine Systems,
W81-00403 5B

Behaviour of 12 Insecticides in Soil and Aqueous Suspensions of Soil and Sediment,
W81-00499 5B

PATHOGENIC BACTERIA
Bacterial Die-Off and Stream Transport Studies,
W81-00492 5D

PENNSYLANIA
Suspended-Sediment Discharge, in Five Streams Near Harrisburg, Pennsylvania, Before, During, and After Highway Construction,
W81-00361 4C

PESTICIDE KINETICS
Occurrence of Herbicide Oxadiazon in Surface Waters and Tap Water,
W81-00402 5B

Behaviour of HCH (1,2,3,4,5,6-Hexachlorocyclohexane) Residue in the Aquatic Environment,
W81-00410 5B

Behaviour of 12 Insecticides in Soil and Aqueous Suspensions of Soil and Sediment,
W81-00499 5B

PESTICIDES
Effects of Water-Borne Mirex on the Survival and Production of Macrobrachium Rosenbergii (De Man),
W81-00326 5C

Microbiology of a Pesticide Disposal Pit,
W81-00455 5E

PHENOLS
Solubilities of Phenol and Chlorinated Phenols in Supercritical Carbon Dioxide,
W81-00340 5A

PHOSPHORUS
Occurrence and Regulatory Role of Cyclic Adenosine Monophosphate in the Nutrient Dynamics of Controlled and Natural Communities of Lakes,
W81-00266 2H

Lake Sammamish Response to Wastewater Fiversion and Increasing Urban Runoff,
W81-00274 2H

Removal of Eutrophic Nutrients from Wastewater and Their Bioconversion to Bacterial Single Cell Protein for Animal Feed Supplements: Phase I,
W81-00276 5D

Removal of Eutrophic Nutrients from Wastewater and Their Bioconversion to Bacterial Single Cell Protein for Animal Feed Supplements: Phase II,
W81-00277 5D

Removal of Eutrophic Nutrients from Wastewater and Their Bioconversion to Bacterial Single Cell Protein for Animal Feed Supplements: Phase III,
W81-00278 5D

Possible Effects of Phosphorus on Algal Growth in Barton Broad and Related Control Measures,
W81-00430 5C

PHOSPHORUS COMPOUNDS
The Influence of P-Retention by Soils and Sediments on the Water Quality of the Lions River,
W81-00338 5B

PHYSICS
Creep and Glide Processes in Mountain Snowpacks,
W81-00387 2C

PHYTOPLANKTON
Impact of Iron Discharges from Wastewater Treatment Plants on Algal Growth and Species Composition,
W81-00265 5C

Lake Sammamish Response to Wastewater Fiversion and Increasing Urban Runoff,
W81-00274 2H

Ammonium Input to the Sea Via Large Sewage Outfalls-Part I: Tracing Sewage in Southern California Waters,
W81-00426 5C

Ammonium Input to the Sea Via Large Sewage Outfalls - Part 2: Effects of Ammonium on Growth and Photosynthesis of Southern California Phytoplankton Cultures,
W81-00427 5C

PLANNING
Indiana Five-Year Water Resources Research and Development Plan, Fiscal Years 1982-1986,
W81-00279 6E

Five-Year Water Resources Research and Development Plan: Fiscal Years 1982-1986,
W81-00289 9D

Water Resources Research Five-Year Plan/ 1982-1987,
W81-00331 6E

Five-Year Plan of the Puerto Rico Water Resources Research Institute,
W81-00336 6E

Nebraska Water Resources Center Five-Year Water Resources Research Program, 1982-1987,
W81-00337 6E

Federal Water Legislation,
W81-00399 6A

PLANT BREEDING
Saline Water Utilization - An International Perspective,
W81-00395 3C

Water Conservation Through Plant Breeding - Alfalfa,
W81-00396 2I

PLANTING MANAGEMENT
Water Conservation Through Plant Breeding - Alfalfa,
W81-00396 2I

POLLUTANT IDENTIFICATION
Priority Pollutant Analyses of Industrial Wastewaters Using a Microextraction Approach,
W81-00445 7B

Experimental Application of Gas Chromatographic Headspace Analysis to Priority Pollutants,
W81-00446 7B

Estimated Application of Gas Chromatographic Headspace Analysis to Priority Pollutants,
W81-00447 7B

Analytical Problem Solving with Verification Samples Interference Reduction Options,
W81-00452 5A

Characteristics of Gel Chromatography Using Sephadex Gel for Fractionation of Soluble Organic Pollutants,
W81-00493 7B

POLLUTANTS
Control of Pollution in Waters Containing Heavy Metals,
W81-00323 5G

PONDS
Effects of Roundup Herbicide on Populations of Daphnia Magna in a Forest Pond,
W81-00435 5C

Oxygen Exchange Between A 'Model' Pond and the Atmosphere,
W81-00495 2D

POTABLE WATER
Occurrence of Herbicide Oxadiazon in Surface Waters and Tap Water,
W81-00402 5B

Cancer Incidence and Trihalomethane Concentrations in a Public Drinking Water System,
W81-00406 5C

Mutagenic Activity in Drinking Water,
W81-00408 5C

POTASSIUM
Leaching Losses of Two Nutrients and an Herbicide from Two Sandy Soils During Transient Drainage,
W81-00414 5B

POTENTIOMETRIC LEVEL
Potentiometric Map of the Coffee Sand Aquifer in Northeastern Mississippi, October and November 1978,
W81-00356 2F

Potentiometric Map of the Eutaw-Mc Shan Aquifer in Northeastern Mississippi, September, October, and November 1978,
W81-00357 2F

Potentiometric Map of the Ripley Aquifer in Northeastern Mississippi, October and November 1978,
W81-00358 2F

Potentiometric Map of the Gordo Aquifer in Northeastern Mississippi, September, October, and November 1978,
W81-00359 2F

PRE-TREATMENT (WATER)
Planned Processing Beats Back Water-Plant Sludge Disposal Problems,
W81-00438 5F

PRECIPITATION (ATMOSPHERIC)
Five-Year Water Resources Research and Development Goals and Objectives,
W81-00288 9D

PRICING
Estimating Irrigation Water Quantity and Quality,
W81-00271 6D

PROJECT PLANNING
Five-Year Plan for the Louisiana Water Resources Research Institute, 1980-85,
W81-00335 6E

PROJECT PURPOSES
Water Resources of the Rio Grande An Interdisciplinary Approach,
W81-00394 6A

PROJECTS
United States Geological Survey Yearbook, Fiscal Year 1979.
W81-00352 7C

PUBLIC HEALTH
Cancer Incidence and Trihalomethane Concentrations in a Public Drinking Water System,
W81-00406 5C

Disputes over Water Quality Policy: Professional Cultures in Conflict, 1900-1917,
W81-00407 5F

PUERTO RICO
Five-Year Plan of the Puerto Rico Water Resources Research Institute,
W81-00336 6E

PULP WASTES
Secondary Fibres Pulping/Deinking Effluent Toxicity Study,
W81-00388 5C

QUALITY CONTROL
Approach to Quality Assurance/Quality Control in the Organic Chemicals Industry Monitoring Program,
W81-00451 7B

RADIOACTIVE TRACERS
Reaeration Tests, Enid Lake Outlet Works,
W81-00308 8B

RAINFALL
Winter Water--The Flooding at Boise, Idaho, January 11-12, 1979,
W81-00364 2E

RAINFALL-RUNOFF RELATIONSHIPS
Runoff Composition of Soybean Management Systems on Leeper Clay Loam Soil,
W81-00301 2J

RECREATION FACILITIES
Tennessee-Tombigbee Waterway: Project Operation, Cultural and Recreation Resources Development,
W81-00293 8A

RECREATION WASTES
Shipping in the Baltic,
W81-00448 6E

REGIONAL ECONOMICS
Tennessee-Tombigbee Corridor Area: Growth Forecasting and Management,
W81-00294 6B

Income Distribution and Water Resource Projects: Testing the Classical Theory of Economic Development,
W81-00295 6B

REGRESSION ANALYSIS (R-SORT)
Maximizing the Utilities of Social Criteria for Urban Water Management and Planning,
W81-00264 6B

REMOTE SENSING
A Remote Monitoring System for Water Quality Parameters,
W81-00307 7B

RESEARCH
Water Resources Research Support Program 1979-1980,
W81-00383 6E

RESEARCH AND DEVELOPMENT
A Five-Year Plan for Water Resources Research for Texas,
W81-00287 6E

Five-Year Water Resources Research and Development Goals and Objectives,
W81-00288 9D

Water Resources Research Five-Year Plan/ 1982-1987,
W81-00331 6E

Five-Year Plan of the Puerto Rico Water Resources Research Institute,
W81-00336 6E

Nebraska Water Resources Center Five-Year Water Resources Research Program, 1982-1987,
W81-00337 6E

Water Resources Research - The Early Years,
W81-00391 6E

RESEARCH FACILITIES
Five-Year Plan for the Louisiana Water Resources Research Institute, 1980-85,
W81-00335 6E

RESEARCH PRIORITIES
Indiana Five-Year Water Resources Research and Development Plan, Fiscal Years 1982-1986,
W81-00279 6E

North Carolina's Five-Year Water Research Program for 1982-1987,
W81-00280 6E

A 1982-87 Research Program for the University of Illinois Water Resources Center,
W81-00281 6E

A Five-Year Plan for Water Resources Research in Arizona,
W81-00282 6E

Vermont Water Resources Research Center Five-Year Plan for Water Resources Research and Development,
W81-00283 6E

Water Resources Research Plan for Oregon for the Period 1982-1987,
W81-00284 9D

Five-Year Water Resources Research Program,
W81-00285 6E

Five-Year Water Resources Research and Development Goals and Objectives,
W81-00286 6E

A Five-Year Plan for Water Resources Research for Texas,
W81-00287 6E

Five-Year Water Resources Research and Development Goals and Objectives,
W81-00288 9D

Five-Year Water Resources Research and Development Plan: Fiscal Years 1982-1986,
W81-00289 9D

Water Resources in North Carolina,
W81-00325 9C

A Five-Year Plan for Water Resources Research and Associated Technology Transfer Needs,
W81-00330 6E

Water Resources Research Five-Year Plan/ 1982-1987,
W81-00331 6E

Five Year Research Plan, 1982-1987,
W81-00332 6E

Five-Year Water Research and Development Plan for Guam and Micronesia FY 82 Through FY 86,
W81-00333 6E

Five Year Research and Development Plan for the Rhode Island Water Resources Center,
W81-00334 6E

Five-Year Plan for the Louisiana Water Resources Research Institute, 1980-85,
W81-00335 6E

Five-Year Plan of the Puerto Rico Water Resources Research Institute,
W81-00336 6E

Nebraska Water Resources Center Five-Year Water Resources Research Program, 1982-1987,
W81-00337 6E

RESERVOIR OPERATION
Green River Basin Flow Forecasting Models,
W81-00329 4A

RESPIRATION
Respiration of Aquatic Insect Larvae (Ephemeroptera, Plecoptera) in Acid Mine Water,
W81-00420 5C

RESPIRATORY QUOTIENTS
Differential C02 and 02 Benthic Community Metabolism in a Soft-Water Lake,
W81-00341 2H

RETENTION
The Influence of P-Retention by Soils and Sediments on the Water Quality of the Lions River,
W81-00338 5B

RETURN FLOW
Make Sewage a Valuable Commodity,
W81-00258 3D

REVIEWS
United States Geological Survey Yearbook, Fiscal Year 1979.
W81-00352 7C

RHODE ISLAND
Five Year Research and Development Plan for the Rhode Island Water Resources Center,
W81-00334 6E

RIO GRANDE
Water Resources of the Rio Grande An Interdisciplinary Approach,
W81-00394 6A

RIPLEY AQUIFER (MS)
Potentiometric Map of the Ripley Aquifer in Northeastern Mississippi, October and November 1978,
W81-00358 2F

RIVER BASINS
Hydrologic and Land-Cover Features of the Caloosahatchee River Basin, Lake Okeechobee to Franklin Lock, Florida,
W81-00353 7C

RIVER FORECASTING
Quick Estimation of Parameters of Muskingum Method of Flood Routing,
W81-00303 2E

RIVER MODELLING
SIMPAK for River Basin Studies,
W81-00468 2E

RIVER QUALITY
Nutrient Yield of the Apalachicola River Flood Plain, Florida: River-Quality Assessment Plan,
W81-00350 5B

RIVERFLOW
A Practical Lagrangian Transport Model,
W81-00360 5B

RIVERS
Nutrient Yield of the Apalachicola River Flood Plain, Florida: River-Quality Assessment Plan,
W81-00350 5B

Aspects of River Morphology,
W81-00460 [illegible]

RIVIERA BEACH (FL)
Evaluation of a Cavity-Riddled Zone of the Shallow Aquifer Near Riviera Beach, Palm Beach County, Florida,
W81-00351 4B

ROAD CONSTRUCTION
Suspended-Sediment Discharge, in Five Streams Near Harrisburg, Pennsylvania, Before, During, and After Highway Construction,
W81-00361 4C

RUNOFF
Report on Working Group No. 2. Hydrologic Modelling,
W81-00466 2E

Runoff from Developing Areas,
W81-00479 2E

SAIPAN
Five-Year Water Research and Development Plan for Guam and Micronesia FY 82 Through FY 86,
W81-00333 6E

SALINE WATER
Saline Water Utilization - An International Perspective,
W81-00395 3C

The Impact of Desalting on Water Supply - Alamogordo, New Mexico,
W81-00400 5F

SALINITY
An Instrumented Lysimeter System for Monitoring Salt and Water Movement,
W81-00273 2G

Salinity Effects on Hydraulic Properties of Soils,
W81-00415 2G

SALMON
Analysis of Risk in Using Lake Water Supplies for Salmon Hatcheries in Alaska,
W81-00313 6B

SAND MINING
Conservation Impacts and Practices of Sand Removal from Dry Bed Oklahoma Rivers,
W81-00380 2J

SANITARY ENGINEERING
Disputes over Water Quality Policy: Professional Cultures in Conflict, 1900-1917,
W81-00407 5F

SATURATED SOILS
The Effect of Nitrate on Nitrous Oxide Reduction in Organic Soils and Sediments,
W81-00311 2K

SCALING
Novel Compositions of Matter for Use in the Treatment of Aqueous Systems,
W81-00373 5G

SCREENS
Microscsreens Polish Lagoon Effluent,
W81-00432 5D

SEA WATER
Direct Determination of Lead in Polluted Sea Water by Carbon-Furnace Atomic Absorption Spectrometry,
W81-00253 5A

Ammonium Input to the Sea Via Large Sewage Outfalls - Part 2: Effects of Ammonium on Growth and Photosynthesis of Southern California Phytoplankton Cultures,
W81-00427 5C

Uptake of Trace Metals by the Clam Macoma Inquinata from Clean and Oil-Contaminated Detritus,
W81-00434 5C

SEDIMENT DISCHARGE
Suspended-Sediment Discharge, in Five Streams Near Harrisburg, Pennsylvania, Before, During, and After Highway Construction,
W81-00361 4C

SEDIMENT LOAD
Runoff Composition of Soybean Management Systems on Leeper Clay Loam Soil,
W81-00301 2J

SEDIMENT TRANSPORT
Runoff Composition of Soybean Management Systems on Leeper Clay Loam Soil,
W81-00301 2J

Suspended-Sediment Discharge, in Five Streams Near Harrisburg, Pennsylvania, Before, During, and After Highway Construction,
W81-00361 4C

Knickpoint Migration Due to Baselevel Lowering,
W81-00401 2J

Effects of Prudhoe Bay Crude Oil Contamination on Sediment Working Rates of Abarenicola Pacifica,
W81-00441 5C

Particle Transport from the West African Shelves of Liberia and Sierra Leone to the Deep Sea: A Chemical Approach,
W81-00454 2J

Aspects of Drainage Basin Morphometry of Relevance to Arctic Hydrology,
W81-00459 2J

SEDIMENT YIELD
Sediment Sources and Yields from Upland Watersheds in North Mississippi,
W81-00300 2J

SEDIMENTATION
Process and Apparatus for Maintaining a Desired Depth of a Waterway,
W81-00375 8A

Conservation Impacts and Practices of Sand Removal from Dry Bed Oklahoma Rivers,
W81-00380 2J

SEDIMENTS
The Influence of P-Retention by Soils and Sediments on the Water Quality of the Lions River,
W81-00338 5B

Arsenic Cycling in Marine Systems,
W81-00403 5B

Relationship of Per Cent Mortality of Four Species of Aquatic Biota from 96-Hour Sediment Bioassays of Five Lake Michigan Harbors and Elutriate Chemistry of the Sediments,
W81-00436 5C

Behaviour of 12 Insecticides in Soil and Aqueous Suspensions of Soil and Sediment,
W81-00499 5B

SEEPAGE
Stratified Bidirectional Seepage Flow Through an Earthen Embankment,
W81-00270 2H

SEISMIC STUDIES
Seismic Risk Analysis of Wilmington, Delaware,
W81-00379 8A

SEPARATION TECHNIQUES
Analytical Problem Solving with Verification Samples Interference Reduction Options,
W81-00452 5A

SETTLING BASINS
Hogsmill Valley Sewage Treatment Works,
W81-00252 5D

Old Water System Gets New Life,
W81-00261 5D

SEWAGE BACTERIA
Fate of Coliform Bacteria in the Upper New York Bay,
W81-00324 5A

SEWAGE EFFLUENTS
Fate of Coliform Bacteria in the Upper New York Bay,
W81-00324 5A

The Potential for Nitrogen Fixation in a Lake Receiving Sewage Effluent (Grasmere, English Lake District),
W81-00404 5C

SEWAGE LAGOONS
Microscsreens Polish Lagoon Effluent,
W81-00432 5D

SEWAGE SLUDGE
Make Sewage a Valuable Commodity,
W81-00258 3D

Chemical and Microbiological Impact of Sewage Sludge on Soil Systems,
W81-00275 5D

SEWAGE TREATMENT
EBMUD: Award Winning Sewage Works,
W81-00421 5D

SEWERAGE
Disputes over Water Quality Policy: Professional Cultures in Conflict, 1900-1917,
W81-00407 5F

On-Site Treatment for Low-Density Areas,
W81-00419 5D

SHALLOW WELLS
The Surficial Aquifer at the U.S. Naval Station Near Mayport, Florida,
W81-00349 2F

SHIPS
Shipping in the Baltic,
W81-00448 6E

SIMULATION ANALYSIS
Expanded Floodplain Information Study for the Wolf River Basin, Tennessee and Mississippi: A Computer Simulation,
W81-00305 2E

SLUDGE DISPOSAL
Planned Processing Beats Back Water-Plant Sludge Disposal Problems,
W81-00438 5F

Sewage-Sludge Incineration Raises Air Pollution Concerns,
W81-00442 5E

SLUDGE TREATMENT
Hogsmill Valley Sewage Treatment Works,
W81-00252 5D

Effect of Systems Solids Retention Time (SSRT or Sludge Age) on Nitrogen Removal from Activated-Sludge Systems,
W81-00429 5D

Sludge Treatment Vs. Energy Conservation,
W81-00439 5E

SNALYSES
Content and Distribution Patternof 2, 4-D in the Red River,
W81-00382 5B

SNOWFALL
Spatial Simulation of Snow Processes,
W81-00381 2C

SNOWMELT
Winter Water--The Flooding at Boise, Idaho, January 11-12, 1979,
W81-00364 2E

Spatial Simulation of Snow Processes,
W81-00381 2C

Discussion on Snowmelt,
W81-00464 2C

Hydraulic Aspects of Ice Jamming,
W81-00476 2C

Flood Forecasting in the Saint John River Basin - Mathematical Modelling Activities,
W81-00480 2E

SNOWPACKS
Creep and Glide Processes in Mountain Snowpacks,
W81-00387 2C

SOCIAL IMPACT
Tennessee-Tombigbee Corridor Area: Growth Forecasting and Management,
W81-00294 6B

Income Distribution and Water Resource Projects: Testing the Classical Theory of Economic Development,
W81-00295 6B

A Field Test of Environmental Impact Assessment in the Tensas Basin,
W81-00297 6B

SOCIAL PARTICIPATION
Maximizing the Utilities of Social Criteria for Urban Water Management and Planning,
W81-00264 6B

SOIL AMENDMENTS
Chemical and Microbiological Impact of Sewage Sludge on Soil Systems,
W81-00275 5D

SOIL CHEMISTRY
Chemical and Microbiological Impact of Sewage Sludge on Soil Systems,
W81-00275 5D

SOIL MOISTURE
Importance of Crop Production Functions in Evaluating Consumptive use of Water,
W81-00393 3F

SOIL TEXTURE
Salinity Effects on Hydraulic Properties of Soils,
W81-00415 2G

SOIL TREATMENT
Chemical and Microbiological Impact of Sewage Sludge on Soil Systems,
W81-00275 5D

SOIL TYPES
Influence of Size of Gypsum Particles on the Hydraulic Conductivity of Soils,
W81-00413 2G

SOIL WATER
Forested Wetlands in Eastern Connecticut: Their Transition Zones and Delineation,
W81-00272 2I

SOIL WATER MOVEMENT
An Instrumented Lysimeter System for Monitoring Salt and Water Movement,
W81-00273 2G

Movement of 2,4,5-T Through Large Soil Columns,
W81-00411 5B

SOILS
The Influence of P-Retention by Soils and Sediments on the Water Quality of the Lions River,
W81-00338 5B

Behaviour of 12 Insecticides in Soil and Aqueous Suspensions of Soil and Sediment,
W81-00499 5B

SOLID WASTES
Incineration is a Waste-Management Alternative,
W81-00443 5E

SOLUBILITY
Solubilities of Phenol and Chlorinated Phenols in Supercritical Carbon Dioxide,
W81-00340 5A

SOLVENT EXTRACTIONS
An Evaluation of Factors Affecting the Microextraction of Benzene, Toluene, Ethylbenzene and O-xylene into Pentane,
W81-00453 7B

SOUTH DAKOTA
Five-Year Water Resources Research and Development Goals and Objectives,
W81-00288 9D

SOUTH PLATTE RIVER BASIN (CO)
Hydrologic Data from Upper Grange Hall Creek Basin, Northglenn, Adams County, Colorado,
W81-00366 7C

SPACE-DISTANCE MODEL
Maximizing the Utilities of Social Criteria for Urban Water Management and Planning,
W81-00264 6B

SPATIAL DISTRIBUTION
Spatial Simulation of Snow Processes,
W81-00381 2C

SPECTROMETERS
Direct Determination of Lead in Polluted Sea Water by Carbon-Furnace Atomic Absorption Spectrometry,
W81-00253 5A

SPECTROPHOTOMETRY
Spectrophotometric Determination of Traces of Cobalt in Water after Preconcentration on Reagent-Loaded Polyurethane Foams,
W81-00254 7B

Application of Current Methods for Metals Determination in Wastewaters from the Organics/Plastics Industry,
W81-00450 5A

SPRINKLER IRRIGATION
Self-Correcting Linearly Movable Irrigation System,
W81-00369 3F

Leaching Losses of Two Nutrients and an Herbicide from Two Sandy Soils During Transient Drainage,
W81-00414 5B

ST. LAWRENCE RIVER
Development of an Oil Spill Model for the St. Lawrence River,
W81-00386 5B

STATE GOVERNMENTS
Federal Water Legislation,
W81-00399 6A

STATISTICAL ANALYSIS
Statistical Analysis of Stream Events,
W81-00298 2E

STATISTICAL MODELS
A Flexible Family of Stachastic Models,
W81-00488 2E

STOCHASTIC PROCESSES
A Flexible Family of Stachastic Models,
W81-00488 2E

STONEFLIES
Respiration of Aquatic Insect Larvae (Ephemeroptera, Plecoptera) in Acid Mine Water,
W81-00420 5C

STORM DRAINS
Underground Reservoirs can Control Stormwater Overflows,
W81-00417 5F

STORM RUNOFF
Two Approaches to Identify Storm Water Runoff Loads,
W81-00310 4C

Winter Water--The Flooding at Boise, Idaho, January 11-12, 1979,
W81-00364 2E

Underground Reservoirs can Control Stormwater Overflows,
W81-00417 5F

STORM WATER
Stormwater Management in the United States A Study of Institutional Problems, Solutions and Impacts,
W81-00263 4A

STRATIFICATION
Enhancement of Release Water Quality by Localized Mixing Lake Okatibbee, MS,
W81-00309 2H

Boundary Mixing in Density-Stratifield Fluids,
W81-00390 1A

STREAM
Suspended-Sediment Discharge, in Five Streams Near Harrisburg, Pennsylvania, Before, During, and After Highway Construction,
W81-00361 4C

STREAMFLOW
Statistical Analysis of Stream Events,
W81-00298 2E

The Allocation of Water to Instream Flows, Volume I: A Comparative Study of Policy Making and Technical Information in the States of Colorado, idaho, Montana, and Washington,
W81-00317 6E

The Allocation of Water to Instream Flows, Volume II: Colorado Water Resources Management,
W81-00318 6E

The Allocation of Water to Instream Flows, Volume III: Idaho Water Resources Management,
W81-00319 6E

The Allocation of Water to Instream Flows, Volume IV: Montana Water Resources Management,
W81-00320 6E

The Allocation of Water to Instream Flows, Volume V: Washington Water Resources Management,
W81-00321 6E

A Practical Lagrangian Transport Model,
W81-00360 5B

Hydrologic Data from Upper Grange Hall Creek Basin, Northglenn, Adams County, Colorado,
W81-00366 7C

Conservation Impacts and Practices of Sand Removal from Dry Bed Oklahoma Rivers,

TEXAS
A Five-Year Plan for Water Resources Research for Texas,
W81-00287 6E

THERMAL POLLUTION
Environmental Impact of a Nuclear Plant on Mississippi River Biota in an Ecological Recovery Zone Near Red Wing, Minnesota,
W81-00262 5C

THERMAL WATER
Scale Reduction in Physical Hydraulic Models of Thermal Discharges,
W81-00327 5G

THRESHOLDS
Some Applications of the Concept of Geomorphic Thresholds,
W81-00342 2J

TIME SERIES ANALYSIS
Hydro Configuration Modelling System,
W81-00490 2E

TOMBIGBEE RIVER
Tennessee-Tombigbee Waterway: Planning History,
W81-00291 8A

Tennessee-Tombigbee Waterway Project Design and Construction Activity,
W81-00292 8A

TOXICITY
Secondary Fibres Pulping/Deinking Effluent Toxicity Study,
W81-00388 5C

Mutagenicity in Salmonella of Fluorescent Dye Tablets used in Water Tracing,
W81-00497 5A

TRACE ELEMENTS
Spectrophotometric Determination of Traces of Cobalt in Water after Preconcentration on Reagent-Loaded Polyurethane Foams,
W81-00254 7B

Further Investigations of Alumina-Lime-Soda Water Recovery Applications,
W81-00316 5G

Uptake of Trace Metals by the Clam Macoma Inquinata from Clean and Oil-Contaminated Detritus,
W81-00434 5C

TRACKING TECHNIQUES
Ammonium Input to the Sea Via Large Sewage Outfalls-Part I: Tracing Sewage in Southern California Waters,
W81-00426 5C

Mutagenicity in Salmonella of Fluorescent Dye Tablets used in Water Tracing,
W81-00497 5A

TRANSPORT MODELING
A Practical Lagrangian Transport Model,
W81-00360 5B

TRAP EFFICIENCY
A Field Calibration of the Sediment-Trapping Characteristics of the Helley -Smith Bedload Sampler,
W81-00363 2J

TREATMENT FACILITIES
Hogsmill Valley Sewage Treatment Works,
W81-00252 5D

Zero Discharge: It Wasn't a Costly Pipedream for One Waterworks,
W81-00257 5D

Old Water System Gets New Life,
W81-00261 5D

TRIAZINE PESTICIDES
Identification and Confirmation of Atrazine in Pond Water,
W81-00412 5A

TRITIUM
Movement of 2,4,5-T Through Large Soil Columns,
W81-00411 5B

TURBULENCE
Boundary Mixing in Density-Stratifield Fluids,
W81-00390 1A

ULTRAVIOLET RADIATION
Removal of Organics in Water Using Hydrogen Peroxide in Presence of Ultraviolet Light,
W81-00498 5F

UNCONSOLIDATED AQUIFERS
The Surficial Aquifer at the U.S. Naval Station Near Mayport, Florida,
W81-00349 2F

UNDERGROUND STORAGE
Use of Bounding Wells to Negate the Effects of Gravity and Pre-Existing Groundwater Movement in Dipping Aquifers Used for Storage,
W81-00312 4D

UNIVERSITIES
Water Resources Research Support Program 1979-1980,
W81-00383 6E

UNSATURATED FLOW
Particular Solutions to the Problem of Horizontal Flow of Water and Air Through Porous Media Near a Wetting Front,
W81-00496 7B

UNSTEADY FLOW
Channel and Dynamic Flow Characteristics of the Chattahoochee River, Buford Dam to Georgia Highway 141,
W81-00362 8B

UPPER YAZOO PROJECTS
Analyses of Water, Bank Material, Bottom Material, and Elutriate Samples Collected Near Belzoni, Mississippi (Upper Yazoo Projects),
W81-00355 1B

URBAN DRAINAGE
Stormwater Management in the United States A Study of Institutional Problems, Solutions and Impacts,
W81-00263 4A

URBAN RUNOFF
Two Approaches to Identify Storm Water Runoff Loads,
W81-00310 4C

Five Year Research and Development Plan for the Rhode Island Water Resources Center,
W81-00334 6E

VEGETATION
Forested Wetlands in Eastern Connecticut: Their Transition Zones and Delineation,
W81-00272 2I

VELOCITY
Creep and Glide Processes in Mountain Snowpacks,
W81-00387 2C

VERMONT
Vermont Water Resources Research Center Five-Year Plan for Water Resources Research and Development,
W81-00283 6E

VERTICAL MIGRATION
Boundary Mixing in Density-Stratifield Fluids,
W81-00390 1A

VICKSBURG (MS)
Variations of a Mississippi River Crossing with Stage,
W81-00304 2E

VIRUSES
The Mechanism of Ozone Inactivation of Waterborne Viruses,
W81-00315 5F

WABASH RIVER (IN)
A One-Dimensional, Steady-State, Dissolved-Oxygen Model and Waste-Load Assimilation Study for the Wabash River, Huntington County, Indiana,
W81-00354 5B

WARNING SYSTEMS
Meteorological Inputs for Hydrological Models,
W81-00477 2E

WASHINGTON
Lake Sammamish Response to Wastewater Fiversion and Increasing Urban Runoff,
W81-00274 2H

The Allocation of Water to Instream Flows, Volume I: A Comparative Study of Policy Making and Technical Information in the States of Colorado, idaho, Montana, and Washington,
W81-00317 6E

The Allocation of Water to Instream Flows, Volume V: Washington Water Resources Management,
W81-00321 6E

WASTE ASSIMILATIVE CAPACITY
A One-Dimensional, Steady-State, Dissolved-Oxygen Model and Waste-Load Assimilation Study for the Wabash River, Huntington County, Indiana,
W81-00354 5B

WASTE DISPOSAL
The Collection, Treatment, and Disposal of Farm Wastes,
W81-00251 5D

Leachate Control Doesn't Come Easy,
W81-00423 5D

Incineration is a Waste-Management Alternative,
W81-00443 5E

Microbiology of a Pesticide Disposal Pit,
W81-00455 5E

WASTE TREATMENT
On-Site Treatment for Low-Density Areas,
W81-00419 5D

WASTE WATER (POLLUTION)
Impact of Iron Discharges from Wastewater Treatment Plants on Algal Growth and Species Composition,
W81-00265 5C

Analytical Problem Solving with Verification Samples Interference Reduction Options,
W81-00452 5A

WASTE WATER TREATMENT
Removal of Eutrophic Nutrients from Wastewater and Their Bioconversion to Bacterial Single Cell Protein for Animal Feed Supplements: Phase I,
W81-00276 5D

The Mechanism of Ozone Inactivation of Waterborne Viruses,
W81-00315 5F

Control of Pollution in Waters Containing Heavy Metals,
W81-00323 5G

Gas Treatment of Liquid,
W81-00372 5D

Waste Water Treatment,
W81-00374 5D

Biological Treatment and Toxicity Studies,
W81-00389 5D

Underground Reservoirs can Control Stormwater Overflows,
W81-00417 5F

The Effects of Nitrate Concentration and Retention Period on Biological Denitrification in the Rotating-Disc System,
W81-00428 5D

Effect of Systems Solids Retention Time (SSRT or Sludge Age) on Nitrogen Removal from Activated-Sludge Systems,
W81-00429 5D

Microscsreens Polish Lagoon Effluent,
W81-00432 5D

Bacterial Die-Off and Stream Transport Studies,
W81-00492 5D

Characteristics of Gel Chromatography Using Sephadex Gel for Fractionation of Soluble Organic Pollutants,
W81-00493 7B

WASTEWATER REUSE
Water Conservation Alternatives for the North,
W81-00384 3D

WASTEWATER TREATMENT
Removal of Eutrophic Nutrients from Wastewater and Their Bioconversion to Bacterial Single Cell Protein for Animal Feed Supplements: Phase II,
W81-00277 5D

Removal of Eutrophic Nutrients from Wastewater and Their Bioconversion to Bacterial Single Cell Protein for Animal Feed Supplements: Phase III,
W81-00278 5D

WATER ALLOCATION (POLICY)
A 1982-87 Research Program for the University of Illinois Water Resources Center,
W81-00281 6E

The Allocation of Water to Instream Flows, Volume I: A Comparative Study of Policy Making and Technical Information in the States of Colorado, idaho, Montana, and Washington,
W81-00317 6E

The Allocation of Water to Instream Flows, Volume II: Colorado Water Resources Management,
W81-00318 6E

The Allocation of Water to Instream Flows, Volume III: Idaho Water Resources Management,
W81-00319 6E

The Allocation of Water to Instream Flows, Volume IV: Montana Water Resources Management,
W81-00320 6E

The Allocation of Water to Instream Flows, Volume V: Washington Water Resources Management,
W81-00321 6E

WATER ANALYSIS
Spectrophotometric Determination of Traces of Cobalt in Water after Preconcentration on Reagent-Loaded Polyurethane Foams,
W81-00254 7B

Analyses of Water, Bank Material, Bottom Material, and Elutriate Samples Collected Near Belzoni, Mississippi (Upper Yazoo Projects),
W81-00355 1B

Application of Current Methods for Metals Determination in Wastewaters from the Organics/Plastics Industry,
W81-00450 5A

WATER CHEMISTRY
Further Investigations of Alumina-Lime-Soda Water Recovery Applications,
W81-00316 5G

A Biologist's View on the Role of Water Chemistry in Environmental Assessment,
W81-00462 1A

WATER CONSERVATION
Use of Bounding Wells to Negate the Effects of Gravity and Pre-Existing Groundwater Movement in Dipping Aquifers Used for Storage,
W81-00312 4D

A Five-Year Plan for Water Resources Research and Associated Technology Transfer Needs,
W81-00330 6E

Five Year Research Plan, 1982-1987,
W81-00332 6E

Water Conservation Alternatives for the North,
W81-00384 3D

WATER COOLING
Scale Reduction in Physical Hydraulic Models of Thermal Discharges,
W81-00327 5G

WATER DEMAND
Estimating Irrigation Water Quantity and Quality,
W81-00271 6D

WATER LAW
The Allocation of Water to Instream Flows, Volume II: Colorado Water Resources Management,
W81-00318 6E

The Allocation of Water to Instream Flows, Volume III: Idaho Water Resources Management,
W81-00319 6E

The Allocation of Water to Instream Flows, Volume IV: Montana Water Resources Management,
W81-00320 6E

The Allocation of Water to Instream Flows, Volume V: Washington Water Resources Management,
W81-00321 6E

A Historical Perspective of Water Management in New Mexico,
W81-00392 6E

WATER LEVELS
Water Levels in Artesian and Nonartesian Aquifers of Florida, 1977-78,
W81-00346 2F

Surge Tank Water Level Variations Following Rapid Valve Opening,
W81-00409 7B

WATER LOSS
Use of Bounding Wells to Negate the Effects of Gravity and Pre-Existing Groundwater Movement in Dipping Aquifers Used for Storage,
W81-00312 4D

WATER MANAGEMENT (APPLIED)
A Five-Year Plan for Water Resources Research for Texas,
W81-00287 6E

The Allocation of Water to Instream Flows, Volume II: Colorado Water Resources Management,
W81-00318 6E

The Allocation of Water to Instream Flows, Volume III: Idaho Water Resources Management,
W81-00319 6E

The Allocation of Water to Instream Flows, Volume IV: Montana Water Resources Management,
W81-00320 6E

The Allocation of Water to Instream Flows, Volume V: Washington Water Resources Management,
W81-00321 6E

Water Resources Research Five-Year Plan/ 1982-1987,
W81-00331 6E

Five-Year Plan of the Puerto Rico Water Resources Research Institute,
W81-00336 6E

Nebraska Water Resources Center Five-Year Water Resources Research Program, 1982-1987,
W81-00337 6E

A Historical Perspective of Water Management in New Mexico,
W81-00392 6E

Water Resources of the Rio Grande An Interdisciplinary Approach,
W81-00394 6A

WATER POLICY
Federal Water Legislation,
W81-00399 6A

WATER POLLUTION
Debris Separation and Disposal System,
W81-00371 5G

Content and Distribution Patternof 2, 4-D in the Red River,
W81-00382 5B

Development of an Oil Spill Model for the St. Lawrence River,
W81-00386 5B

WATER POLLUTION CONTROL
Time for a New Clean Water Program,
W81-00260 6E

Control of Pollution in Waters Containing Heavy Metals,
W81-00323 5G

Leachate Control Doesn't Come Easy,
W81-00423 5D

Shipping in the Baltic,
W81-00448 6E

WATER POLLUTION EFFECTS
Effects of Water-Borne Mirex on the Survival and Production of Macrobrachium Rosenbergii (De Man),
W81-00326 5C

WATER POLLUTION SOURCES
Lake Sammamish Response to Wastewater Fiversion and Increasing Urban Runoff,
W81-00274 2H

Control of Pollution in Waters Containing Heavy Metals,
W81-00323 5G

Water Quality Degredation Due to Non-Point Pollution from Urban Sources,
W81-00339 5B

Estimated Application of Gas Chromatographic Headspace Analysis to Priority Pollutants,
W81-00447 7B

WATER POLLUTION TREATMENT
Debris Separation and Disposal System,
W81-00371 5G

Gas Treatment of Liquid,
W81-00372 5D

Waste Water Treatment,
W81-00374 5D

WATER PROPERTIES
Reaeration Tests, Enid Lake Outlet Works,
W81-00308 8B

WATER PURIFICATION
Further Investigations of Alumina-Lime-Soda Water Recovery Applications,
W81-00316 5G

Apparatus for Controlled Chlorination of Water with an Alkali Metal Dichloroisocyanurate,
W81-00376 5F

Removal of Organics in Water Using Hydrogen Peroxide in Presence of Ultraviolet Light,
W81-00498 5F

WATER QUALITY
North Carolina's Five-Year Water Research Program for 1982-1987,
W81-00280 6E

Five-Year Water Resources Research Program,
W81-00285 6E

Five-Year Water Resources Research and Development Goals and Objectives,
W81-00286 6E

A Remote Monitoring System for Water Quality Parameters,
W81-00307 7B

Enhancement of Release Water Quality by Localized Mixing Lake Okatibbee, MS,
W81-00309 2H

Five Year Research Plan, 1982-1987,
W81-00332 6E

The Influence of P-Retention by Soils and Sediments on the Water Quality of the Lions River,
W81-00338 5B

Water Resources Data for Maine, Water Year 1979,
W81-00343 7C

Water Resources Data for Georgia, Water Year 1979,
W81-00344 7C

Water Resources Data for New Jersey, Water Year 1979--Volume 1. Atlantic Slope Basins, Hudson River to Cape May,
W81-00347 7C

Water Resources Data for New Jersey, Water Year 1979--Volume 2. Delaware River Basin and Tributaries to Delaware Bay,
W81-00348 7C

The Surficial Aquifer at the U.S. Naval Station Near Mayport, Florida,
W81-00349 2F

Evaluation of a Cavity-Riddled Zone of the Shallow Aquifer Near Riviera Beach, Palm Beach County, Florida,
W81-00351 4B

A One-Dimensional, Steady-State, Dissolved-Oxygen Model and Waste-Load Assimilation Study for the Wabash River, Huntington County, Indiana,
W81-00354 5B

Analyses of Water, Bank Material, Bottom Material, and Elutriate Samples Collected Near Belzoni, Mississippi (Upper Yazoo Projects),
W81-00355 1B

The Impact of Desalting on Water Supply - Alamogordo, New Mexico,
W81-00400 5F

WATER QUALITY STANDARDS
Approach to Quality Assurance/Quality Control in the Organic Chemicals Industry Monitoring Program,
W81-00451 7B

WATER QUANTITY
North Carolina's Five-Year Water Research Program for 1982-1987,
W81-00280 6E

Five-Year Water Resources Research Program,
W81-00285 6E

WATER RESOURCES
Indiana Five-Year Water Resources Research and Development Plan, Fiscal Years 1982-1986,
W81-00279 6E

Vermont Water Resources Research Center Five-Year Plan for Water Resources Research and Development,
W81-00283 6E

Water Resources Research Support Program 1979-1980,
W81-00383 6E

SELECTED WATER RESOURCES ABSTRACTS

VOLUME 14, NUMBERS 3 & 4
FEBRUARY 15, 1981

W81-00501 -- W81-00750
CODEN: SWRABW

SELECTED WATER RESOURCES ABSTRACTS (SWRA) is produced by the Office of Water Research and Technology, U.S. Department of the Interior, and published twice monthly by the National Technical Information Service (NTIS), U.S. Department of Commerce.

SWRA is available to Federal agencies and their contractors or grantees in water resources research upon request, citing contract or grant number and sponsoring agency. Write: Office of Water Research and Technology, U.S. Department of the Interior, Washington, DC 20240. The **SWRA Journal** is also available on subscription from NTIS, 5285 Port Royal Road, Springfield, VA 22161. Annual subscription rates for the North American Continent are: Journal only, $100; Journal and Annual Indexes, $125; Indexes only, $50.Other addressees, write for prices.

Some documents abstracted in this journal can be purchased from NTIS. Price codes are given in the entries and a current code-price conversion table is printed on the outside back cover. Other documents are available from originating organizations or authors as indicated in the citation.

Notice to Subscribers

The input system within the Office of Water Research and Technology, U.S. Department of the Interior, is undergoing transition. This action has temporarily reduced the number of reports available for announcement.

Volume 14, Numbers 3 and 4 are combined in this issue. Some future issues may also be combined until normal input flow is resumed.

SELECTED WATER RESOURCES ABSTRACTS

A semimonthly publication of the Office of Water Research and Technology,
U.S. Department of the Interior

VOLUME 14, NUMBERS 3 & 4
FEBRUARY 15, 1981

W81-00501 -- W81-00750

The Secretary of the Interior has determined that the publication of the periodical is necessary in the transaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1983.

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

PREFACE

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. These documents cover water resources as treated in the life, physical, and social sciences and the related engineering and legal aspects of the characteristics, supply condition, conservation, control, use, or management of water resources. Each abstract includes a full bibliographic citation and a set of descriptors which are listed in the **Water Resources Thesaurus.** The abstract entries are classified into 10 fields and 60 groups similar to the water resources research categories established by the Committee on Water Resources Research of the then Federal Council for Science and Technology.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several services of the Office of Water Research and Technology. The cumlative SWRA file from 1968 and monthly updates are available also in magnetic tape through lease from NTIS.

THE OFFICE OF WATER RESEARCH AND TECHNOLOGY DOES NOT PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Comments and suggestions concerning the contents and arrangement of this bulletin are welcome.

CONTENTS

SUBJECT FIELDS AND GROUPS

Please use the edge index on the back cover to locate Subject Fields and Indexes.

01 NATURE OF WATER

Includes the following Groups: Properties; Aqueous Solutions and Suspensions.

02 WATER CYCLE

Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION

Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL

Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Nonwater Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION

Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING

Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA

Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS

Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES

Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION

Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

2D. Evaporation and Transpiration

BATHYMETRIC STUDIES ON THE PONGOLO RIVER FLOOD PLAIN,
Natal Univ., Pietermaritzburg, (South Africa).
C. M. Breen, H. D. Furness, J. Heeg, and J. Kok.
Journal of the Limnological Society of Southern Africa (Bloemfontein), Vol 4, No 2, p 95-100, 1978, 5 Fig, 4 Tab, 15 Ref.

Descriptors: *Standing waters, *Flood plains, *Evaporation, *Surveys, *Bathymetry, *Limnology, *Fish farming, Rivers, Surface waters, Lake morphology, Sediments, Thermocline, Water levels, Vegetation, Thermal properties, Ecology, Maps, Sampling, Water loss, Drying, Seasonal, Rainfall, Flood frequency, Flood peak, Fish populations, Sounding, South Africa.

The morphology and ecological characteristics of thirteen of the major pans on the Pongolo River, South Africa, were surveyed and the suitability of various pans for fish production was assessed. During high flood levels (HFL) related to allochthonous inputs, the pans or floodplain basins fill with water and most of the pans retain what has been classified as a maximum retention level (MRL) of water throughout the dry season. Floods inundate about 1000 hectares around the pans. Most of the pans are shallow, less than 2.5 meters deep, yet most of them do not dry out. Depth soundings of the pans were made from an open boat and transferred to 1:600 trignometric survey maps. The floodplain is located in an area where rainfall is seasonal and the evaporative demand is high. Water levels are therefore flood dependent and drop below MRL in the dry season, exposing Cynodon dactyeon which can be used for grazing. Pans with a large volume and shallow depth would be suitable for fish production. (Sidney-IPA)

2E. Streamflow and Runoff

A BASEFLOW SIMULATION MODEL,
Colorado State Univ., Fort Collins. Dept. of Earth Resources.
S. E. Hogg, A. G. Thompson, and W. D. Striffler.
In: Proceedings, Watershed Management Symposium. Boise, Idaho, July 21-23, 1980, Vol II, p 755-763, (1980). American Society of Civil Engineers, 345 E. 47th St. New York, NY 10017. OWRT-B-160-Colo(6).

Descriptors: *Base flow, *Model studies, *Streamflow, *Subsurface flow, Simulation analysis, Surface-groundwater relationships, Hydrographs, Watersheds(Basins), Colorado, Rocky Mountains.

A model is presented in which streamflow is simulated at selected arbitrary points along the stream channel. The area of watershed contributing to streamflow between any two points along the channel is defined as a hydrologic response unit. A parameter deck is automatically generated from digital terrain models containing information on topography, vegetation, soils and response unit boundaries. Streamflow contibution is then simulated for each response unit in the watershed. Streamflow is generated according to the dynamic contributing area concept of runoff, incorporating lateral subsurface flow in the channel. The emphasis of the model is on generation of baseflow from groundwater and lateral subsurface flow in the soil. Hydrographs are shown for streamflow in the Williams Fork watershed, near Parshall, Colorado at various points along the channel, as well as for the entire watershed. The model was initially developed for watersheds in the Colorado Rockies but is to be extended elsewhere.
W81-00516

ECOLOGICAL COMPARISON OF INTERMITTENT STREAMS IN DIFFERENT LAND USE PATTERNS IN NORTHEASTERN ILLINOIS,
Louisville Univ., KY. Systems Science Centre.
W. J. Mitsch, and D. A. Urbikas.
University of Louisville, Illinois Institute of Natural Resources, Chicago, Document No 80/17, September 1980. 154 p, 28 Fig, 24 Tab, 65 Ref.

Descriptors: *Illinois, *Intermittent streams, *Watershed management, *Land use, Effects, Streamflow, *Ecosystems, Benthic flora, Benthic fauna, Food chains, Invertebrates, Forecasting, Tubidity, Low-flow frequency.

An assessment of the contribution of intermittent streams is needed since these streams may have a profound effect on the downstream community and the ecology of the larger watershed. Five types of land-use watersheds were chosen: agricultural, residential, industrial, urban/commercial, and forested. The major characteristics of the five streams are presented under physical, chemical and biological headings. Streamflow is the most important physical characteristic; its quantitative value is a direct result of precipitation and soil infiltration. During the 5-month sampling period, water samples, flow measurements and benthic invertebrate samples were taken. Relationships between the benthic invertebrate community and time, streamflow, velocity, stream depth, dissolved oxygen, temperature and turbidity are discussed. The study concludes that a total watershed approach must be involved, including seemingly insignificant intermittent streams, in the study of larger stream systems. Any man-made alterations in flow patterns for these streams must be viewed with this downstream effect in mind as well as the immediate effect on the intermittent stream itself. Small ecosystems cannot tolerate sudden changes, while gradual, cumulative changes can be somewhat unobtrusively passed on to the downstream ecosystem. These effects, however, are often not realized until much damage has already occurred. Preliminary stream energy models were developed from the data and allow for some predictive capacity to prevent irreversible detrimental effects. (Atkins-Omniplan)
W81-00645

ANALYSIS OF STREAM QUALITY IN THE YAMPA RIVER BASIN, COLORADO AND WYOMING,
Geological Survey, Lakewood, CO. Water Resources Div.
For primary bibliographic entry see Field 5B.
W81-00660

LOW-FLOW CHARACTERISTICS OF LOUISIANA STREAMS,
Geological Survey, Baton Rouge, LA. Water Resources Div.
M. J. Forbes, Jr.
Louisiana Department of Transportation and Development, Office of Public Works Water Resources Technical Report No 22, 1980. 95 p, 2 Fig, 1 Plate, 4 Tab, 9 Ref.

Descriptors: *Low flow, *Flow characteristics, *Streamflow, *Louisiana, Gaging stations, Flow measurement, Statistics, Frequency analysis, Correlation analysis, Low-flow frequency, Flow rates, Hydrologic data, Log Pearson type III distribution, Climatic year, Continuous-record stations, Partial-record stations.

This report presents annual and monthly statistics of low flow for 114 streamflow stations in Louisiana for which continuous records of discharge are available and annual statistics for 245 stations (partial record) at which intermittent measurements of low flow have been made. Independent calculations of statistics for continuous-record stations were made using the log-Pearson type III distribution. Statistics for partial-record stations were determined by a regression of discharges at those stations with discharges at continuous-record stations. (USGS)
W81-00665

EVALUATION OF SELECTED DAM-BREAK FLOOD-WAVE MODELS BY USING FIELD DATA,
Geological Survey, NSTL Station, MS. Water Resources Div.
L. F. Land.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-115776, Price codes: A04 in paper copy, A01 in microfiche. Geological Survey Water-Resources Investigations 80-44, July 1980. 54 p, 14 Fig, 6 Tab, 19 Ref.

Descriptors: *Floods, *Dam failure, *Model studies, *Mathematical models, Evaluation, Flood forecasting, Flood discharge, Peak discharge, Hydraulic properties, Hydrodynamis, Continuity equation,Momentum equation, Flood routing, *Teton Dam(ID), *Johnstown(PA), *Tocca Falls(GA).

Four dam-break flood-wave models have been evaluated by using three field data sets and selected criteria of desirable features. The models include (1) modified Puls (MP), (2) U.S. Army Corps of Engineers' unsteady flow profiles (USTFLO), (3) National Weather Services' dam-break flood forecast (DBFF), and (4) U.S. Geological Survey's coupled method of characteristics and a general purpose streamflow simulation (M0D-J879DB). The field data sets documented the disasters at Teton Dam, Idaho, Laurel Run, Pa., and Toccoa Falls, Ga. The computed discharges were often within 20% of the observed values with the exception of the simulations at Teton Dam and for a short distance below the dams by the M0C-J879DB. With the same exceptions noted above, the computed flood crests were usually within 2 feet of the observed high-water marks. A modified version of the DBFF model is identified as giving the best results. Overall, it was the most accurate, economical, flexible, numerically stable, easiest to apply, and descriptive of the boundary and flow conditions. (USGS)
W81-00666

FLOOD MAGNITUDE AND FREQUENCY OF STREAMS IN INDIANA: PRELIMINARY ESTIMATING EQUATIONS,
Geological Survey, Indianapolis, IN. Water Resources Div.
R. L. Gold.
Available from the OFSS, USGS Box 25425, Fed. Ctr. Denver CO 80225, $6.00 in paper copy, $3.50 in microfiche. Geological Survey Open-File Report 80-759, July, 1980. 44 p, 2 Fig, 2 Tab, 5 Ref.

Descriptors: *Floods, *Flood frequency, *Streams, *Indiana, Illinois, Estimating equations, Regression analysis, Peak discharge, Flood peak, Streamflow, Gaging stations, Sites, Flood recurrence interval, Basin characteristics.

This interim report presents preliminary estimating equations developed for the ongoing study, 'Flood Frequency of Small Streams in Indiana.' The equations were developed by the multiple-regression technique from data collected at 57 crest-stage-gage and 15 rainfall-runoff sites in the study and from 133 streamflow stations in Indiana and 11 in eastern Illinois. Peak discharge was used as the dependent variable, and basin characteristics were used as the independent variables in the analysis. Drainage area and precipitation were the most significant basin characteristics. (USGS)

W81-00667

PREDICTING NORMAL MIMIMUM-FLOW RATES FOR UNGAGED STREAMS IN WEST VIRGINIA,
West Virginia Univ., Morgantown. Water Research Inst.
R. Lee, H. W. Rauch, D. G. Boyer, and E. Snyder.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-138000, Price codes: A04 in paper copy, A01 in microfiche. Technical Completion Report, 1980. 73 p, 1 Fig, 17 Tab, 67 Ref. OWRT-A-038-WVA(1), 14-34-0001-9052.

Descriptors: *Base flow, Gaging, *Low flow, Low-flow frequency, Mathematical models, Statistical models, *Streamflow forecasting, Climatology, Frequency analysis, Geologic control, Geomorphology, Statistical methods, Synthetic hydrology, Topography, Watersheds(Basins), *West Virginia, *Ungaged Streams.

Comprehensive analyses of a wide range of watershed characteristics were conducted in order to develop deterministic relationships and statistical models for predicting normal minimum flow rates in ungaged West Virginia streams. Preliminary studies demonstrated that the widely used Q7-10 parameter is inherently unstable; its variability for 25-year intervals within a 50-year period of record was about 30% (plus or minus 15%). Water balance computations were significantly improved by the revision of the isohyetal map of normal annual precipitation, and it was shown that derived relationships for normal annual discharge, seasonal flow recession, and seasonal storage fluctuations could be obtained from easily available data. Statistical models incorporating basin area, normal annual discharge, and a seasonal recession constant were effective in estimating Q7-10 with an accuracy as great as the consistency of the variable itself. Of the geologic variables tested, area of carbonate rock was most highly correlated with low-flow parameters (Q7-10 and Q7-2); in eastern West Virginia, carbonate rock exposure is highly correlated with the seasonal recession constant, and may be used interchangeably for low-flow predictions.
W81-00685

MEASUREMENT OF WATER FLOW RATE,
Department of Agriculture, Washington, DC. Office of the Secretary. (Assignee).
J. A. Replogle, A. J. Clemmens, and E. D. Bell.
U.S. Patent No 4,195,519, 6 p, 3 Fig, 13 Ref; Official Gazette of the United States Patent Office, Vol 993, No 1, p 60, April 1, 1980.

Descriptors: *Patents, *Channel flow, *Flow measurement, Flow rates, Water level, Flow control, Equipment.

Water flow rate in channelized, flowing bodies of water is measured by first obstructing the flow of water in the body causing a rise in the water surface upstream from the obstruction. This rise in upstream water surface is communicated to a point above the obstruction and measured there. The measurement is then converted to a water flow rate. A device for measuring water flow rate includes means for producing an obstruction in water flow in the body of water thus causing a rise in the water surface upstream from the obstruction, means for communicating the rise in upstream water surface to a point above the obstruction, and means for measuring the rise at that point, all secured to a frame. (Sinha - OEIS)
W81-00714

2F. Groundwater

ENVIROMENTAL CONTROLS ON OCCURRENCE AND CHEMISTRY OF GROUNDWATER IN A CARBONATE TERRANE OF EASTERN NEVADA,
Fugro, Inc., Long Beach, CA.
C. A. Johnson.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-131112, Price codes: A06 in paper copy, A01 in microfiche. Water Resources Center, University of Nevada, Reno, Publication No 41066, 1980. 101 p, 16 Fig, 6 Tab, 43 Ref, 3 Append. OWRT-B-045-NEV(1), 14-31-0001-3303.

Descriptors: *Groundwater movement, *Groundwater sources, *Geochemistry, *Springs, *Carbonate rocks, Aquifer characteristics, Water quality, Water supply, Arid lands, Groundwater recharge, Snowmelt, Discharge(Water), *Nevada.

Definition of carbonate aquifer characteristics in arid regions is important to a better understanding of water supply sources in Nevada. A description is provided of the identification and interpretation of environmental factors which influence the quantity and chemistry of groundwaters discharging from carbonate terrane in eastern Nevada. Primary controls are geologic structure, mineralogy and physical properties of rocks, and climate. Springs which demonstrate a seasonal cyclic variation in discharge but relatively constant chemistry drain a large-scale area-wide flow system. Amount of snowfall, seasonal temperature, and mineralogy of rocks are most infuluential on solution activity of groundwater, and ultimate chemical quality and discharge of spring waters. (Schulke-Nev)
W81-00637

RESULTS OF COMPUTER MODELING OF GROUNDWATER FLOW - THE CALCIUM CARBONATE AQUIFER OF THE CENTRAL ROSWELL BASIN,
New Mexico Inst. of Mining and Technology, Socorro.
K. R. Rehfeldt.
In: A Quarter Century of Water Research, Proceedings of the Twenty-Fifth Annual New Mexico Water Conference, Apr. 24-25, 1980. WRRI Report No 124, Aug. 1980. p 78-104, 9 Fig, 16 Ref. New Mexico Water Resources Research Institute, New Mexico State University, Box 3167, Las Cruces, NM 88003.

Descriptors: *New Mexico, *Groundwater movement, *Calcium carbonate, *Model studies, Simulation analysis, Transmissivity, Storage coefficient, *Aquifers, Recharge, Infiltration, Precipitation intensity, Tritium, Water distribution, Computer models, Water table.

The flow of groundwater in the Roswell Artesian Basin has been studied since the early 1900's with varied ideas proposed to explain different aspects of the ground-water flow system. The distribution and sources of recharge to the Roswell Basin are delineated using a computer model to simulate groundwater flow in the carbonate aquifer beneath and west of Roswell and in the Glorieta Sandstone and Yeso Formation west of the carbonate aquifer. The effect of precipitation was shown to be small (20%) with deep flow---particularly from the Glorieta Sandstone---appearing to be the major component of recharge. Model parameters include transmissivity, storage coefficient., interaquifer leakage, and recharge. The computer model chosen was a two-dimensional finite-difference model written by Trescott, Pinder and Larson. (Garrison-Omniplan)

AQUIFER TESTS OF THE NAVAJO SANDSTONE NEAR CAINEVILLE, WAYNE COUNTY, UTAH,
Geological Survey, Salt Lake City, UT. Water Resources Div.
J. W. Hood, and T. W. Danielson.
Utah Department of Natural Resources Technical Publication No 66, 1979. 69 p, 18 Fig, 11 Tab, 18 Ref.

Descriptors: *Aquifer testing, Groundwater, *Hydrogeology, *Geohydrologic units, *Aquifer characteristics, Isotropy, Leakage, Hydraulic conductivity, Transmissivity, Storage coefficient, Specific yield, Chemical analysis, Logging(Recording), Hydrologic data, Utah, *Navajo Sandstone, *Wayne County(UT), *Dirty Devil River basin(UT).

The Navajo Sandstone near Cainesville in Wayne County, Utah, is the major aquifer in a section of Mesozoic and Paleozoic sedimentary rocks that is at least 7,160 feet thick. Water in the sandstone is under high artesian pressure. Of two partially penetrating test wells, one yielded 2,800 and the other, 3,110 gallons per minute. The Navajo Sanstone is massive, crossbedded, very fine to fine grained, and approximately 900 ft thick. For the practical purpose, of aquifer analysis, it is hydraulically isotropic in unfractured parts. The average hydraulic conductivity is 0.5 foot per day, and the inferred transmissivity is 450 feet squared per day. Folding has fractured some of the sandstone. The result is enhanced permeability, gross anisotropy of the sandstone, and upward leakage of saline water from underlying formations. Discharging-well tests yield values for transmissivity between 1,330 and 4,250 feet squared per day. Generalized values for transmissivity and storage coefficient that were selected for calculation of long-term pumping effects are 1,500 feet squared per day and 0.001. The specific yield is estimated to be between 5 and 10%. (USGS)

RECORDS OF GROUND-WATER RECHARGE AND DISCHARGE, 1934-78; WATER LEVELS, 1975-78; AND CHEMICAL QUALITY OF WATER, 1977-78, FOR THE EDWARDS AQUIFER IN THE SAN ANTONIO AREA, TEXAS.
Geological Survey, San Antonio, TX. Water Resources Div.
Edwards Underground Water District Bulletin 38, July, 1980. 53 p, 4 Fig, 7 Tab, 71 Ref. (Reeves, R. D., Maclay, R. W., Grimm, K. C., and Davis, M. F., compilers).

Descriptors: *Groundwater recharge, *Water yield, *Water level fluctuations, *Water quality, *Aquifers, Water storage, Precipitation(Atmospheric), Drainage area, Observation wells, Data collections, Sites, Water analysis, Hydrogeology, Maps, Texas, *Edwards aquifer(TX), *San Antonio area(TX).

The average annual ground-water recharge to the Edwards aquifer in the San Antonio area, Texas, from 1934 through 1978 was 587,200 acre-feet. The recharge in 1978 was 502,500 acre-feet, ending a trend of above average recharge that began in 1968. A maximum annual recharge of 1,711,200

acre-feet occurred in 1958, and a minimum annual recharge of 43,700 acre-feet occurred in 1956. A maximum annual discharge of 960,900 acre-feet occurred in 1977, and a minimum annual discharge of 388,800 acre-feet occurred in 1955. The maximum annual discharge by wells was 431,800 acre-feet in 1978, which is a record high for the 1934-78 period. Although water levels in wells in the Edwards aquifer showed a general decline in 1978, the volume of ground water in storage in the aquifer was above average. Analyses of water samples from 72 wells and 3 springs show no evidence of significant degradation of water quality in the Edwards aquifer, and the data show no trend of degradation in water quality. THE INFLUENCE OF RIVER WATER QUALITY ON STORAGE RESERVOIR MANAGEMENT,
California Univ., Berkeley.
H. B. Fischer.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-128688, Price codes: A02 in paper copy, A01 in microfiche. Technical Completion Report, August 1980. 9 p. 8 Ref. W-525.

Descriptors: *Reservoirs, *Surface waters, *Epilimnion, *Hypolimniom, *Rivers, Winds, Meteorology, Water quality, Turbulence, Mixing, Temperature.

Summary of work conducted from June 1977 to June 1980 on numerical modelling used to predict water quality in small- and medium-sized reservoirs. Three aspects of the fluid mechanics of constituent transport to these sized reservoirs are examined in this basic research project: (1) deepening of the epilimnion caused by Kelvin-Helmholtz billowing (Spigel's thesis); (2) mixing in the hypolimnion caused by sidewall turbulence (Ivey's theses); and (3) the effect of unsteady surface winds (Monismith's thesis). The results of part 1 have already been incorporated into the general model, DYRESM; part 2 has just been completed but not yet incorporated into DYRESM; and part 3 is still underway. Descriptors: *Lakes, *Washington, *Water pollution treatment, *Water pollution effects, *Sewage treatment, *Water quality, Pacific coasts region, Water Resources Research Act, Sewage effluents, Water pollution, Pollutants, Ecosystems, Water quality control, Water purification, Natural resources, Water pollution control, Eutrophication, Lake stages.

Washington freshwater lakes had earlier been receiving nutrients and other pollutants that threatened their pristine conditon and has placed several lakes on the verge of eutrophication. Significant developments have since occurred that have enabled significant progress in rehabilitating Washington freshwater lakes. Research studies had involved Liberty Lake, Laker Coeur d' Alene, Lake Washington, Lake Sammamish, Moses Lake, Long Lake, and Newman and Williams Lakes. Lake research is continuing. Sewers and sewage-treatment plants are being constructed to intercept nutrients and other pollutants which formerly entered the lakes unchecked. This document covered separate reports on each of the major Washington lakes. A bibliography of the resulting technical literature has been provided following the discussion of each lake project. Revival of ecological health in Washington lakes has been made possible by the 1964 Water Resources Research Act, Federal and State support of research projects, and increased university student interest and involvement. Specific remedies used to improve lake water quality and ecology were covered. (Zielinski-IPA)

A LIMNOLOGICAL INVESTIGATION OF LAKE LIAMBEZI, CAPRIVI,
National Inst. for Water Research, Pretoria (South Africa).
M. T. Seaman, W. E. Scott, R. D. Walmsley, B. C. W. van der Waal, and D. F. Toerien.
Journal of the Limnological Society of Southern Africa (Bloemfontein), Vol 4, No 2, p 129-144, 1978. 18 Fig, 8 Tab, 52 Ref.

Descriptors: *Lakes, *Limnology, *Biological properties, *Tropic, *Chemical properties, *Physical properties, *Fish management, Turbidity currents, Swamps, Temperature, Surface waters, Sediments, Sampling, Conductivity, Alkalinity, Nitrogen compounds, Phosphorus compounds, Erosion, Erosion control, Algae, Cyanophyta, Silting, Lake basin, Humic acids, Oxygen requirements, Littoral, Vegetation, South Africa, Lake Liambezi(South Africa).

The physical, chemical and biological characteristics of the tropical Lake Liambezi, Caprivi, were studied to determine the fishery potential of the lake and its limnology. The lake is shallow (less than 5 meters) and the depth is fairly constant in the open water. The area of the lake, some 101 square km is surrounded by thick reed swamps and channels, particularly on the south-western shore. Seven sampling stations were established to collect water and bottom samples. High oxygen levels were found at all depths, although photosynthetic activity in the waters was not particularly high. Surface water temperatures ranged from a winter minimum of 15C to a summer maximum of 31C and the pH of the water was fairly alkaline. The conductivity ranged from 17.3 to 41.2 mS per meter. Waters in the reed swamp were brown due to humic substances and high levels of organic nitrogen and phosphorus were also present because of erosion of the lake basin and siltation on the reed swamp side. Planktonic chlorophyll a levels ranged from 1 to 104 microgram per liter with Microcystis as the dominant phytoplankter and the dominant zooplankter was Bosmina. Two new species of blue-green algae were detected. Erosion of the lake basin and the progressive encroachment by Salvinia must be halted if the fishery potential of the lake is to be exploited. PLAYA LAKES CHARACTERIZATION STUDY,
Fish and Wildlife Service, Fort Worth, TX.
D. Curtis, and H. Beierman.
Planning aid report to Water and Power Resources Service, September 1980. 56 p, 11 Fig, 13 tab, 27 Ref. 9228/340/06.

Descriptors: *Playas, *Wildlife, *Vegetation, *Limnology, Geomorphology, Land use, Waterfowl, Water resources, Water conservation, Wildlife habitats, Habitat improvement, Agriculture, Wetlands, Persistence, Colorado, Kansas, Oklahoma, New Mexico, Texas, Llano Estacado.

Because of the potential of playa lakes to provide a supplemental water supply for the Southern High Plains, biological and physical data gathered on 116 playas in the Llano Estacado study area are analyzed. The study area includes the southeast corner of Colorado, the soutwest corner of Kansas, the High Plains portion of western Oklahoma, eastern New Mexico, and northwestern Texas. Current land use of playa basins, playa lake persistence, soils, physiography, alterations of playa basins, water quality, wetlands classification, vegetation, wildlife values, historical condition of playas and historical waterfowl use were determined through field observations and landowner interviews. Playas in the study area provide habitat diversity and produce significant numbers of waterfowl. Economic agricultural benefits can be provided through water conservation practices, while maintaining quality wildlife habitat. Wildlife management measures are recommended for playas which allow for agricultural considerations in their implementation. (Moore - SRC)

DYNAMICS OF DISSOLVED OXYGEN DURING ALGAL BLOOM IN LAKE KASUMIGAURA, JAPAN,
Tsukuba Univ., Ibaraki (Japan). Inst. of Biological Sciences.
H. Seki, M. Takahashi, Y. Hara, and S. Ichimura.
Water Research, Vol 14, No 2, p 179-183, February, 1980. 4 Fig, 4 Tab, 14 Ref.

Descriptors: *Aquatic algae, *Dissolved oxygen, *Stratification, *Lakes, *On-site tests, *Respiration, Eutrophication, Photosynthesis, Phytoplankton, Photosynthetic oxygen, Biochemical oxygen demand, Nitrogen, Nutrients, Phosphorus, Hydrogen ion concentration, Adenosine triphosphate, Light intensity, Euphotic zone, Photometry, Japan, Lake Kasumigaura.

The dynamics of dissolved oxygen (DO) during an algal bloom on Lake Kasumigaura, Japan were studied during a 2-day period in August, 1977. Water samples were collected during an algal bloom every 4 hr at Ibaraki Freshwater Fisheries Experiment Station. Oxygen increases due to photosynthesis were measured in situ in a BOD bottle. A darkened bottle was used to measure any respiration occurring simultaneously with photosynthesis. An Aminco Chemo-Glow-Photometer was used to determine adenosine triphosphate (ATP), nitrate, nitrite, ammonium, and reactive phosphorus. Chlorophyll a levels, pH, redox potential, light intensity, bacterial count, and temperature were also monitored. Phytoplankters of the euphotic zone showed no change in vertical distribution during the study period. DO increased in shallower waters above 60 cm after dawn and reached its peak (190% of saturation) at 12:00, gradually decreasing thereafter. Inorganic nutrients exhibited no stratification during the study period. Nitrogen was the controlling nutrient of the algal bloom activity. The increase in DO by photosynthesis was greater than the decrease of DO by respiration at any depth within the euphotic zone. In the hyperoxygenative zone, most of the excess oxygen from photosythesis was liberated from surface waters into the atmosphere or was consumed by microorganisms. The deeper hypooxygenative layer received oxygen from the hyperoxygenative layer. (Geiger-FRC)

ESTIMATED INFLOW AND EVAPORATION FOR GREAT SALT LAKE, UTAH, 1931-76, WITH REVISED MODEL FOR EVALUATING THE EFFECTS OF DIKES ON THE WATER AND SALT BALANCE OF THE LAKE,
Geological Survey, Salt Lake City, UT. Water Resources Div.
K. M. Waddell, and J. D. Barton.
Utah Division of Water Resources Cooperative Investigation Report No 20, 1980. 57 p, 9 Fig, 13 Tab, 5 Ref.

Descriptors: *Model studies, *Great Salt Lake, *Utah, *Water balance, *Salt balance, Hydrologic budget, Saline lakes, Surface waters, Goundwater, Estimating, Inflow, Evaporation, Precipitation(Atmospheric), Dikes, Computer programs, Mathematical models.

A water budget for Great Salt Lake, Utah, was computed with 1-month intervals for the 46-year period of 1931-76. This budget updates previous computations for 1931-73 on the basis of additional data collected during 1974-76. The storage change during each month was computed from a budget of

surface inflow, groundwater inflow, precipitation on the lake surface, a calibration parameter representing the net deficit between the estimated net inflows and the observed net inflows as computed from the observed altitude hydrograph, and outflow from evaporation. Based on additional pan-evaporation data collected at six sites around the perimeter of the lake, estimates of evaporation rates were reduced about 8%. The annual evaporation ranged from about 2.1 to 3.9 million acre-feet and averaged 2.9 million acre-feet. Based on additional surface-inflow data collected during 1974-76, the annual surface inflow to the lake for 1931-76 ranged from 705,200 (1934) to 3,767,000 (1971) acre-feet and averaged 1,926,000 acre-feet. No changes were made to the 1931-73 estimates of precipitation on the lake surface or to the estimate of ground-water inflow. These averaged 870,000 and 75,000 acre-feet per year, respectively. The total annual inflow to Great Salt Lake during 1931-76 ranged from about 1.3 (1961) to 5.0 (1971 and 1975) million acre-feet and averaged 2.9 million acre-feet. (USGS)

TERRESTRIAL-AQUATIC LINKAGES, COMPONENT INTERACTIONS AND POTENTIAL RESTRICTION OF GROWTH OF THE INTRODUCED AQUATIC WEED MYRIOPHYLLUM SPICATUM L. (WATER MILFOIL) I,
Tennessee Univ., Knoxville.
C. C. Amundsen, A Brenkert, and M. C. Bruner.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-142218, Price codes: A03 in paper copy, A01 in microfiche. Tennessee Water Resources Research Center, University of Tennessee Research Report No 80, April, 1980. 23 p, 1 Fig, 4 Tab, 23 Ref. OWRT-B-042-TENN(1), 14-34-0001-9097.

Descriptors: *Aquatic weed control, *Aquatic weeds, Rooted aquatic plants, *Environmental effects, *Reservoirs, Organic matter, Sediments, Land use, Inflow, Nutrients, Tennessee Valley Authority, *Melton Hill Reservoir(TN), Eurasian Watermilfoil.

Knowledge of plant-sediment interactions is necessary for sound management programs of Eurasion Watermilfoil (Myriophyllum spicatum L.). An investigation of plant and sediment characteristics of TVA Melton Hill Reservoir has been continued in order to further elucidate these relationships. Watermilfoil and sediment samples were collected at five sites in the reservoir. In addition, pre-inundation aerial photographs were examined to determine what the land usage had been under extant watermilfoil beds. Land usage under the five sites sampled and almost all other Melton Hill watermilfoil beds was agricultural. Sediment organic matter, the best overall indicator of nutrient status, varied significantly between sites. Standing crop of watermilfoil also varied significantly with site and with season. A study site in a sheltered embayment had higher sediment organic matter and plant standing crop than the sites in the main reservoir channel. Further detailed nutrient analysis and experimental manipulation in the laboratory is anticipated to more clearly define the relationship of watermilfoil and the sediment.

NITROGEN LOADING: INFLUENCE ON DISSOLVED INORGANIC CARBON IN NATURAL WATERS,
Michigan Univ., Ann Arbor. Div of Biological Sciences.
J. T. Lehman.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-142226, Price codes: A03 in paper copy, A01 in microfiche. Institute of Water Research, Michigan State University, East Lansing, Project Completion Report, December, 1980. 29 p, 7 Fig, 6 Tab, 28 Ref. OWRT A-109-MICH(1), 14-34-0001-0124.

Descriptors: *Alkalinity, *Inorganic carbon, *Nitrogen loading, *Third Sister Lake(MI), Michigan, Carbonate equilibria, Enclosure experiments, *Lakes, Phytoplankton, Respiration, Photosynthesis, Nitrates, Phosphates, Nutrients.

One of the links between physiological activities of phytoplankton and the dissolved inorganic carbon in natural waters is more subtle than the CO2-producing and CO2-consuming processes of respiration and photosynthesis. When phytoplankton absorb nutrients, particularly inorganic nitrogen, they can alter the alkalinity of the water thereby directly affecting the capacity of the system to retain inorganic carbon in solution. This can lead to large differences in both standing stocks and maximal sustained rates of primary production depending on the chemical form of N that is supplied. The extent of these differences have been examined using enclosures of natural lake water enriched with either ammonium or with nitrate in addition to phosphate. The experimental work is supplemented with analyses of lakes that have experienced severe changes in nitrogen loading.

FACTORS INFLUENCING VIABLE BACTERIA IN A TURBID MAN-MADE IMPOUNDMENT.
Orange Free State Univ., BLoemfontein (South Africa). Inst. of Environmental Science.
D. F. Toerien, D. N. Sadie, and P. Stegmann.
Journal of the Limnological Society of Southern Africa (Bloemfontein), Vol 4, No 2, p 89-94, 1978. 1 Fig, 6 Tab, 21 Ref.

Descriptors: *Aerobic bacteria, *Watersheds(Basins), *Dams, *Microbiology, *Fish farming, Surface waters, Least squares method, Sediments, Silting, Correlation analysis, Littoral, Vegetation, Organic compounds, Turbulence, Nutrients, Floods, Erosion, Suspended solids, Productivity, Management, Biomass, Turbidity, South Africa.

The factors which influence the activity of aerobic bacteria in the waters and sediments of the small silt-laden impoundment, Wuras Dam, South Africa, were studied with regard to possible fish production. Five sampling stations were selected in the impoundment and viable bacterial counts from water and soil samples were obtained. The bacterial counts of the bottom samples did not differ significantly from each other, but were much higher than the surface water samples. A significant positive correlation was obtained for suspensoid concentration and viable bacterial numbers suggesting that water turbulence and allochthonous inputs of suspensoids which may be very high during flood may increase the bacterial numbers. The viable bacterial number per milliliter was given as the regression line of 1854 times turbidity as milligrams Si02 per liter minus 3806. The dense stands of plants such as Phragmites and Typha in the littoral zone of the impoundment probably contributes organic matter on which the bacteria thrive. Based on the surface area and water content of the impoundment, the water and the top 2 cm of sediment could contain 19 and 28 tons of bacterial biomass respectively which could be available for the productivity cycle. The microbiology of turbid impoundment appears to be substantially different from that of clear water systems. (Sidney-IPA)

A CONCEPTUAL MODEL OF A SILTATION SYSTEM IN SHALLOW LAKES WITH LITTORAL VEGETATION,
Chile Univ., Santiago. Facultad de Ciencias.
P. J. Weisser.
Journal of the Limnological Society of Southern Africa (Bloemfontein), Vol 4, No 2, p 145-149, 1978. 5 Fig, 19 Ref.

Descriptors: *Lakes, *Shallow water, *Littoral, *Vegetation, *Silting, *Model studies, Sedimentation, Winds, Coriolis force, Wind velocity, Shores, Atmosphere, Energy, Lake basin, Nutrients, Invasion, Erosion control, Weed control, Distribution, Estimating, Management, Marsh management, Turbidity currents, Austria, Malawi.

The uneven distribution patterns of macrophytes in shallow lakes with littoral vegetation is explained by a conceptual siltation model. Turbulence in a shallow lake caused by strong winds produces erosion of the lake floor and suspension of the silt particles. These silt particles are transported by means of water drift into the littoral vegetation where the silt is deposited. The siltation pattern in Lake Neusiedlersee, Austria, was observed and the prevailing NW winds favored siltation in the southern part of the lake. No silting occurred on the steep eastern shores. The siltation model consists of four elements: the atmosphere, the lake basin, the open water surface, and the littoral vegetation. Energy is supplied to the system by the wind, the Coriolis force due to the rotation of the earth and gravity. Different areas of the lake littoral are unequally favored by the siltation mechanism because of the combination of prevailing winds and the deflection caused by Coriolis force. This results in an uneven distribution of nutrients which foster weed growth. Changes in water-level will affect the whole system of siltation and reeds-wamp advancement. The model explains the distribution of the vegetation in lakes Neusiedlersee (Austria) and Chilwa (Malawi) and suggest management options such as raising the water level, creating steeper shores, and fortifying the lake basin to prevent weed encroachment. (Sidney-IPA)

DEVELOPMENT AND APPLICATION OF A FIELD INSTRUMENTATION SYSTEM FOR THE INVESTIGATION OF SURF ZONE HYDRODYNAMICS,
Woods Hole Oceanographic Institution, MA. Dept. of Ocean Engineering.
M. N. Greer.
Dissertation, No WHOI-80-36, August 1980. 175 p, 6 Fig, 4 Tab, 37 Ref, 2 Append. SG-04-7-158-44079.

Descriptors: *Coasts, *Instrumentation, *Hydrodynamics, Ocean waves, Ocean currents, Current meters, Measurement, Maine, Surf zone, Coastal zone, Nearshore process, Sea Grant Program.

The development and application of an autonomous field instrumentation system consisting of four current meters and four wave gauges, along with a field monitor and digital recorder, is documented. Field measurements of waves and currents at four stations across the width of the surf zone were made; using this system at a beach along the southern coast of Maine. Spilling breakers translated across the surf zone, generated an observed net longshore current during the four hour measurement period. The subsequently analyzed data from this experiment showed a strong longshore current which varied across the width of the surf zone, having a maximum of about 15 cm/sec just inside the breaker line. A net offshore current was observed at all four stations, and averaged approximately 10 cm/sec to 15 cm/sec. Using a simplified force balance model for the generation of longshore currents on a plane, uniform beach, the data was further analyzed to investigate the validity and parameterization of the momentum flux forces and bottom friction forces within the surf zone. There was an observed shoreward loss in momentum flux across the width of the surf zone, from about 150,000 dynes/cm outside the breakers to near zero close to the shoreward extent of the surf zone. RECONNAISSANCE OF CHEMICAL QUALITY OF SURFACE WATER AND FLUVIAL SEDIMENT IN THE DIRTY DEVIL RIVER BASIN, UTAH,
Geological Survey, Salt Lake City, UT. Water Resources Div.
J. C. Mundorff.
Utah Department of Natural Resources Technical Publication No 65, 1979. 132 p, 4 Fig, 3 Plates, 7 Tab, 21 Ref.

Descriptors: *Water quality, *Chemical analysis, *Surface waters, *Fluvial sediments, Streams, Sediment yield, Hydrologic data, Streamflow, Pollutant identification, Water supply, Hydrogeology, Utah, *Dirty Devil River basin(UT), *Upper Colorado River basin(UT).

This water-quality reconnaissance in the Dirty Devil River basin, Utah, covers an area of about 4,300 square miles. Data were obtained by the U.S. Geological Survey one or more times at 104 sites during the period from July 1975 to September 1976. The most pronounced change in chemical characteristics of water in streams in the Dirty Devil River basin occurs in a 15-mile reach of Muddy Creek between the major diversions 5 miles north of Emery and the point at which Highway I-70 crosses Muddy Creek. Dissolved-solids concentrations at the diversions are generally less than 300 milligrams per liter and at the lower end of the reach are commonly greater than 2,000 milligrams per liter. The Dirty Devil River, which is formed by the confluence of Muddy Creek and the Fremont River, has no perennial tributaries. Except during short periods of the thunderstorm runoff in tributaries, the flow is simply a composite of flow from Muddy Creek and the Fremont River. A few data on total coliform, fecal coliform, and fecal streptococci bacteria suggest a general absence of major biological pollution in the basin. Sediment discharge from the upper 1,000 square miles of the Fremont River basin and from the upper 400 square miles of Muddy Creek Basin is a very small part of sediment discharge of the Dirty Devil River. Less than half of the remaining 2,900 square miles of drainage area of the Dirty Devil River probably contributes most of the sediment that is discharged by the streams during a very small part of the time each year. HOLOCENE GEOMORPHIC EVOLUTION OF A BARRIER-SALT MARSH SYSTEM, SW DELAWARE BAY,
Ankara Univ., (Turkey). Dept. of Geography and Geology.
I. Kayan, and J. C. Kraft.
Southeastern Geology, Vol 20, No 2, p 79-100, March 1979. 15 Fig, 21 Ref.

Descriptors: *Geomorphology, *Estuaries, Barriers, Salt Marshes, *Sedimentology, Aerial photography, *Halocene, *Delaware Bay, Paleogeomorphology, Coastal processes, Sea Grant Program.

Delaware Bay is one of the larger estuaries along the eastern coast of North America. The paleogeomorphology of a portion of the southwest coast of Delaware Bay at Cedar Creek-Slaughter Beach has been delineated from airphoto studies, surface sedimentological and geomorphic studies of present day coastal envoronments, and sedimentological and paleontological studies of subsurface sediments of the latter half of the Holocene Epoch. Radiocarbon data from sedimentary environmental lithosomes clearly indicate that estuarine conditions existed in the study area around 5000 B.P. Studies of the sediments and the shapes of the sedimentary bodies encountered in a drilling program in a small area show that it is possible to make paleogeographic reconstructions of coastal zone environments during the Holocene in the Cedar Creek-Slaughter Beach area. It is possible to predict a rate of coastal erosion of approximately one meter per year in the area, based on observation of ongoing coastal processes and the geologic record of the last half of the Holocene. Boston Harbor (and its approches) is a glacially carved, tidally dominated estuary in western Massachusetts Bay. Characterized by low river discharge and significant human impact, the harbor is typical of many bays and estuaries along the New England coast. Modern organic-rich sediments are accumulating in several depocenters at an estimated rate of 0.2-0.3 cm/yr. The high organic matter content (greater than 10%) of these modern sediments is attributed in part of anthropogenic wastes. Wastes rich in trace metals are discharged into the harbor from the sewage treatment facility at Deer Island and from numerous point sources in the Inner Harbor. Trace metal profiles in the bottom sediments reflect the increasing use and discharge of these metals during the past 100 years. Large variations in several cores may be related to circulation changes accompanying the closing of Shirley Gut in 1936. In the water column, silt and clay sized mineral grains are suspended together in organically bound agglomerates. The organic film binding these particles is a by-product of biological activity and aids in the deposition of particulates and pollutants. (NOAA)

EXTENSION OF TRANSIENT-FLOW MODEL OF THE SACRAMENTO RIVER AT SACRAMENTO, CALIFORNIA,
Geological Survey, Menlo Park, CA. Water Resources Div.
R. N. Oltmann.
Geological Survey Water-Resources Investigations 80-30, July 1980. 25 p, 13 Fig, 1 Tab, 4 Ref.

Descriptors: *Unsteady flow, *Tidal streams, *Model studies, *Streamflow, Tidal effects, Computer models, Simulaltion analysis, Methodology, Non-uniform flow, Open channel flow, Flow rates, Stream gages, *Sacramento River(CA), Sacramento-Hood tidal reach(CA).

The multiple-reach method-of-characteristics flow-simulaltion model that was successfully applied in 1976 to a 10.8-mile tide-affected reach of the Sacramento River, in California, from Sacramento to Freeport has been extended 10.5 miles farther downstream of Hood. The model reach was extended to improve the quality of the model's output during low-flow conditons for the streamflow station located at the upstream end of the reach, and to provide flow data at additonal sites farther downstream toward the San Francisco Bay system. The extension of the reach, however, has not improved the quality of the model's low-flow output but it has provided flow data for sites farther downstream on the Sacramento River. (USGS)

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

3A. Saline Water Conversion

PILOT PLANT STUDY ON MARINE MICROORGANISMS AND ORGANIC MATTER IN SEAWATER DESALINATION BY REVERSE OSMOSIS,
Permutit Co., Inc., Monmouth Junction, NJ.
A. B. Mindler, and S. T. Bateman.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-131468, Price codes: A07 in paper copy, A01 in microfiche. Report submitted to Office of Water Research and Technology, May 12, 1980. 130 p, 13 Fig, 2 Tab, 72 Ref, 4 Append. OWRT-C-80316-S(No 8538)(1), 14-34-0001-8538(1).

Descriptors: *Desalination, *Reverse osmosis, *Sea water, *Fouling, Pretreatment, *Marine organisms, *Organic matter, Chlorination, Dechlorination, Bacteria, Oxidation-reduction potential, Corrosion, *St. Croix, Virgin Islands.

A seawater desalination pilot plant was operated for one year under tropical conditions (St. Croix, U.S.V.I.) with emphasis on biological aspects. Pretreatment consisted of chlorination, in-line coagulation with iron sulfate, filtration, dechlorination with excess sodium bisulfite, and alkaline scale prevention by two methods operated in parallel. On-stream time was about 50%. The productivity of the 4 inch duPont B-10 hollow fiber permeator on pH adjusted feed decreased to 765 gpd (74% of projected productivity) in 2700 hours, and to 850 gpd (87% of projected productivity) in 4460 hours on the permeator on antiscalant feed. Rejections were in excess of 98.9 and 99.1%, respectively at 30% recovery. There was an increased amount of biological growth in the antiscalant system on pipelines, tanks and cartridge filters after dechlorination, compared to the acidified system. There was no evidence that this observed biofouling adversely affected either system in reverse osmosis performance. Autopsies performed on two permeators indicated the presence of iron oxide, copper, and silica, but little or no organic fouling. The bacteria counts were reduced by chlorination from about a million cells/ml in raw seawater to about a hundred/ml after filtration, but counts returned to near the original levels after dechlorination. Algae and protozoa were controlled by adding copper sulfate and excluding light. The pretreatment system changed the order of predomination of species of bacteria from a mixed variety to those with enchanced periphytic and slime-producing capability. A submerged glass slide technique was found useful for quantifying the periphytic organisms. T0C levels of 1.0 mg/1 were unchanged throughout the pretreatment process.

LOWED BY DEVELOPMENT TESTS OF THE MODIFIED SINGLE-STAGE DESALTING PILOT PLANT AT WRIGHTSVILLE BEACH, NORTH CAROLINA,
Avco System Div., Wilmington, MA.
R. J. Campbell, and E. W. Duvall.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-136897, Price codes: A05 in paper copy, A01 in microfiche. Final Report to Office of Water Research and Technology (1979). 72 p, 22 Fig, 3 Tab, 7 Ref. OWRT (No 7514)(1), 14-34-001-7514.

Descriptors: *Desalination apparatus, *Desalination plants, *Pilot plants, *Desalination processes, *Separation techniques, Saline water, Treatment, Water treatment, Water purification, Treatment facilities, Equipment, Research and Development, North Carolina, Desalination, Laboratory tests, Testing, Engineering structure, Instrumentation.

This was the final report of a project that covered the design, procurement and installation of a gravity wash column and other modifications to the existing 75,000 gallons per day Crystalex pilot plant located at Wrightsville Beach, North Carolina. Following modifications, development tests were conducted to evaluate plant performance with a gravity wash column. Earlier study had revealed that the large scale 5-foot diameter pressurized counterflow wash column with annular screen design has a number of problems. Use of a new 13-foot diameter gravity wash column design was based on laboratory test data. Laboratory test data and experience also indicated improvements could be made in level controls, pressure transmitters, blow seals, wash water ratio control, and other system areas, and such improvements were incorporated in the Wrightsville plant system. The major pilot plant problem area needing additional design development study annd testing is the configuration of the gravity wash column and its drain screen. Use of warm fluid passages appeared feasible to alleviate screen freezing problems in the pressurized wash column. Other options have been considered. Most of the modified pilot plant system performed reasonably well. Pending improvement for the wash column as outlined could result in the desired performance. (Zielinski-IPA)

3B. Water Yield Improvement

CREATING AND MAINTAINING A POOL OF FRESH WATER ON A TABULAR ICEBERG,
ITI Ltd., Paris (France). (Assignee).
G. L. Mougin.
U.S. Patent No 4,191,491, 4 p, 3 Fig, 4 Ref; Official Gazette of the United States Patent Office, Vol 992, No 1, p 201, March 4, 1980.

Descriptors: *Patents, *Freshwater, Icebergs, Melt water, Solar radiation, Evaporation, Water sources.

Tabular icebergs can be used as a source of fresh water in arid regions if they are transported from the Artarctic to where there is a need for water. To help reduce the rate at which solar radiation melts the iceberg on its journey, pools of fresh water are maintained on its upper surface, thereby taking advantage of the fact that the latent heat of evaporation of water is about seven times that of fusion of ice. The pools are created by protecting a closed path on the surface of the iceberg from melting by means of flexible sheet material. The protected path then forms the walls of the pool. At its destination the iceberg's pools can be given a V-shaped bottom to help increase the rate at which the iceberg is turned into fresh water. (Sinha - OEIS)

3C. Use Of Water Of Impaired Quality

FIELD EXPERIMENTS ON APPLICATION OF TREATED MUNICIPAL WASTE WATERS TO VEGETATED LANDS,
Tehran Univ. (Iran).
M. Sanai, and J. Shayegan.
Water Pollution Control, Vol 79, No 1, p 126-135, 1980. 4 Fig, 3 Tab, 11 Ref.

Descriptors: *Waste water disposal, *Nutrients, *Crop production, *Return flow, *Irrigation effects, Soil contamination, Sewage treatment, Fertilizer, Alfalfa, Corn, Wheat, Potatoes, Irrigation programs, Impaired water use, Semiarid climates, Crop response.

Field experiments were conducted to determine long term ecological effects of spray irrigating crop land with secondary treated sewage. Chemical analyses of soil, plant tissues, fertilizer, and atmospheric precipitation as well as routine water quality tests were conducted on test plots of alfalfa, corn, potato and wheat over a three-year period. Plots were irrigated either with secondary effluent, freshwater with fertilizer, or freshwater alone. Field productivity and the balance of nitrogen, phosphate, potassium and other nutrients were measured. The crop yields obtained from waste water irrigated plots were consistently higher than yields obtained from waste water irrigated plots were consistently higher than yields from either freshwater irrigated plot. Findings suggest that uniform and gradual nutrient application during irrigation enchances productivity. Corn exhibited the highest productivity and greatest potential for nutrient removal under waste irrigation. A gradual increase in phosphorous concentrations in the soil was observed over three years which suggests possible long term soil pollution and toxicity if nutrient application is not controlled. The irrigation method demonstrates highly efficient nutrient removal and has particular application in semi-arid agricultural areas. (Titus-FRC)

PLANNING REPORT FOR THE IRRIGATION PORTION OF A DUAL WATER SYSTEM FOR WEST JORDAN CITY, SALT LAKE COUNTY, UTAH,
Utah Div. of Water Resources, Salt Lake City.
B. C. Saunders, K. Arthur, and L. Summers.
Report, August, 1980. 33 p, 6 Fig, 1 Ref.

Descriptors: *Utah, *Irrigation design, *Beneficial use, *Municipal water, *Economic feasibility, Water supply, Lakes, *Comprehensive planning, Financial feasibility, Projections, Water demand, Multiple purpose projects, Cost estimates, Task force, Impaired water quality, *Impaired water use, Jordan City area(UT).

As agricultural demand for Utah Lake water in Salt Lake County diminishes because of urbanization, local water management agencies are investigating how the excess low-quality water can be used beneficially. A feasibility analysis was conducted to determine if the water could be used for lawns and gardens. Installing a pressurized irrigation system for lawns and gardens, leaving the present high-quality water for culinary requirements only, would significantly extend the life of the present high-quality water system. West Jordan City was chosen as being representative of the physical and growth characteristics of the southwest quadrant of Salt Lake County. Economic analysis concluded that the new pressurized irrigation system is not feasible at this time unless the price of high-quality water increases. The cost to retrofit present subdivisions to serve the 1980 population of 30,000 and the future growth of West Jordan (for 50 years) is approximately $11,460,000. An increased water charge per 1/4 acre lot would be about $9.50 per month, or $113 per year. A telephone survey concluded that the few residents on a dual irrigation system are satisfied. (Vernale-Omniplan)

3E. Conservation In Industry

STUDY OF THE POTENTIAL FOR WATER REUSE IN THE STEEL INDUSTRY,
Hydrotechnic Corp. New York.
D. D. Ruggiero, H. Hofstein, A. H. Danzberger, J. T. Chu, and M. Strully.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-122673, Price codes: A05 in paper copy, A01 microfiche. Office of Water Research and Techology Report OWRT/RU-80/2, September 1980. 72 p, 8 Fig, 19 Tab, Append. OWRT-C-80141-R (No 8816)(1), 14-34-0001-8816.

Descriptors: *Water pollution control, *Water conservation, *Water reuse, Water quality *Wastewater treatment, Industrial water, Consumptive use, Water management, Industrial wastes, Steel plant wastewater.

This report presents the results of an engineering study of water use in the steel industry in the United States. Water requirements are presented with respect to quality and quanity for the major production processes in integrated steel plants. Water requirements are presented on a national level for iron and steel production in 1977 and anticipated production for the years 1958 and 2000 under three environmental criteria, i.e., those mandated under PL 96-217 of Best Practicable Technology Currently Available (BPT), Best Available Technology Economically Achievable (BAT) and Zero Discharge of Pollutants. It is shown that, to meet these three criteria, increased recirculation of water within integrated steel plants is necessary and, as a result of this recirculation, the quantities of fresh water required is decreased. To improve effluent quality from that attainable under BPT to that attainable under BAT would result in a 38% reduction in fresh water supply required, and when the quality is further improved to zero pollution, the quantity is reduced by an additional 48%, or a total reduction between BPT and zero pollution of 86%. The report describes how increased water reuse within an integrated steel plant may be accomplished and how geographically proximate industries may utilize each other's wastewaters. In attaining the environmental goals, technological and socio-economic stresses result. Research needs to minimize these are described.

WATER CONSERVATION ON THE UPPER MISSOURI AND MISSISSIPPI RIVERS THROUGH THERMAL STANDARDS MODIFICATIONS,
Iowa Univ., Iowa City. Inst. of Hydraulic Research.
A. R. Giaquinta, and T. E. Croley, II
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-133704. Price codes: A03 in paper copy, A01 in microfiche. Iowa State Water Resources Research Institute. Iowa State University, Ames, Completion Report No ISWRRI-100, September, 1980. 34 p, 7 Fig, 5 Tab, 15 Ref. OWRT-B-061-IA(1), 14-34-0001-8017.

Descriptors: *Water conservation, *Thermal pollution, *Thermal powerplants, *Water quality standards, *Missouri River, *Mississippi River, Mathematical studies, Economics, Economic justification, Economic prediction, Power plants, Heat transfer, Heated water, Water pollution, Water pollution sources, Facilities, Legal aspects, Water temperature.

Twenty existing power plants and other industries and municipalities located along the Missouri and Upper Mississippi River impose thermal loads on the river system. Industrial/municipal sources, due to their low thermal loads relative to power plant head loads, were excluded from this study. All power plants were assumed to operate at 80% capacity factor. Fixed-charged rates of 17.90 and 14.75% were used in the economic analysis of existing and proposed power plants, respectively Computational procedures were used to compute cooling-related costs of power production and water consumption for changing thermal standards. Coding related power production costs for several different hypothetical thermal standards were computed for all existing/proposed plants. These costs were compared and marginal trade-off relationships were computed. The thermal standards considered were the free-discharge and no discharge standards, the existing standards of the States, and several standards given as temperature

decrements for the existing standard. There would be considerably more heat assimilation capacity in the river using the relaxed standards, providing the ability to size larger future 'permissible' plants at specified locations. (Zielinski-IPA)

PROCESS AND APPARATUS FOR DEWATERING GRANULATED MATERIAL, ESPECIALLY GRANULATED BLAST FURNACE SLAG,
E. Muller-Spath, K. Muller, H. Kister, W. Schurhoff, and F. W. Hillnhutter.
U.S. Patent No 4,196,078, 8 p, 7 Fig, 1 Ref; Official Gazette of the United States Patent Office, Vol 993, No 1, p 243, April 1, 1980.

Descriptors: *Patents, *Waste water treatment, *Water reuse, Industrial wastes, Water purification, Dewatering, Equipment, Filtration, Blast furnace slag.

A process for dewatering granular bulk material, especially blast furnace slag, which is granulated to sand by the injection of water into the liquid slag stream is described. The slag sand-water mixture is fed to a bucket wheel device, the slag sand is dewatered in perforated scoops of the bucket wheel and fed to a continuous conveyor via a hopper, and the water overflowing from a trough of the bucket wheel device which is contaminated by solids, is clarified. The contaminated water is collected in filter chutes and continuously filtered and then fed to a settling tank for reuse. (Sinha - OEIS)
W81-00720

3F. Conservation In Agriculture

INVESTIGATION OF FACTORS AFFECTING ENERGY FOR IRRIGATION PUMPING,
Oklahoma State Univ., Stillwater. Dept. of Agricultural Engineering.
A. D. Barefoot.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-127557, Price codes: A02 in paper copy, A01 in microfiche. Oklahoma Water Resources Research Institute, Oklahoma State University Technical Completion Report, September, 1980. 10 p, 2 Tab, 8 Ref. OWRT-A-081-OKLA(1), 14-34-0001-8038.

Descriptors: Irrigation water, *Pumping plants, *Pumping tests, Pumps, *Irrigation wells, *Energy loss, *Efficiencies, Water sources, Water wells, Wells, Irrigation systems, Irrigation practices, Water demand, Irrigation efficiency, Energy budget, Energy, Energy dissipation, Irrigation, Pumping, Consumptive use, Optimization.

Operation efficiency was evaluated for 19 irrigation pumping plants covering five counties in Oklahoma. Most were operated using natural gas; a few using electricity. Most of the irrigation pumps tested were found to be operating at fairly high efficiency levels. Average pump efficiency was found to be about 62%. Newly-installed pumps should operate at near 70% efficiency. Average engine efficiency was found to be about 20%. The average overall pumping efficiency of 13.9% could be increased through better design engineering of pumping plant installations. An efficiency of 15% or higher is desirable. Improved matching of engines to pumps and pumps to well conditions would, in the long term, help reduce irrigation energy use. A rigorous maintenance program coupled to careful matching of engine speed to optimum pump speed could assist final bill reductions for irrigation farmers in the short term. An ongoing program of the type conducted under this study would provide Oklahoma irrigation farmers the means needed to determine the conditions for most efficient operation of their pumping plants. (Zielinski-IPA)
W81-00509

DRIP IRRIGATION SYSTEM FOR AGRICULTURE,
L. E. Sample.
U.S. Patent No 4,191,330, 8 p, 5 Fig, 6 Ref; Official Gazette of the United States Patent Office, Vol 992, No 1, p 149, March 4, 1980.

Descriptors: *Patents, *Irrigation systems, *Application equipment, Irrigation efficiency, Irrigation practices, Irrigation operation and maintenance, Drip irrigation.

A drip irrigation system comprises water distribution lines extending across a field or similar area for growing crops. The lines are arranged in at least two separate groups, and the lines in each of the groups are interconnected. A source of pressurized, substantially unfiltered water is selectively connected to the lines, and emitters are connected with and spaced along each of the lines for discharging water into the soil. Each emitter has an orifice sized to generally allow foreign material in the unfiltered water to pass through. A water distributor has an inlet portion connected to the water source, and at least two outlet ports each connected to one of the water line groups. A sequencing valve indexes between the first and second ports, and sequencially and individually connected each of the line groups with the water source, whereby surges of water rush through the line to alleviate clogging of the orifices by the foreign material in the water. (Sinha - OEIS)
W81-00538

IRRIGATION PIPE CONTROL SYSTEM,
Colkhi, Inc. San Diego, Ca. (Assignee)
E. F. Jacobi, and M. R. Madden.
U.S. Patent No 4,191,207, 7 p, 5 Fig, 9 Ref; Official Gazette of the United States Patent Office, Vol 992, No 1, p 108, March 4, 1980.

Descriptors: *Patents, *Irrigation systems, *Control systems, Lateral conveyance structures, Pipes, Instrumentation, Irrigation efficiency, Lasers, Alignment, Phototransducers.

A laser referenced control system for maintaining sequence and correcting the deflections of a moving irrigation pipe includes a laser positioned on a reference coordinate against which the irrigation program sequence and the motion of the pipe are taken. In typical use the pipe is supported on powered wheeled carriages which move across the irrigated terrain at a predetermined rate and it is these wheeled carriages that are controlled according to the deviation of the end of the pipe relative the laser optical axis. This deviation is measured in a fore and aft plane by a phototransducer array to provide the control inputs to the carriages, the vertical terrain undulations being compensated by way of a laser alignment servosystem. In this manner the vertical changes in pipe alignment are taken out, the only correction being made in the plane of translation. (Sinha - OEIS)
W81-00539

AUTOMATIC WIND BRACE FOR SIDE ROLL IRRIGATION SYSTEM,
L. W. Baker.
U.S. Patent No 4,191,206, 7 p, 5 Fig, 4 Ref; Official Gazette of the United States Patent Office, Vol 992, No 1, p 107-108, March 4, 1980.

Descriptors: *Patents, *Irrigation systems, *Irrigation efficiency, Application equipment, Lateral conveyance structures, Winds, Damage, Irrigation operation and maintenance, Braces.

Wheel supported, side roll irrigation systems may extend for one-half mile or more and are moved by a cental, power-driven mover or a number of such movers. When empty, and therefore quite light in weight, winds of even moderate velocity may cause the wheels to roll relative to the mover, in which case the irrigation pipes become twisted or otherwise damaged. This invention provides for an automatic wind brace which includes an elongated brace member mounted pivotally adjacent its inner end on a base member suported by the irrigation system at a location radially outward of the axis of the supporting wheels, and an extensible damper member pivotally interconnecting the base and brace members for delaying movement of the brace member from its retracted inoperative position placed substantially parallel to the irrigation pipeline, to its extended, operative position projecting angularly downward into engagement of its outer end with the ground. (Sinha - OEIS)
W81-00540

WHEEL RUT CLOSING DEVICE FOR IRRIGATION SYSTEM,
Geobel (Ray) and Sons, Inc., Lebanon, SD. (Assignee).
L. W. Goebel.
U.S. Patent No 4,192,388, 5 p, 6 Fig, 18 Ref; Official Gazette of the United States Patent Office, Vol 992, No 2, p 508, March 11, 1980.

Descriptors: *Patents, *Irrigation systems, Application equipment, Operation and maintenance, Irigation efficiency, Wheel ruts.

A new and useful device is used in combination with an irrigation system having an irrigation line, and an irrigation line support or supports mounted on a wheel or a number of wheels, to close a wheel rut or ruts created by the wheel or wheels. The wheel rut closing device is mounted on each irrigation line support and generally comprises an implement support frame mounted on the irrigation line support and extending generally rearward of the wheel. A rearwardly trailing implement holder is pivotally connected to the frame and means are carried by the holder for closing a wheel rut or ruts. The frame and the holder can be raised and lowered to the desired height. (Sinha - OEIS)
W81-00541

ARGICULTURAL IRRIGATION SYSTEM AND COMPONENTS THEREFOR,
CH20, Inc., La Grande, OR. (Assignee).
B. Courtright.
U. S. Patent No 4,192,340, 12 p, 13 Fig, 3 Ref; Official Gazette of the United States Patent Office, Vol 992, No 2, p 490, March 11, 1980.

Descriptors: *Patents, *Irrigation systems, *Hydraulic systems, Application equipment, Operation and maintenance, Irrigation efficiency, Booster units.

An agricultural irrigation wheel line is provided having a line translational propulsion unit and also a series of torque assist or torque booster units spaced along the line. All of the units are preferably hydraulically driven by water pressure in the irrigation line itself. The master unit is generally provided a coupling, for the hose to be dragged over the field and coupled to a water-pressure source. Both the master and the booster units are coupled to and driven by line pressure in the wheel line, supplying pressured water for spray equipment carried by the line, advancing the line and torquing the same. Controls are provided the units for regulating the stall-out condition of each unit. The units speed up, slow down, or stall out, automatically in response to an undesired line condition, i.e. deflection or deviation from the essential rectilinear condition desired. The same applies to the booster units coupled to mutually spaced points along the line. (Sinha - OEIS)
W81-00542

GUIDANCE SYSTEM FOR IRRIGATION SPRINKLING APPARATUS,
N. S. Standal.
U.S. Patent No 4,192,335, 15 p, 30 Fig, 17 Ref; Official Gazette of the United States Patent Office, Vol 992, No 2, p 488, March 11, 1980.

Descriptors: *Patents, *Irrigation systems, *Sprinkler irrigation, Application equipment, Hydraulic systems, Operation and maintenance, Irrigation efficiency, Guidance systems, Risers.

A sprinkling apparatus is powered for movement along a row of spaced risers. It is guided along a

path parallel to the risers without any physical guidance being provided in the spaces between them. A coupler engages each successive riser and selectively completes a hydraulic circuit between the riser and the sprinkling apparatus. Mechanical indexing and engagement of the coupler relative to the riser is used as a guide for modifying the direction of movement of the sprinkling apparatus in order to permit engagement of the next successive riser by the coupler. All functions of the sprinkling apparatus are automatically sequenced upon engagement of selected risers. Alternate risers can be skipped. Reversal of the sprinkling apparatus can be achieved by placement of stop mechanisms along the row of risers. (Sinha - OEIS)
W81-00543

HIGH CAPACITY SPRINKLER HEAD WITH IMPROVED BRAKE MECHANISM,
Nelson Irrigation Corp., Walla Walla, WA. (Assignee).
L. P. Meyer.
U.S. Patent No 4,193,548, 8 p, 5 Fig, 7 Ref; Official Gazette of the United States Patent Office, Vol 992, No 3, p 802, March 18, 1980.

Descriptors: *Patents, *Irrigation, *Sprinkler irrigation, Irrigation operation and maintenance, Application equipment, Irrigation efficiency.

A step-by-step rotary sprinkler head is comprised of a stationary annular housing assembly, an annular mounting member supported within the upper end portion of the housing for rotational movement about a generally vertically extending axis. The mounting member has three sets of equally spaced holes extending vertically. An annular brake member has a set of equally spaced stub shafts extending vertically which slidably engage within one set of holes. The annular brake member has a downwardly facing annular brake surface which engages a fixed upwardly facing brake surface provided by the housing. A sprinkler body assembly is carried by the mounting member and is fixedly secured by bolts. A series of coil springs is mounted within a third one of the sets of holes to resiliently urge the interengaging brake surfaces together with a constant spring force. (Sinha - OEIS)
W81-00544

FLOW CONTROL VALVE FOR SUBSURFACE IRRIGATION SYSTEM,
S. Riusech.
U.S. Patent No 4,193,711, 4 p, 5 Fig, 4 Ref; Official Gazette of the United States Patent Office, Vol 992, No 3, p 956, March 18, 1980.

Descriptors: *Patents, *Irrigation systems, *Subsurface irrigation, Flow control, Application equipment, Irrigation efficiency, Irrigation operation and maintenance, Valves.

The invention provides an improved flow control valve structure for use in a subsurface irrigation system. It is designed to control the water flow characteristics of the system so that generally the water distribution is similar throughout the field in the sense that one portion is not overwatered excessively in relation to other portions of the field. The valve includes a foot with a pair of oppositely facing laterally opening holes. The foot is sized to extend through the hole in the bottom surface of a pipe of the system and has an upstanding leg of flexible material to be received within the pipe in a flexed condition. The leg has a longitudinal passageway to deliver fluid flowing in the pipe to the holes in the foot; to the leg, a flexible tube extension is fitted to extend within the pipe and which is of a preselected length, to present predetermined resistance to the water flow, so that the distribution from the system may be generally equalized by selecting the proper length tube extension. (Sinha - OEIS)

AGRICULTURAL WATER USE AND COSTS IN CALIFORNIA,
California Univ., Berkeley.
A. Highstreet, C. F. Nuckton, and G. L. Horner.
University of California, Giannini Foundation of Economics, Information Series 80-2, Division of Agricultural Sciences Bulletin 1896. July, 1980. 41 p, 1 Fig, 5 Tab, 11 Append.

Descriptors: *California, *Water costs, *Crop production budgets, *Irrigation systems, Agricultural watersheds, Application methods, Regional analysis, Water resources development, Field crops, Surface water, Groundwater, Economic evaluation, Drought tolerace.

Eighty-five percent of water used in California initially goes to agriculture; the remainder to municipalities and industries. Predominant regional crops were determined using the County Agricultural Commissioner's 1975 acreage basis in three categories: field crops, fruits and nuts, and vegetables. Interviews with University of California Cooperative Extension county farm advisors in 1979 were the primary source of information on water sources (ground or surface) and application methods used for each regional crop. Estimated regional irrigation costs for each crop are differentiated by water source, application rate, and irrigation method in 13 production regions of California. Application rates vary from region to region for the same crop due to differences in climate, soil type, and the availability and cost of water. Computer modeling was used to determine crop production budgets. Future changes in water use may be necessitated by competing demands for water, increasing water costs, or diminished water quality or quantity. (Vernale-Omniplan)
W81-00644

AUTOMATIC CONTROL OF THE MOISTURE CONTENT OF THE SOIL,
L. H. Birnbach, and C. A. Birnbach.
U.S. Patent No 4,194,691, 10 p, 10 Fig, 5 Ref; Official Gazette of the United States Patent Office, Vol 992, No 4, p 1286, March 25, 1980.

Descriptors: *Patents, *Irrigation, *Soil moisture, *Control systems, Moisture content, Water delivery, Irrigation efficiency, Water requirements, Automatic control.

The moisture content of the soil in each of a number of areas is maintained between predetermined wet and dry thresholds by a control having circuits operative in response to detected thresholds through contacts inserted in the soil to effect the opening and closing of a valve in the conduit by which water is delivered to that area. Typically a number of conduits are connected directly or through junctions to a common water supply and where that supply is pump controlled, the control for each conduit includes circuitry that enables a switch in the pump circuit to be closed whenever the valve operated by that control is open. (Sinha - OEIS)
W81-00708

IRRIGATION EMITTER SYSTEM,
E. Schopp.
U.S. Patent No 4,194,695, 4 p, 2 Fig, 5 Ref; Official Gazette of the United States Patent Office, Vol 992, No 4, p 1287, March 25, 1980.

Descriptors: *Patents, *Irrigation, *Application equipment, Irrigation efficiency, Irrigation operation and maintenance, Emitters, Drip irrigation.

An irrigation emitter system utilizes a tubular adapter member which is formed of non-rigid plastic material. Self-sealing coupling plugs are connected through the wall surfaces of the adapter member to couple liquid from the adapter member to outlet tubes. A pressure reducing mechanisms is formed in the adapter member for enabling the plugs to be coupled directly to the tubes for distribution of the liquid. The invention eliminates the need for utilizing a drip regulator emitter intermediate the distribution hoses and the pressure regulated adapter and uses a relatively simple pressure member enabling self-sealing coupling plugs to interconnect the flexible distribution hose directly to the adapter. (Sinha - OEIS)
W81-00709

SELF-PROPELLED IRRIGATION APPARATUS,
Moulton Irrigation Co., Somerset, WI. (Assignee).
D. C. Scholz.
U.S. Patent No 4,195,781, 12 p, 12 Fig, 5 Ref; Official Gazette of the United States Patent Office, Vol 993, No 1, p 150, April 1, 1980.

Descriptors: *Patents, *Irrigation systems, Sprinkler irrigation, Control systems, Irrigation operation and maintenance, Irrigation efficiency, Self-propelled irrigation system.

A self-propelled irrigation apparatus has a main pressurized water distribution pipe with its inner end pivotally supported at a central supply pipe and radially extending distribution pipe sections which have swinging connections with each other. It has a mobile support at the outer end of a section, a water reaction spray motor for driving each mobile support and a diaphragm-operated 'on-off' motor control valve connecting the motor to the distribution pipe. A pilot valve selectively connects a pressure control chamber at one side of the control valve diaphragm with either the pressurized water in the pipe or with a pressure relief opening in response to predetermined relative swinging movement of the pipe sections. The apparatus also has one or more controllable irrigation sprinkler units connected to the distribution pipe by a separate diaphragm operated 'on-off' sprinkler control valve at a location spaced from the reaction motor. The sprinkler control valve has a similar pressure control chamber connected to the same pilot valve for simultaneous 'on' or 'off' control of the reaction motor and sprinkler unit (Sinha - OEIS)
W81-00715

METHOD AND DEVICE FOR ENHANCING THE DISTRIBUTION OF WATER FROM A SPRINKLER OPERATED AT LOW PRESSURES,
Rain Bird Sprinkler Mfg. Corp., Glendora, CA. (Assignee).
E. M. Troup.
U.S. Patent No 4,195,782, 5 p, 3 Fig, 4 Ref; Official Gazette of the United States Patent Office, Vol 993, No 1, p 150, April 1, 1980.

Descriptors: *Patents, *Irrigation, *Sprinkler irrigation, Application equipment, Irrigation operation and maintenance, Irrigation efficiency, Nozzles.

A new and improved nozzle and method of operation for use in irrigation sprinklers of the impact and reaction drive types is described. Water may be evenly distributed over the range of the sprinkler even when operating at relatively low supply pressures. This is accomplished generally by a nozzle which separates the stream of water flowing through the sprinkler into at least two separate and distinct streams of water, and directs these distinct streams so that they intersect at a predetermined angle after being ejected from the nozzle. On intersection of the streams, the resultant stream is broken into sufficiently small droplets to provide the desired distribution of water by the sprinkler. (Sinha - OEIS)
W81-00716

THREE LAYER IRRIGATION TUBE AND APPARATUS AND METHOD FOR PRODUCING SAME,
G. Gilead.
U.S. Patent No 4,195,784, 9 p, 16 Fig, 6 Ref; Official Gazette of the United States Patent Office, Vol 993, No 1, p 151, April 1, 1980.

Descriptors: *Patents, *Irrigation systems, Water delivery, Irrigation operation and maintenance, Irrigation efficiency, Equipment, *Drip irrigation.

A drip irrigation apparatus comprises a first, second and third layers of sheet material, the layers of material being elongate and arranged so that their side edges lie in confronting and coextensive arrangement. The first, second and third layers are joined to each other at their side edges to define a water supply passage between the first and second

layers and to define a water discharge passage between the second and third layers. The second layer is apertured to provide fluid communication between the water supply passage and the water discharge passage. A method and apparatus for producing the drip irrigation apparatus is also provided. (Sinha-OEIS)

DETERMINATION OF WATER SATURATION IN SUBSURFACE EARTH FORMATIONS ADJACENT WELL BOREHOLES,
Texaco Inc., White Plains, NY. (Assignee).
H. D. Scott.
U.S. Patent No 4,191,884, 7 p, 6 Fig, 3 Ref; Official Gazette of the United States Patent Office, Vol 992, No 1, p 317, March 4, 1980.

Descriptors: *Patents, *Borehole geophysics, Geologic formations, Water sources, Salinity, Gamma rays, Aquifer testing.

Gamma ray spectra of earth formation surrounding a well borehole are obtained by bombarding the formations with neutrons from a pulsed neutron source and detecting the gamma rays resulting from capture of thermalized neutrons in the formation using a germanium gamma ray detector. A measure of the ratio of chlorine to hydrogen is obtained from the detected gamma radiation spectra, and the apparent formation water salinity is determined from the chlorine/hydrogen ratio. The water saturation of the formation is then obtained from the apparent formation water salinity and the true formation water salinity. Compensation is made for the presence of saline water in the borehole fluid and in the cement annulus, as well as for any bound water in the formation. (Sinha - OEIS)

GROUND-WATER HYDROLOGY OF THE DADE CITY AREA, PASCO COUNTY, FLORIDA, WITH EMPHASIS ON THE HYDROLOGIC EFFECTS OF PUMPING FROM THE FLORIDAN AQUIFER,
Geological Survey, Tallahassee, FL. Water Resources Div.
C. H. Tribbals, W. Anderson, and C. P. Laughlin.
Geological Survey Water-Resources Investigations 80-33, 1980. 64 p, 34 Fig, 4 Tab, 38 Ref.

Descriptors: *Groundwater, *Hydrogeology, *Deep-well pumping, *Drawdown, *Florida, Water supply, Aquifer characteristics, Water wells, Well data, Groundwater recharge, Potentiometric level, Transmissivity, Storage coefficient, *Pasco County(FL), *Dade City area(FL), *Floridan aquifer.

The Dade City area, northeast Pasco County, Florida, is an area of about 260 square miles. Of the approximately 32 million gallons per day pumped from the Floridan aquifer in the area in 1975, about 16 million gallons per day were pumped from an area of about 0.25 square miles by a citrus processing plant. There are essentially two producing zones in the Floridan aquifer in the Dade City area. The upper zone is from about 10 feet above to about 150 feet below National Geodetic Vertical Datum of 1929, and the lower zone from about 300 to about 500 feet below NGVD of 1929. There is evidence of hydraulic interconnection of the upper and lower zones of the Floridan aquifer. This appears to be highly significant in terms of the geohydrology of the Floridan aquifer in the area, particularly with regard to its ground-water flow pattern, water quality, and aquifer hydraulic characteristics. In the immediate vicinity of the citrus processing plant, aquifer transmissivity may range from 200,000 to as much as 400,000 feet squared per day. It is probable the Floridan is only semiconfined in the immediate vicinity of the citrus processing plant. High aquifer transmissivity in the area is the reason why there are only a few feet of drawdown of the Floridan's potentiometric level even near the center of the well field. (USGS)

4C. Effects On Water Of Man's Non-Water Activities

LEAST COST DESIGN OF URBAN DRAINAGE SYSTEMS,
Purdue Univ., Lafayette, IN. Water Resources Research Center.
J. Han, P. R. Rao, and M. H. Houck.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-131104, Price codes: A07 in paper copy, A01 in microfiche. Technical Report No 138, September 1980. 119 p, 24 Fig, 14 Tab, 39 Ref, 2 Append. OWRT A-056-IND(2).

Descriptors: *Urban drainage, Least cost, *Design criteria, *Drainage systems, Detention reservoirs, *Model studies, Hydrologic model, Urban runoff, Storm runoff, Urban hydrology, Storm drains, Storage capacity, Rainfall-runoff relationships, *Cost analysis.

An urban hydrologic model is developed which will give a least cost design for an urban drainage system. Unlike many of such models, the model reported provides for inflow rates estimated by the use of an adequate performing hydrologic model. A simple, readily usable, and theoretically sound model which includes ILLUDAS and a dynamic programming subroutine has been developed. The model is tested by using data from Upper Ross-Ade and Bar Berry Heights watersheds in West Lafayette, Indiana. The model was used to investigate the variation of systems costs with the variation in design parameters and to optimally size the detention storage volume for the least cost of the system. The least cost drainage design model developed in this study is easy to apply, practical to use, and considerable amounts of information may be easily obtained from the model. The model is helpful to engineers in the design of least cost drainage systems and in the choice of design parameters which are traditionally selected by using engineering judgement. (Wiersma-Ind)
W81-00552

OPTIMAL PARAMETER ESTIMATION AND INVESTIGATION OF OBJECTIVE FUNCTIONS OF URBAN RUNOFF MODELS,
Purdue Univ., Lafayette, IN. Water Resources Research Center.
J. Han, and A. R. Rao.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-131096, Price codes: A08 in paper copy, A01 in microfiche. Technical Report No. 135, September 1980. 153 p, 25 Fig, 54 Tab, 75 Ref. OWRT A-056-IND(1).

Descriptors: *Urban hydrology, *Urban runoff, *Rainfall-runoff relationships, *Model studies, Hydrologic models, Linear programming, Optimization, Least squares method.

This report deals with improvements of urban hydrologic models. Two areas are considered, namely; the optimal estimation of parameters, and the selection of an objective function to produce the best results. Three urban runoff models, ILLUDAS, SWMM and MINNOUR were studied and results showed that the optimal parameter estimates gave better regeneration and prediction performances than cases where the parameters were arbitrarily specified. Another result was that the complexity of the model structure did not guarantee better performance. Two sets of the objective functions were tested by using the data from the Upper Ross-Ade (West Lafayette, Ind.) and the Oakdale Avenue (Chicago) watersheds. The sum of the squared deviations between the observed and the calculated hydrograph ordinates has been the most frequently used objective function in the past and the results of the present study show that this gives the best overall performance. (Wiersma-Ind)

EFFECTS OF BANK STABILIZATION ON THE PHYSICAL AND CHEMICAL CHARACTERISTICS OF STREAMS AND SMALL RIVERS: AN ANNOTATED BIBLIOGRAPHY,
Missouri Univ., Kansas City. Dept. of Biology.
D. H. Stern, and M. S. Stern.
Fish and Wildlife Service, Biological Services Program, Report FWS/OBS-80/12, July 1980. 84 p, 213 Ref. 14-16-0009-78-035.

Descriptors: *Bibliographies, *Bank stabilization, *Water quality, Streams, Rivers, Water chemistry, Channels, Erosion, Ecology, Beds, Wildlife, Vegetation, Velocity, Stream improvement, Water temperature.

This annotated bibliography provides a reference source of information on the impacts of bank stabilization on the physical and chemical characteristics of streams and small rivers. The bibliography has 213 references, and is indexed by key subject headings, including the following: bed material, channel configuration, channelization impacts, coastal areas, construction, depth and stage, dissolved substances, ecology, erosion, fauna, flow variability, surface area, surveys, suspended solids, techniques, temperature, vegetation, and velocity. Many of the annotations provide a thorough summary of pertinent information contained in the respective references. (Moore - SRC)

EFFECTS OF BANK STABILIZATION ON THE PHYSICAL AND CHEMICAL CHARACTERISTICS OF STREAMS AND SMALL RIVERS: A SYNTHESIS,
Missouri Univ., Kansas City. Dept. of Biology.
D. H. Stern, and M. S. Stern.
Available from Supt. of Documents, GPO, Washington, DC 20402. Fish and Wildlife Service, Bio-

logical Services Program, Report FWS/OBS-80/11, July 1980. 50 p, 109 Ref. 14-16-0009-78-035.

Descriptors: *Bank stabilization, *Water quality, Streams, Rivers, Water chemistry, Channels, Erosion, Ecology, Beds, Water temperature, Velocity, Stream improvement.

This report is a synthesis of available literature relating the effects of bank stabilization to the physical and chemical characteristics of streams. Depth and stage, water surface area of channel and floodplain, channel configuration, water current velocity, water temperature, suspended solids, bed materials, bedload, dissolvd substances, light transmissivity, and flow variability are discussed. Stream management should be confined to the shortest possible length of stream and employ the least amount of artificiality. (Moore - SRC)

AUTOMATED DISTILLATION-SPECTOPHOTOMETRY PROCEDURE FOR DETERMINING AMMONIA IN WATER,
Ontario Ministry of the Environment, Rexdale, Water Quality Branch.
J. Crowther, and J. Evans.
Analyst, Vol 105, No 1254, p 841-848, September, 1980. 3 Fig, 3 Tab, 8 Ref.

Descriptors: *Ammonia, *Surface waters, *Spectrophotometry, *Automation, *Distillation, Nitrogen compounds, Industrial wastes, Separation techniques, Pollutant identification, Hydrogen ion concentration, Temperature, Waste water treatment, Analytical techniques, Color, Water pollution sources, Water analysis, Turbidity.

The automation of the distillation pretreatment procedure for the analysis of ammonia in waste water by spectrophotometry is described. A Technicon AutoAnalyzer was modified for the distillation of ammonia using either a phosphate (pH 7.4) or a borate (pH 9.5) buffer. Ammonia recovery depended on the pH of the distillation but was reproducible for both buffers. Both buffers allowed 95% recoveries of added ammonia from solutions of 55 test compounds. However, the system buffered to pH 9.4 was 1.4 times more sensitive than that buffered to pH 7.4. Less than 0.5% hydrolysis of 24 organic nitrogen contaminants occurred with both of the buffers. Formation of blockages in the distillation coils was encountered in the heating bath, but this was overcome by adjusting the temperature and flow rates to prevent formation of precipitates. The inefficiency of the partitioning of ammonia from the gas-liquid stream mixture into the re-sample stream was overcome by replacing the commercial distillation heads with a gas-liquid separator developed in-house. The effects of distillation temperature, hydrochloric acid concentrations, pH, and interfering pollutants on the system were also examined. Optimum temperature for the heat bath was found to be 112C for flow rates of 0.32-3.40 mL/min. Lead, some volatile organics (e.g., formaldehyde), and some organic nitrogen compounds interfered with the method. The technique was deemed suitable for the analysis of highly colored and/or turbid surface waters with possible application to grossly polluted industrial waste waters with added buffering. (Geiger-FRC)
W81-00576

BLANKING SYSTEM FOR THE SPECTROPHOTOMETRIC DETERMINATION OF AMMONIA IN SURFACE WATERS,
Ontario Ministry of the Environment, Rexdale. Water Quality Branch.
J. Crowther, and J. Evans.
Analyst, Vol 105, No 1254, p 849-854, September, 1980. 2 Fig, 6 Tab, 4 Ref.

Descriptors: *Spectrophotometry, *Ammonia, *Surface waters, *Automation, Analytical techniques, Nitrogen compounds, Laboratory tests, Colorimetry, Color reactions, Pollutant identification, Humic acids, Colbalt, Nitrates, Sulfides, Water analysis, Water Pollution sources.

A blanking system to be used in conjunction with automated spectrophotometry for the determination of low levels of ammonia in surface waters is described. A Technicon AutoAnalyzer was set up with dual flow cells for determinations of ammonia by a variation of the phenate-hypochlorite procedure and was used for analysis of ammonium chloride standards and suface water samples. The reference stream contained an equal flow of water in place of the nitroprusside catalyst that was used in the color-forming stream. The calibration was linear to within 0.001 mg/liter as nitrogen. The mean standard deviation for duplicate analyses of routine samples was 0.0023 mg/liter as nitrogen for ammonia levels $<$ 0.080 mg/liter as nitrogen. Comparisons of results from blanking system analyses and an automated distillation spectrophotometric procedure gave correlations over 99.9%, with values being about 1% lower in the blanking technique. The blanking system experienced interference by high levels of cobalt (II, 2 mg/liter), nitrate (50 mg/liter as nitrogen), sulfide, and tannic and humic acids. These interferences should be taken into account before the blanking system is substituted for the distillation pretreatment step. (Geiger-FRC)
W81-00598

EXCHANGE OF COMMENTS ON SCHEME FOR CLASSIFICATION OF HEAVY METAL SPECIES IN NATURAL WATERS,
Colorado State Univ., Fort Collins. Dept. of Chemistry.
R. K. Skogerboe, S. A. Wilson, J. G. Osteryoung, T. M. Florence, and G. E. Batley.
Analytical Chemistry, Vol 52, No 12, p 1960-1963, October, 1980. 2 Tab, 23 Ref.

Descriptors: *Water analysis, *Heavy metals, *Thermodynamic behavior, *Speciation, Analytical techniques, Chemical analysis, Equilibrium, Chemical reactions, Mercury, Hydrogen ion concentration, Pollutant identification.

The trace metal speciation scheme for heavy metals in natural waters developed by Batley and Florence is discussed. The scheme is based on behavioral differences and identifies four classes of metals. It is suggested that the terms 'labile' and 'nonlabile' produce confusion, because the time lapse between sample treatment and analysis as well as the duration of the analysis itself may affect the ability to discriminate between labile and nonlabile metals. Thermodynamic or kinetic stability can also influence the results. The adjustment of pH can affect the degree of ionization and metal binding, causing a significant shift in relevant complexation equilibria. The addition of acetate can sharply shift metal-ligand equilibria even when the formation constants for the competing ligand systems are considerably higher than those of the metal-acetate systems. Addition of mercury can displace metals form their ligands. It is suggested that such equilibrium shifts and validation models be added to the scheme. In reply to the discussion, Florence and Batley emphasize that, in their scheme, results are operationally defined and do not necessarily reflect true equilibrium concentrations. It should not be assumed that the original equilibrium species concentrations will be obtained if mercury and acetate are omitted and pH is not altered. Florence and Batley are now developing a speciation scheme using a thiol complexing resin which is equilibrated with the sample at the original pH. (Titus-FRC)

INTERLABORATORY COMPARISON OF DETERMINATIONS OF TRACE LEVEL HYDROCARBONS IN MUSSELS,
National Bureau of Standards, Washington, DC. Organic Analytical Research Div.
S. A. Wise, S. N. Chesler, F. R. Guenther, H. S. Hertz, and L. R. Hilpert.
Analytical Chemistry, Vol 52, No 12, p 1828-1833, October, 1980. 1 Fig, 3 Tab, 16 Ref.

Descriptors: *Laboratory tests, *Bioindicators, *Water analysis, Water pollution, Fossil fuels, Gas chromatography, Variability, Oil pollution, Mussels, Monitoring, Analytical techniques, Laboratories, Organic compounds, Sampling.

The current use of mussels as a bioindicator of water pollution by fossil fuel hydrocarbons has necessitated the establishment of baseline data for comparison among laboratories dealing with the monitoring of marine environments by these organisms. Eight laboratories participated in analyses of hydrocarbons in two species of mussels collected from the waters of Simpson Bay, Alaska and from waters affected by natural oil seeps near Santa Barbara, California. Tissue homogenates of Mytilus edulis and Mytilus californianus were analyzed with no prescribed protocol by the laboratories so that results would reflect the variability of currently generated environmental measurements. Seven of the eight laboratories used column chromatography for the separation of trace hydrocarbons while one laboratory used liquid chromatography. All eight laboratories used gas chromatography for hydrocarbon analyses with various internal standards and methods for quantification and identification. Values for levels of total extractable hydrocarbons, total hydrocarbons in the gas chromatographic elution range and individual hydrocarbon compounds generally differed by less than a factor of four. Inhomogeneity of samples, analysis uncertainty and instability of sample storage over a period of nine months all contributed to an observed interlaboratory precision of plus or minus 40%. THE ESTIMATION OF ARSENIC CONCENTRATIONS IN SEWAGE SLUDGES FROM THE LOTHIAN REGION,
Lothian Regional Council, Edinburgh (Scotland). Dept. of Drainage.
J. Webster.
Water Pollution Control, Vol 79, No 3, p 405-412, 1980. 4 Fig, 5 Tab, 10 Ref.

Descriptors: *Sewage sludge, *Chemical analysis, *Arsenic, *Atomic absorption spectrophotometry, Water polllution, Spectrophotometry, Analytical techniques, Industrial wastes, Domestic wastes, Sludge disposal, Sludge digestion, Pollutant identification.

The investigation of a sensitive, rapid, and inexpensive method for the determination of low concentrations of arsenic in sewage sludge is reported. This method uses sludge that has been digested using nitric/perchloric acid being pipetted into the reduction cell followed by the addition of borohydride. The liberated arsine is carried by a stream of nitrogen from the cell to a silica furnace, maintained at dull-red heat by the air-acetylene flame of an atomic absorption spectrophotometer. This procedure was not capable of great precision or accuracy; for sludge carried through the whole procedure the coefficient of variation was from about 50-90%. In view of these difficulties, a more accurate method is certainly required by water pollution laboratories for sludge samples, although this method would probably be suitable for river or sewage effluent samples. GC/MS IDENTIFICATION OF TRACE ORGANICS IN PHILADELPHIA DRINKING WATERS DURING A 2-YEAR PERIOD,
Drexel Univ., Philadelphia, PA. Dept. of Chemistry.
I. H. Suffet, L. Brenner, and P. R. Cairo.
Water Research, Vol 14, No 7, p 853-867, July, 1980. 4 Fig, 4 Tab, 24 Ref.

Descriptors: *Potable water, *Organic compounds, *Gas chromatography, *Mass spectrometry, Impaired water quality, Separation techniques, Chemistry, Solvent extractions, Water analysis, Pollutant identification, Analytical technqiues, Industrial wastes, Aromatic compounds, Water quality.

This report describes gas chromatography with mass spectrometry (GC/MS) analyses of trace organic constituents found in Philadelphia drinking water from February 1975 to January 1977. Continuous on-line sampling techniques utilizing macroreticular resin and liquid-liquid extractor followed by GC/MS analyses isolated 138 organic compounds, 41 of which are on the EPA revised list of priority pollutants. Isolated compounds fell within five general classes: halogenated aromatic and halogenated aliphatic, other aromatics, other aliphatics, phthalate esters, and miscellaneous. Using computer reconstructed plots of GC profiles, the high variability of these compounds was evident by superimposing plots from successive weeks on top of one another. This high variability of organic compounds with time is indicative of a watershed with numerous industrial discharges. A comparison was made between the results presented in this report with others who have sampled Philadelphia drinking water during this two-year time period. (McKeon-FRC)

COMPARISON OF THE TOXICITY THRESHOLDS OF WATER POLLUTANTS TO BACTERIA, ALGAE, AND PROTOZOA IN THE CELL MULTIPLICATION INHIBITION TEST,
Bundesgesundheitsamt, Berlin (Germany, F.R.). Inst. fuer Wasser-, Boden-, und Lufthygiene.
G. Bringmann, and R. Kuhn.
Water Research, Vol 14, No 3, p 231-241, March, 1980. 10 Tab.

Descriptors: *Bioindicators, *Pollutant identification, *Aquatic algae, *Aquatic bacteria, *Protozoa, Toxicity, Environmental effects, Inorganic compounds, Aromatic compounds, Nitrogen compounds, Pseudomonas, Aquatic animals, Alcohols, Water pollution effects, Model studies, Chlorinated hydrocarbon pesticides, Monitoring, Pollutants, Scenedesmus, Self-purification, Aquatic microorganisms, Pesticides, Organic acids, Organic compounds.

In order for an organism to be used as a test organism in studies of water toxicology, its ecological and physiological requirements must be known. In addition, the model organism must provide early indications of potential water pollution that are easily detectable to the toxicologist. Analogous methods of the cell multiplication inhibition test were used to determine the toxicity threshold (TT) of 156 potential water pollutants for model organisms of biological self purification. Various inorganic compounds and organic chemicals including alcohols, aldehydes, ketones, organic acids and their salts, esters, aromatic hydrocarbons, organic nitro-compounds, and organochlorines were tested on a model bacterium, algae, and protozoa. Of the 156 inorganic and organic pollutants tested, 23 exhibited a pronounced selective toxicity to bacteria, Pseudomonas putida, 46 to algae, Scenedesmus quadricauda, and 43 to flagellate protozoa, Entosiphon sulcatum. It was concluded that determination of TT of potential water pollutants for three rather than one model organism from the microbiological spectrum would give a broader basis for assessing the environmental effects of water pollutants. METHODS FOR DETECTION OF VIRUS IN WASTEWATER, APPLIED TO SAMPLES FROM SMALL SCALE TREATMENT SYSTEMS,
Royal Veterinary and Agriculture Coll., Copenhagen (Denmark). Dept. of Veterinary Virology and Immunology.
B. Lydholm, and A. L. Nielsen.
Water Research, Vol 14, No 2, p 169-173, February, 1980. 2 Tab, 15 Ref.

Descriptors: *Waste water treatment, *Viruses, *Pollutant identification, Domestic wastes, Sewage, Disinfection, Chemical precipitation, Heat treatment, Sewage treatment.

The effect of two small scale wastewater treatment systems on indigenous viruses in effluent from an emscher tank system serving a school in Denmark was examined. The emscher tank treatd a mixture of outlets from toilet, bath and kitchen. Viruses were consistently found from all three sources. At a pasteurization plant where outlets from toilets were treated by formaldehyde and heating to 76C for 30 minutes, a few samples from the influent were positive but no viruses were detected in the effluent. Four different methods of detecting viruses in wastewater were compared. Alum precipitation and acidic precipitation gave various degrees of virus detection depending on the amount of precipitate. With a two-phase separation technique, the lowest detectable virus concentration was 0.05 TCID50/ml of wastewater. When direct inoculation was used, none of the samples tested suggested the presence of viruses in blind passages. No differences were found in the efficiency of viral detection between the precipitation of two-phase concentration methods. The wastewater treatment operations of the pasteurization plant examined in this study seemed adequate for control of harmful viruses. (Geiger-FRC)

VARIABLE SOURCES OF SUSPENDED SEDIMENT AND NUTRIENTS FROM SMALL WATERSHEDS,
Max C. Fleischmann Coll. of Agriculture, Reno, NV.
M. H. Lohrey.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-132425, Price codes: A04 in paper copy, A01 in michrofiche. Water Resources Center, University of Nevada, Publication No 43006, 1977. 62 p, 3 Fig, 1 Tab, 29 Ref, 4 Append. OWRT-A-072-NEV(1), 14-31-0001-6029.

Descriptors: *Sediment transport, *Sediment yield, *Nutrients, *Small watersheds, Watersheds(Basins), Chemical properties, Water quality, Streamflow, Channel morphology, Path of pollutants, *Nevada.

A stream channel classification procedure was developed to delineate and characterize the channel networks of watersheds in terms of factors affecting production of fluvial sediment and nutrients. The procedure was applied to 10 small watersheds in the east-central Sierra Nevada where yield of suspended sediment and nutrients (notably nitrate nitrogen, organic nitrogen, and orthophosphate) had been measured during the snowmelt period. The relationship and significance of these channel characteristics to the yield of the above parameters was tested with multiple regression techniques. Although the classification procedure was shown to be significant, length of ephemeral channels and flow proved to be the most important variables to the production of suspended sediment and nitrate nitrogen. However, channel characteristics did not prove to have a significant effect on production of organic nitrogen and orthophosphate. Predictive equations were developed for susepended sediment and nitrate nitrogen, but because of the limited number of observations (10), more research is necessary before the equations can be successfully utilized by the land.

WATER QUALITY OF TAMPA BAY, FLORIDA: JUNE 1972 - MAY 1976,
Geological Survey, Tallahassee, FL. Water Resources Div.
C. L. Goetz, and C. R. Goodwin.
Geological Survey Water-Resources Investigations 80-12, 1980. 49 p, 36 Fig, 4 Tab, 24 Ref.

Descriptors: *Water quality, *Bays, *Florida, *Chemical properties, Nutrients, Metals, Physical properties, Sampling, Sites, Data collections, *Tampa Bay(FL).

A comprehensive assessment of the water quality of Tampa Bay, Florida, was initiated in 1970 to provide background information to evaluate the effects of widening and deepening the ship channel to the port of Tampa. This report provides results of water-quality sampling in the bay from 1972 to 1976, prior to dredging. Measurements of temperature, dissolved oxygen, pH, turbidity, specific conductance, biochemical oxygen demand, and total organic carbon were made as well as measurements for several nutrient, metal, and pesticide parameters. Many parameters were measured at as many as three points in the vertical. These data indicate that Tampa Bay is well-mixed vertically with little density stratification. Time histories of average temperature, dissolved oxygen, pH, turbidity, specific conductance and nutrient values within four subareas of Tampa Bay are given to reveal seasonal or other trends during the period of record. Temperature, dissolved oxygen, pH, turbidity, specific conductance, nutrient, biochemical oxygen demand, total organic carbon, and metal data are also presented as areal distributions. Nutrient concentrations were generally higher in Hillsborough Bay than in other sub-areas of Tampa Bay. Biochemical oxygen demand, total organic carbon, and total organic nitrogen distribution patterns show regions of highest concentrations to be

along bay shorelines near population centers. Of the metals analyzed, all were present in concentrations of less than 1 milligram per liter. (USGS)

CONDENSED REPORT ON THE USE OF ENZYMATIC CYCLING FOR HIGH SPECIFICITY AND PRECISION IN THE COLORIMETRIC ANALYSIS OF AMMONIA,
American Univ., Washington, DC. Dept. of Chemistry.
F. W. Carson, and H. W. Davies.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-137937, Price codes: A03 in paper copy, A01 in microfiche. Water Resources Research Center, University of the District of Columbia, Washington, DC. Final Report, October 1980. 30 p, 2 Fig, 44 Ref. OWRT-B-009-DC(2), 14-34-0001-807.

Descriptors: *Ammonia, *Ammonium compounds, *Enzymes, *Analytical techniques, *Assay, Chemical analysis, Testing procedures, Nitrogen compounds, Organic compounds, Catalysts, Biochemistry, Colorimetry, Spectrophotometry, Instrumentation, Laboratory test, Nutrients, Inorganic compounds, Nutrient removal, Measurement, Water measurement, Evaluation, Testing, Water pollution.

A new method is reported for the colorimetric determination of ammonia in water, based on enzymatic cycling using the ammonia-specific glutamate dehydrogenase reaction followed by an enzymatic cycling reaction that provided controlled amplification of the response to ammonium ion. The cycling reaction product (a tetrazolium formazan) had a conveniently-measured visible absorption maximum at 600 nm. With the established procedure, absorbance versus original ammonium ion concentration plots were linear (correlation coefficients: 0.997-0.9998). The new method was simple and precise in the range of 0.0001-0.00001 molar ammonia concentrations. The sensitivity could be extended well below the ten nanomole per sample determination limit of the assay procedure described, using suitable modifications of the procedure. The coefficient of variation was 2% for a series of replicate measurements on samples containing 0.0000441 molar ammonium ion. A calibration curve for the determination of unknown concentrations could be constructed by carrying standard solutions through the procedure. The method only required the use of volumetric equipment and a spectrophotometer or colorimeter. Analysis time per sample was three hours, and all solutions could be prepared in advance and used for at least two weeks. (Zielinski-IPA)

EUTROPHICATION IN PEEL INLET-I. THE PROBLEM-DEFINING BEHAVIOR AND A MATHEMATICAL MODEL FOR THE PHOSPHORUS SCENARIO,
Virginia Univ., Charlottesville. Dept. of Environmental Sciences.
G. M. Hornberger, and R. C. Spear.
Water Research, Vol 14, No 1, p 29-42, January, 1980. 6 Fig, 1 Tab, 51 Ref.

Descriptors: *Eutrophication, *Model studies, *Phosphorus, *Inlets, *Cladophora, Nutrients, Connate water, Nitrogen, Theoretical analysis, Simulation analysis, Monte Carlo method, Nuisance algae, Phytoplankton, Sediments, Photosynthesis, Biomass, Australia, Mathematical models, Computer models, Statistical methods, Peel Inlet.

To attack the problems of excessive algal growth in Peel Inlet, Western Australia, a simulated model assuming phosphorus to be the causitive element was examined. The alga in question was Cladophora aff. battersii. The factors which in reality have caused excessive algal growth are still uncertain, but it was hoped that a simulation model specifying a priori statistical distributions based on data from other euthrophied water systems would provide information or suggest new hypotheses during experimentation. A Monte Carlo approach was used for the model, which consisted of four compartments: Cladophora, phytoplankton, soluble phosphorus in the water column, and sediment (layer of decomposing material underlying much of the photosynthesizing Cladophora mat). Parameters considered included temperature-light growth coefficient, loss rate, and half-saturation content for Cladophora and phytoplankton, Cladophora maximum photosynthesis biomass, sediment-water diffusion and maximum sediment concentration, Cladophora and phytoplankton loss to sediment, groundwater concentration, tidal exchange efficiency parameter, and river sediment-phosphorus coefficient. A total of 626 simulation tests were done using the phosphorus scenario, and results indicate that this approach was amenable to the study of eutrophication by algae at the inlet. The feasibility of applying a nitrogen scenario to this particular problem is still being investigated. (Geiger-FRC)

THE USE OF HYDROBIA JENKINSI TO DETECT INTERMITTENT TOXIC DISCHARGES TO A RIVER,
Plymouth Polytechnic (England). Dept. of Environmental Sciences.
L. Brown.
Water Research, Vol 14, No 8, p 941-947, August, 1980. 1 Fig, 5 Tab, 15 Ref.

Descriptors: *Bioassay, *Dieldrin, *Heavy metals, *Gastropods, *Bioindicators, Chlorinated hydrocarbon pesticides, Chromium, Copper, Rivers, Toxicity, On-site tests, Laboratory tests, Water pollution sources, Industrial wastes, Textiles, River Holme, *England.

River pollution in the Holme, Yorkshire, England and its tributaries was monitored from October 1975 to October 1977 using an in situ bioassay with the operculate gastropod Hydrobia jenkinsi. Effluents containing toxic textile axcillary chemicals such as pesticides like dieldrin and heavy metals (copper and trivalent and hexavalent chromium) are discharged into the Holme. River samples artificially spiked with dieldrin or heavy metals were used in laboratory tests to assess survival rates of the gastropod to known levels of toxins. Close correlations were noted between laboratory toxicity test responses and those found when H. jenkinsi was exposed to polluted river water samples. When caged H. jenkinsi were exposed in situ to water from pollutant discharge sites along the waterways, gastropod responses made it possible to detect when discharges were contaminated with certain heavy metals, especially copper and hexavalent chromium. In situ death was not due solely to dieldrin or heavy metals. At levels in excess of 30,000 nanograms/liter, dieldrin failed to produce a toxic response in H. jenkinsi, suggesting the need for an organism susceptible to pesticides as an indicator for river pollution by this organochlorine compound. SENSORY PROPERTIES AND ANALYSIS OF TWO MUDDY ODOUR COMPOUNDS, GEOSMIN AND 2-METHYLISOBORNEOL, IN WATER AND FISH,
Helsinki Univ. (Finland). Dept. of Limnology.
P. Persson.
Water Research, Vol 14, No 8, p 1113-1118, August, 1980. 4 Fig, 2 Tab, 49 Ref.

Descriptors: *Water quality, *Fish, *Odor, *Actinomycetes, Soil microorganisms, Organoleptic properties, Impaired water quality, Cyanophyta, Potable water, Rainbow trout, Pikes.

The sensory properties of geosmin and 2-methylisoborneol (MIB) in water and in the flesh of four species of fish were studied. Threshold odor concentrations indicate that both compounds have strong odor characteristics. Sensory panels were able to discriminate between geosmin and MIB down to 0.05 ppb. The sensitivity of the human nose still exceeds the sensitivity of chemical methods used for the analysis of these muddy odor compounds. The perceived intensities of geosmin and MIB by the sensory panels were proportional to the logarithm of the concentration of muddy odor compounds in the concentration ranges tested (for geosmin, up to 100 ppb, and for MIB, up to 10 ppb). The quantification of muddy odor compounds in water and fish by sensory methods may be possible, according to the results presented. (McKeon-FRC)

THE STABILITY OF BOVINE PARVOVIRUS AND ITS POSSIBLE USE AS AN INDICATOR FOR THE PERSISTENCE OF ENTERIC VIRUSES,
Royal Veterinary and Agriculture Coll., Copenhagen (Denmark). Dept. of Veterinary Virology and Immunology.
R. N. Srivastava, and E. Lund.
Water Research, Vol 14, No 8, p 1017-1021, August, 1980. 3 Tab, 14 Ref.

Descriptors: *Viruses, *Farm wastes, *Waste disposal, *Cultures, Public health, Human diseases, Wastes, Microbiology, Organic wastes, Domestic animals.

The suitability of the bovine parvovirus 1 (Haden virus) for use as an indicator of bovine enteric viruses was studied; the rates of its inactivation in liquid manure are reported. Calf kidney cell cultures, 0-24 hr old, were suitable for parvovirus studies and demonstrated a pronounced cytopathic effect. The virus' rate of inactivation (time in min for a 1 log unit reduction in titer) at 60, 70, and 80C was 360, 72, and 16 min. When the virus was seeded in liquid manure it became inactivated at a rate of around 6-8 days for 1 log unit under aerobic conditions at 5-20C. Inactivation under anaerobic conditions was highly temperature dependent: at 5C it took 188 days to decrease the titer 1 log unit, but at 20C it took only 20 days to reduce the titer 1 log unit. It is suggested that these parvoviruses may also be useful as indicators for human enteric viruses, e.g., infectious hepatitis virus. (McKeon-FRC)

5B. Sources Of Pollution

REMOVAL OF TRACE METALS FROM SEDIMENTS UNDER CHEMICO-OSMOTIC GRADIENTS,
Rhode Island Univ., Kingston.
V. A. Nacci.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-127409, Price codes: A03 in paper copy, A01 in microfiche. Technical Completion Report, 1980, 33 p, 9 Fig, 2 Tab, 14 Ref. OWRT-A-070-RI(1), 14-0001-34-0142.

Descriptors: *Trace metals, *Sediments, *Self purification, *Ion transport, *Diffusion, Soils, Clay minerals, Water pollution, Geophysics, Heavy metals, Chemical reactions, Pore water, Porosity, Flow.

The investigation of the process in which a sediment will depollute itself under a chemico-osmotic gradient is presented in regards to both a theoretical and experimental approach. A system was designed utilizing electrical conductivity methods to determine the time rate of the diffusional process. This was in turn compared to theory based on irreversible thermodynamics and Terzaghi's theory on consolidation. The diffusivity measured through means outlined in this study was then shown to be reflective of the sediment properties. Once the diffusivity had been measured it was possible to obtain a 'time estimate' for depolluting these sediments.

CHLORINATED PARAFFINS AND THE ENVIRONMENT. 1. ENVIRONMENTAL OCCURRENCE,
Imperial Chemical Industries Ltd., Runcorn (England). Mond Div.
I. Campbell, and G. McConnell.
Environmental Science and Technology, Vol 14, No 10, p 1209-1214, October, 1980. 3 Fig, 6 Tab, 4 Ref.

Descriptors: *Pollutants, *Chlorinated paraffins, *Water pollution, Sediments, Aquatic life, Pikes, Mussels, Water birds, Food chains, Fish, Benthos, Path of pollutants, Water quality, Bird eggs, Foods.

The aim of this study was to measure the distribution and persistence of chlorinated paraffins (CP) in the environment, to determine their pathways through the environment, and to measure their concentrations in animal and vegetable life. Because CP are involatile, their transport by moving water is probably the only large-scale dispersion mechanism available to the product. However, half the waters studied (industrialized waterways and marine and fresh water remote from industry) showed C10-20 CP at 0.5-4 0 ppb, and less than half showed C20-30 CP at 0.5-2.0 ppb. CPs were seen in only a few sediments, at up to 0.5 ppm. C20-30 CP was almost absent from aquatic organisms, and C10-20 CP was present only at low levels. The median concentration distribution in seabirds' eggs was 0.2 ppm of C10-20 CP; C20-30 CP was almost absent. Mean CP levels in dairy/oil foods were higher (0.15-0.3 ppm) than in fruit/vegetables and beverages (0-0.025 ppm). Low levels of CP were detected in at least one human tissue from every subject tested. The total body burden of CP was estimated to be in the range 0-7 mg with an average of 2.3 mg. This quantity is not expected to pose a health hazard to man. There was no indication of biomagnification in any food chain, aquatic or on land, including the human food chain. 243,244-CM IN COLUMBIA RIVER SEDIMENTS,
Oregon State Univ., Newport. Marine Science Center.
T. M. Beasley, and L. A. Ball.
Nature (London), Vol 287, No 5783, p 624-625, 16 October, 1980. 1 Tab, 8 Ref.

Descriptors: *Reservoirs, *Nuclear wastes, *Cores, *Columbia River, Lichens, Sediments, Water pollution sources, Movement, Mass spectrometry, Radioactive wastes, Sampling, Soil erosion, Radioisotopes, Fallout, Deposition(Sediments), Sediment transport.

Data derived from a sediment core sample taken from McNary reservoir in Washington State in August 1977 have shown the presence of 244-Cm in lichens as a result of the testing of nuclear devices. McNary reservoir lies about 100 km downstream from the Hanford Reservation in Washington State and contains accumulations of sedimentary materials transported by the Columbia River. Samples taken from the reservoir prior to 1961 were not analyzed for curium isotope production which could have occurred during nuclear testing from 1952 to 1958. Analyses for 239,240-Pu and 241-Am in Columbia River sediments demonstratd that activity resulting from testing was 1 to 3% that of 239,240-Pu. Mass spectrometry results have indicated that 25% of the 239,240-Pu radioactivity in McNary reservoir was derived from plutonium reactors on the Hanford Reservation. However, it was concluded that the 243,244-Cm found in this study was derived entirely from fallout. It was suggested that erosion processes on the land have mobilized and concentrated material containing radioactive curium in the river where they were subsequently sedimented. (Geiger-FRC)

PERSISTENCE OF 12 INSECTICIDES IN WATER,
Malaysian Agricultural Research and Development Inst., Selangor.
M. S. Sharom, J. R. W. Miles, C. R. Harris, and F. L. McEwen.
Water Research, Vol 14, No 8, p 1089-1093, August, 1980. 4 Fig, 1 Tab, 24 Ref.

Descriptors: *Persistence, *Microbial degradation, *Insecticides, *Pesticide kinetics, Path of pollutants, Aquatic microorganisms, Chlorinated hydrocarbon pesticides, Organophosphorus pesticides, Carbamate pesticides, Natural streams, Biodegradation, Water pollution sources, Pesticides, DDT, Dieldrin, Diazinon, Chemical degradation.

The persistence of 12 insecticides representing organochlorine, organophosphorus, and carbamate compounds was measured in distilled and natural water to evaluate the role of microbial degradation of insecticides in the aquatic environment. Four types of water were used: natural, distilled, sterlized natural, and sterilized distilled. Concentrations of insecticides used were 5 ppm for carbaryl, carbofuran, chlorphrifos, diazinon, ethion, leptophos, and parathion, 10 ppm for mevinphos, and 0.1 ppm for DDT. Rapid disappearance was observed for DDT, lindane, and parathion in natural water, but these same compounds were persistent in the other liquids, indicating the importance of microorganisms in their degradation. Little evidence of chemical decomposition of organochlorine insecticides was observed. Dieldrin, endrin, ethion and leptophos were the most stable compounds in water. In general, the other organophosphorus compounds and the carbamate insecticides were degraded in all four aqueous test systems, indicating the importance of chemical factors in their decomposition. Biological processes played a secondary role in the degradation of chlorphyrifos, diazinon, and carbaryl. After 8 wk in natural waters, dieldrin was the most persistent and parathion the least peristent of all the compounds tested. No evidence was found of persistnce based on chemical structure of the insecticides. (Geiger-FRC)

RVRFLO: A HYDRAULIC SIMULATOR OF WATER QUALITY IN THE HOUSATONIC RIVER IN CONNECTICUT,
Connecticut Agricultural Experiment Station, New Haven.
D. E. Aylor, and C. R. Frink.
Bulletin 780, April 1980. 53 p, 30 Fig, 8 Tab, 48 Ref, 2 Append.

Descriptors: *Connecticut, *Water quality, *River flow, Rivers, *Hydraulic similitude, *Simulaltion analysis, Phosphorus, Chlorine, Polychorinated biphenyls, Nitrogen, Impoundments, Water pollution control, Water pollution sources, Advection, Computer models, *Housatonic River(CT).

The Housatonic River has long received pollutants from municipal and industrial discharges, as well as runoff from forests and fields. The author's goal was to develop a computer simulation model to predict seasonal losses or gains of nutrients or other pollutants in the river. The results suggest strategies for controlling some of the pollutants, such as scaling down tertiary treatment operations, reducing water quality monitoring stations for more efficiency, and limiting phosphorus inputs during certain seasons. The model appears to provide reliable predictions of conservative elements, such as chlorine, and to provide a means of calculating the attenuation of non-conservative elements such as phosphorus and nitrogen. The model, called RVRFLO, is based on the physical principles of hydraulics and uses measurements of water velocity, temperature, and solute concentration at selected sites on th river as well as weekly mean flow and concentration data for major tributaries. The model accounts directly for three major processes governing the change in concentration of conservative chemicals in rivers: (1) advection or horizontal transport; (2) addition of chemicals by tributaries; and (3) dispersion of chemicals. RVRFLO is written in Fortran. (Garrison-Omniplan)

ANALYSIS OF STREAM QUALITY IN THE YAMPA RIVER BASIN, COLORADO AND WYOMING,
Geological Survey, Lakewood, CO. Water Resources Div.
D. A. Wentz, and T. D. Steele.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-108904, Price codes: A08 in paper copy, A01 in microfiche. Geolgical Survey Water-Resources Investigations 80-8, April 1980. 161 p, 80 Fig, 17 Tab, 59 Ref.

Descriptors: *Water quality, *Streamflow, *Hydrologic data, *Statistical methods, *Water temperature, Regional analysis, Low flow, Water chemistry, Sampling, Sites, Chemical analysis, Trace elements, Bottom sediments, Distribution patterns, Data collections, Computer programs, Time series analysis, Colorado, Wyoming, *Yampa River basin(CO-WY), Harmonic analysis.

Historic data show no significant water-temperature changes since 1951 for the Little Snake or Yampa Rivers, the two major streams of the Yampa River basin in Colorado and Wyoming. Regional analyses indicate that harmonic-mean temperature is negatively correlated with altitude. No change in specific conductance since 1951 was noted for the Little Snake River; however, specific conductance in the Yampa River has increaed 14% since that time and is attributed to increased agricultural and municipal use of water. Site-specific relationships between major inorganic constituents and specific conductance for the Little Snake and Yampa Rivers were similar to regional relationships developed from both historic and recent (1975) data. These relationships provide a means for estimating concentrations of major inorganic constituents from specific conductance, which is easily measured. Trace-element and nutrient data collected from August 1975 through September 1976 at 92 sites in the Yampa River basin indicate that water-quality degradation occurred upstream from 3 sites. The degradation resulted from underground drainage from pyritic materials that probably are associated with coal at one site, discharge from powerplant cooling-tower blowdown water at a second site, and runoff from a small watershed containing a gas field at the third site. Ambient concentrations of dissolved and total iron and manganese frequently exceeded proposed Colorado water-quality standards. The concentrations of many dissolved and total trace elements and nutrients were greatest during March 1976. These were associated with larger suspended-sediment concentrations and smaller pH values than at other times of the year. (USGS)
W81-00660

DISSOLVED-SOLIDS CONCENTRATIONS AND LOADS IN RETURN FLOWS TO THE COLORADO RIVER FROM AGRICULTURAL LAND IN SOUTHERN CALIFORNIA,
Geological Survey, Tacoma, WA. Water Resources Div.
J. M. Klein, and W. L. Bradford.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-105652, Price codes: A04 in paper copy, A01 in microfiche. Geological Survey Water-Resources Investigations 80-52, July, 1980. 54 p, 11 Fig, 3 Tab, 18 Ref.

Descriptors: *Dissolved solids, *Return flow, *Water quality, *Colorado River, *California, Hydrogeology, Salinity, Irrigation water, Chemical analysis, Specific conductivity, Data collections, *Palo Verde Valley(CA), *Fort Mojave area(CA), *Bard Valley(CA).

The dissolved-solids concentration in Colorado River water increases from less than 50 mg/L (milligrams per liter) at the rivers's origin to about 700 mg/L at the California border and to about 900 mg/L at the United States-Mexico boundary. Much of the latter increase is due to depletion by agricultural use and irrigation return water with salts leached from soils under cultivation. Forty sites in three agricultural areas--Fort Mojave, Bard Valley, and Palo Verde Valley--were sampled to describe the dissolved-solids concentrations in return flows. Emphasis was on Palo Verde Valley. In the Fort Mojave area, the dissolved-solids concentration of Colorado River water was about 700 mg/L, while the concentration in water at the tile-drain convergence averaged about 2,500 mg/L. In

the closed sump that presently receives all irrigation return, concentrations ranged from 812 to 1,760 mg/L. In Bard Valley, water diverted from the river had an annual mean dissolved-solids concentration of about 835 mg/L. During the study, concentrations in two main drains carrying irrigation return water ranged from 953 to 1,290 mg/L. Selected drains in Palo Verde Valley were sampled several times to determine dissolved solids loads from subareas within the valley. Loads determined in this study were compared with those of an earlier study. In agreement with the earlier study, loads were found to be largest from three subareas in the southern half of the valley and comparatively small from the four subareas in the northern half. Smaller loads were found in this study from all subareas, however. The differences are thought to be due to generally lower water discharge observed in drains during this study. (USGS)
W81-00664

WATER QUALITY ASPECTS OF COAL TRANSPORTATION BY SLURRY PIPELINE,
Arkansas Univ., Fayetteville. Dept. of Civil Engineering.
J. W. Moore.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-142127, Price codes: A15 in paper copy, A01 in microfiche. Arkansas Water Resources Research Center, University of Arkansas, Project Completion Report, August, 1980. 325 p, 326 Fig, 24 Tab, 8 Ref. OWRT-B-0505-ARK(1), 14-34-0001-6058.

Descriptors: *Coals, *Pipelines, *Water quality, Water use, *Hydraulic transportation, *Slurries, Hydraulic conduits, Hydraulic structures, Pipes, Transportation, Structures, Trace elements, Waste water(Pollution), Alkalinity, Biochemical oxygen demand, Chemical oxygen demand, Suspended solids, Sulfates, Sodium, Hardness(Water), Nitrates, Silica, Conductivity.

Twenty-four batch reactors were designed and constructed for operation in two 12-gang stirring units, equipped with nitrogen purging above the slurry for anaerobic studies (when desired). The research program was designed to: (1) identify and characterize water quality changes during movement of western coal by slurry pipeline; (2) determine feasibility for using impaired quality water (such as municipal/industrial effluents) as slurry medium; and (3) determine tratment measures for restoring water quality of the slurry waste water if needed. Water input quality was varied and four slurry loadings (30, 40, 50, and 60% solids) were used to determine effects of slurry solids concentrations on water quality. Water quality parameters measured included alkalinity, BOD, COD, trace elements, dissolved solids, nitrate, sulfate, pH, silica, specific conductance, and total hardness, dissolved solids, sulfate and sodium would result from slurry pipelining for the western coals studied, with lower concentrations of Al, Pb, Ti, chloride, and nitrate to be expected in slurry waste water. Concentrations of Cr, Cu, Fe, Mn, Hg, Zn and phosphate were not detected. Slurry water quality changes occurred as a function of coal and water sources used. (Zielinski-IPA)

IN-SITU EVALUATION OF THE FILTERING FUNCTION OF A PIEDMONT CREEK SWAMP,
Georgia State Univ., Atlanta. Dept. of Chemistry.
C. H. Wharton, and H. P. Hopkins, Jr.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-142234, Price codes: A04 in paper copy, A01 in microfiche. Environmental Resources Center, Georgia Institute of Technology, Atlanta, Report ERC 02-80, April, 1980. 46 p, 20 Fig, 1 Tab, 13 Ref. OWRT-A-071-GA(1).

Descriptors: *Water quality, *Swamps. *Filtration, *Cycling nutrients, Water flow, Georgia, *Trace elements, Analytical techniques, Aquatic habitats, Wetlands, Wastes, Nutrients, Nutrient removal, Waste assimilative capacity, Research and Development, Metals, Iron, Magnesium, Manganese, Sodium, Zinc, Aluminum, Water pollution sources, Phosphorous, Phosphates, Nitrogen, Ammonia.

A small northern piedmont region swamp in Georgia was monitored for two years, starting in September, 1976, to determine whether swamps might serve as sinks for nutrients and trace metals. Total amounts of phosphorus (orthoposphate, hyrolyzable phosphate, and total phosphate), nitrates, ammonia, and several trace metals (Fe, Mg, Mn, Na, An, Al) flowing into and out of the Cornish Creek Swamp were monitored over the two-year period. The swamp had been formed when a portion of the channellized Cornish Creek was filled up with sand and debris. Since the entrance/exit for the swamp was well-defined, the total amount of water moving through thhe swamp could be established. This information, combined with chemical analysis, allowed calculation of the total amount of chemical nutrients and metal passing through the swamp over the two-year study. Phosphorous, nitrogen and trace metals levels indicated the swamp waters to be pristine. During the majority of study months, total phosphate had a small reduction, and nitrate increased, after the water flowed through the swamp. Large quantities of ammonia left the swamp during Spring. Abnormally high zinc levels reached the swamp from an unknown source, but the swamp effectively reduced the zinc level in the stream. (Zielinski-IPA)
W81-00677

URBAN RUNOFF POLLUTION AND WATER QUALITY PLANNING,
Rutgers- The State Univ., New Brunswick, NJ. Water Resources Research Inst.
W. Whipple, Jr.
Journal of the Technical Councils of the American Society of Civil Engineers, Vol 106, No TC1, Proceedings Paper 15632, p 101-115, August 1980. 7 Fig, 3 Tab, 14 Ref, 1 Append. OWRT A-046-NJ(5) A-048-NJ(8), 14-34-0001-8032, 14-34-0001-9032.

Descriptors: *Water quality, *Urban runoff, *Planning, *Sampling, Sediments, Bed load, Biochemical oxygen demand, Nutrients, Heavy metals, Oil, Storms, Storm runoff, Hydrographs, Flood control, Pollutants, Path of pollutants, Water pollution, Water pollution sources, Streams, Environmental engineering, Hydrology.

Areawide Water Quality Planning under Section 208 of PL 92-500 is supposed to integrate two approaches, first, effluent treatment requirements, and, two, the achieving of stated water quality criteria with control of nonpoint as well as of point sources of pollution. Urban runoff pollution is considered one of the nonpoint sources, although it flows largely through storm and combined sewers. Section 208 planning has been handicapped for lack of adequate data and technology applicable to the highly variable storm flows that characterize urban runoff. Urban runoff pollution includes sediment, BOD, nutrients, heavy metals, and petroleum, most of which occur in particulate form. It is harmful to fish life, but the agents mainly reponsible are usually not identified. Planning of remedial measures requires consideration of both steady state and variable flow modeling. Detention storage for combined purposes of flood control and water quality appears to have some possibilities. (Sims-ISWS)

EUTROPHICATION IN PEEL INLET-II. IDENTIFICATION OF CRITICAL UNCERTAINTIES VIA GENERALIZED SENSITIVITY ANALYSIS,
California Univ., Berkeley. Dept. of Biomedical and Environmental Health Sciences.
R. C. Spear, and G. M. Hornberger.
Water Research, Vol 14, No 1, p 43-49, January, 1980. 2 Fig, 1 Tab, 10 Ref.

Descriptors: *Eutrophication, *Model studies, *Inlets, *Phosphorus, *Cladophora, Nutrients, Connate water, Sediments, Sediment transport, Deposition, Future planning(Projected), Theoretical analysis, Nuisance algae, Phytoplankton, Mathematical studies, Simulation analysis, Australia.

In this follow-up study based on a phosphorus model of cultural eutrophication processes in Peel Inlet, Western Australia, a generalized sensitivity analysis is outlined. The purpose of the analysis was to identify critical uncertainties in the present knowledge of the Peel Inlet system to direct the planning of future research. Results suggested that the nuisance algae Cladophora aff. battersii had access to nutrients from interstitial water in the sediments of the Inlet and from riverborne sediment deposits. From these findings, a recommendation was made to quantify the river input of sediment-bound nutrients as the next area of research and to establish to what extent these nutrients occur in sediments where Cladophora are most prominent. It was also suggested that further in-depth studies be made on Cladophora physiology. (Geiger-FRC)
W81-00726

PSEUDOMONAS AERUGINOSA AND ESCHERICHIA COLI IN SEWAGE AND FRESH WATER,
Dundee Univ. (Scotland). Dept. of Civil Engineering.
D. W. F. Wheater, D. D. Mara, L. Jawad, and J. Oragui.
Water Research, Vol 14, No 7, p 713-721, July, 1980. 3 Fig, 6 Tab, 22 Ref.

Descriptors: *E. coli, *Pseudomonas, *Domestic wastes, *Natural streams, *Sewage, Enteric bacteria, Sewage bacteria, Sewage treatment, Hospitals, Path of pollutants, Water treatment, Water pollution, Water pollution treatment, Freshwater, Rivers, Water pollution sources.

The incidence of Pseudomonas aeruginosa was evaluated along with E. coli as an indicator of fecal pollution in sewage effluent from domestic and hospital sources. P. aeruginosa was consistently found in domestic and hospital sewage at levels usually less than 300,000/100 ml and 500,000/100 ml, respectively. E. coli/P. aeruginosa ratios were normally less than 25 for hospital sewage and over 500 for ordinary domestic sewage. Both bacteria were reduced in number by about 90% after passage of the domestic or hospital effluents through sewage treatment plants, so that after treatment, the E. coli/P. aeruginosa ratios resembled those in the corresponding raw sewage. Calculations of both bacteria were also made from Dighty freshwater stream water and from human and animal fecal specimens. In the freshwater stream samples, P. aeruginosa numbers reflected levels of domestic wastes. Counts of E. coli and P. aeruginosa over the length of the Dighty were similar, except in agricultural areas, where P. aeruginosa was not detected even when E. coli counts were high. These findings were in agreement with results from fecal analysis showing the presence of P. aeruginosa in human samples and the lack of significant numbers of this organism in animal fecal samples. THE MUTAGENIC ACTIVITY IN A SECTION OF THE SHEEP RIVER, ALBERTA RECEIVING A CHLORINATED SEWAGE EFFLUENT,
Calgary Univ. (Alberta). Div. of Pathology.
R. L. Moore, L. L. Osborne, and R. W. Davies.
Water Research, Vol 14, No 7, p 917-920, July, 1980. 3 Fig, 3 Tab, 18 Ref.

Descriptors: *Chlorination, *Mutagens, *Invertebrates, *Sewage effluents, Toxicity, Rivers, Suspended solids, Volatility, Environmental effects, Sewage treatment, Municipal wastes, Benthic fauna.

Studies were conducted to determine if increased mutagenic activity in the water, suspended particulate matter, and benthic macroinvertebrate populations in the Sheep River of Alberta was the result of chlorinated sewage discharge from the Turner Valley municipal sewage treatment plant. Sewage at the facility undergoes secondary treatment followed by chlorination before discharge into the river water. A gas refinery also discharges into the river near the sewage plant. Samples taken from six stations along the river were analyzed for muta-

genicity by the Ames-Salmonella/mammalian microsome mutagenicity test. Total residual chlorine levels at the time of sampling were also determined. Low levels of mutagenic activity were found in water and benthic macroinvertebrate samples, especially from sites where the chlorinated effluents were discharged. Evidence was also found of bioconcentration of chlorine throughout the benthic macroinvertebrate food chain. Due to the extreme volatility of some of the chlorinated compounds, little or no mutagenic activity on the particulate matter would be expected, as was observed. (Geiger-FRC)

MERCURY CONCENTRATIONS IN FISH INHABITING TWO POLLUTED LAKES IN NORTHERN CANADA,
Alberta Environmental Centre, Vegreville.
J. W. Moore, and D. J. Sutherland.
Water Research, Vol 14, No 7, p 903-907, July, 1980. 1 Fig, 1 Tab, 18 Ref.

Descriptors: *Mercury, *Sediments, *Fish, Trout, Pikes, Industrial wastes, Pollutant identification, Water quality, Water pollution, *Lakes, *Canada.

During 1978 and 1977 concentrations of total mercury were determined in the sediments, water and fish of Giauque Lake and Thompson Lake in northern Canada. Mercury laden industrial discharges had previously been permitted to flow into the lakes. In Giauque Lake the trout contained an average of 3.68 mg/kg mercury in their muscle tissue, while average concentrations in northern pike and round whitefish were 1.75 and 1.22 mg/kg, respectively. Mercury levels greater than 500 micrograms/kg were found on about 7% of the lake bottom. In water, the mercury concentrations were below detectable limits, 0.2 microgram/liter. Mercury levels in Thompson Lake northern pike averaged 1.69 mg/kg; in whitefish the highest value was 0.6 mg/kg. Heavy concentrations of mercury in the sediments reached 1300 micrograms/kg. Almost 15% of the lake bottom contained mercury in excess of 500 microgram/kg. It was concluded that northern pike are still accumulating mercury from exposed tailings which were deposited in Thompson Lake about 30 yr ago. It was also concluded that the contamination of only a small part of a lake can result in high pollutant levels in fish throughout the entire lake. (Baker-FRC)

5C. Effects Of Pollution

CONCORDANCE OF HEAVY METAL AND ANTIBIOTIC RESISTANCE ON PLASMIDS OF CHESAPEAKE BAY BACTERIA,
Maryland Univ., College Park. Water Resources Research Center.
L. A. McNicol.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-127532, Price codes: A05 in paper copy, A01 in microfiche. Technical Report No 58, October 1980. 74 p, 7 Fig, 21 Tab, 70 Ref. OWRT-A-048-MD(1), 14-34-0001-9022.

Descriptors: Pollutants, *Water pollution effects, *Chesapeake Bay, *Antibiotics(Pesticides), *Aquatic bacteria, *Heavy metals, *Bioassay, Epidemiology, Toxicity, Water pollution, Bodies of water, Organic compounds, Bactericides, Bacteria, Microorganisms, Bioindicators, Metals, Water pollution sources, Chemical wastes, Lead, Nickel, Cadmium, Mercury, Pollutant identification.

Antibiotic-resistant and heavy metal-resident phenotypic frequency was measured in Chesapeake Bay bacterial strains obtained from Bay sites differing significantly in water quality. The phenotypes were estimated from dose-response curves using direct plating, replica plating, and minimal inhibitory concentration (MIC). Resistant and sensitive organisms could be distinguished by concentrations of twenty micrograms per milliliter for various antibiotics (amphicillin, chloramphenicol, nalidixic acid, penicillin, streptomycin, and tetracycline), and of 0.05 millimolar for the heavy metals tested (cadmium, mercury, nickel, and lead). Individual resistance phenotypes of 1816 isolates were determined with the replica technique, with 85% resistant to at least one antibiotic and a surprising 2% resistant to all six drugs tested. Occurrence of resistant organisms did not correlate with water quality, sampling location, season, sample type, or physical parameters of the site. Ninety-two percent of organisms examined were resistant to at least one metal studied, with 43% resistant to all metals, but resistance did not correlate with any station or sample parameters. Metal and drug resistant phenotypes did correlate positively with one another, but these two traits were not appreciably linked on plasmid DNA. (Zielinski-IPA)

ENVIRONMENTAL ASSESSMENT OF THE ALASKAN CONTINENTAL SHELF: KODIAK INTERIM SYNTHESIS REPORT -- 1980.
Science Applications, Inc., Boulder, CO.
National Oceanic and Atmospheric Administration Report, March 1980. 326 p, 167 Fig, 76 Tab, 565 Ref.

Descriptors: *Alaska, *Environmental effects, *Energy, *Natural gas, *Continental shelf, Leases, Exploitation, Arctic, Subarctic, Geographical regions, Pacific coast region, Regions, Cold regions, Legal aspects, Marine geology, Aquatic life, Water quality, Economic impact, Pollutants, Water pollution, Fisheries.

The Bureau of Land Management requested the National Oceanic and Atmospheric Administration to conduct the Outer Shelf Environmental Assessment Program (OCSEAP), covering several lease areas on the Alaskan Outer Continental Shelf (OCS) from the subarctic Northeast Gulf of Alaska to the arctic Beaufort Sea. Extensive environmental studies must be conducted before OCS area development can safely proceed on oil and gas deposits. The continental shelf east of the Kodiak Archipelago had been selected for exploration and development of such deposits (OCS Sale 46). If economic gas recovery is possible, petroleum development off Kodiak would include a liquified natural gas plant ashore and extensive gas plant transport lines from offshore wells. The Archipelago and adjacent shelf waters have high biological activity, endangered species, with the coastline highly vulnerable to oil spill damage. Probable ecological impacts were noted for such plant development. OCSEAP studies in Kodiak resulted in an extensive data base on marine environment biology, chemistry, geology, microbiology, physics, and in interdisciplinary workshops. Four major environmental issues were identified for the studies program: impact on commerical fisheries; geological hazards; contaminant transport; protection of regional biota and important habitants. The lease sale date was planned for December 1980. (Zielinski-IPA)

IMPACTS OF URANIUM MINING AND MILLING UPON THE FISH AND WILDLIFE RESOURCES OF THE NEW MEXICO SAN JUAN BASIN REGION,
New Mexico State Univer., Las Cruces. Dept. of Fishery and Wildlife Sciences.
S. C. Meneely, S. L. Duzan, and S. D. Schemnitz.
Available from Supt. of Documents, GPO, Washington, DC 20402. Fish and Wildlife Service, Biological Services Program, Report FWS/OBS-80/56, September 1980. 171 p, 7 Fig, 20 Tab, 235 Ref, 6 Append. 14-16-0002-77-906.

Descriptors: *Mine wastes, *Radioactive wastes, *Uranium radioisotopes, *Wildlife, *Fish, Mills, Mine water, Vegetation, Indian reservations, New Mexico, Arizona, Colorado, Widllife habitats, Water pollution.

Fish and wildlife species and their habitats within the San Juan Basin of New Mexico, Arizona and Colorado on Indian lands are identified. Field inventories were taken on existing and proposed uranium development sites during the summer of 1979 to determine the distribution of wildlife species. The inventories indicate species migration and emigration associated with this type of mining activity. Potential impacts that may be realized if different stages of uranium mining and milling are conducted were identified, based on development projections from the Bureau of Indian Affairs. Some species benefited as a result of water impoundments, in the water discharge and fencing to restrict grazing activity from the site. Direct impacts of uranium mining and milling include habitat alteration, contamination of aquifers and contamination by radionnuclides and toxic elements from uranium mill ponds and trailing piles. (Moore-SRC)

RESPONSES OF SUBMERSED VASCULAR PLANT COMMUNITIES TO ENVIRONMENTAL CHANGE: SUMMARY,
East Carolina Univ., Greenville, NC. Dept. of Biology.
G. J. Davis, and M. M. Brinson.
Available from Supt. of Documents, GPO, Washington, DC 20402. Fish and Wildlife Service, Biological Services Program, Report FWS/OBS-80/42, August 1980. 19 p, 1 Tab, 7 Ref. 14-16-0009-78-032.

Descriptors: *Aquatic plants, *Turbidity, *Sedimentation, *Plant growth, Aquatic environment, Water levels, Waves(Water), Seasonal, Nutrients, Submerged plants, Rooted aquatic plants, Eutrophication, Light intensity.

Since many land and water development projects have the potential of altering the environment of aquatic vascular plants, it is essential to unsdertand how aquatic plant species respond to changing physical, chemical, and biological conditions. Factors that affect the growth of submersed, rooted, aquatic macrophytes are reviewed, including: light transmission, fluctuating water levels, wave action, sedimentation, nutrients, and seasonal effects. Groups of macrophyte species are listed according to resistance to ecosystem change, and examples of human activities which may adversely affect natural systems and the possible effects on submerged plant populations are given in a table. POTENTIAL IMPACTS OF LOW PH ON FISH AND FISH POPULATIONS,
National Power Plant Team, Ann Arbor, MI.
E. S. Fritz.
Available from Supt. of Documents, GPO, Washington, DC 20402, Report FWS/OBS-80/40.2, October 1980. 17 p, 3 Tab, 45 Ref.

Descriptors: *Fish physiology, *Toxicity, *Acidity, Environmental effects, Fish populations, Fish reproduction, Fish diseases, Predation, Acidic waters, Habitats, Fish genetics.

One of the most alarming impacts associated with increasing acidification of surface waters, and acid precipitation is the decline and extinction of fish populations and assemblages in lakes and streams. The effects of low pH on fish are reviewed. The toxic effects of low pH are found to differ among species, populations, and age-groups of the same species. Field studies show that the toxicity of low pH is compounded by other water characteristics. Low pH could increase susceptibility to disease,

impair osmoregulation and ionregulation, inhibit hormone production or activity, result in genetic damage, change predator-prey relationships, degrade habitat, and increase the availability of toxic substances. Low pH can result in reproductive failure on the population level, recruitment failure, and on the individual level, cessation of spawning. Slight declines in productivity as they relate to stressed populations, have the potential to result in unrecoverable drops in population density. (Moore - SRC)

CHLORINATED PARAFFINS AND THE ENVIRONMENT. 2. AQUATIC AND AVIAN TOXICOLOGY,
Imperial Chemical Industries Ltd., Runcorn (England). Mond Div.
J. R. Madeley, and R. D. N. Birtley.
Environmental Science and Technology, Vol 14, No 10, 1215-1221, October, 1980. 1 Fig, 7 Tab, 15 Ref.

Descriptors: *Toxicity, *Chlorinated paraffins, *Path of pollutants, *Water pollution sources, Diets, Rainbow trout, Water birds, Mussels, Bioassay, Fish behavior, Biochemical oxygen demand, Anaerobic digestion, Microorganisms, Biodegradation, Pollutants, Fish.

The results of laboratory studies on toxicity, bioaccumulation, and biodegradation of chlorinated paraffins (CP) in the aquatic environment are presented; some information on avian and mammalian toxicity is also given. Short-term toxicity tests (96 hr) demonstrate the very low acute toxicity of CP to rainbow trout and bluegills. During more prolonged exposure, neurotoxic symptoms appeared when lower molecular weight compounds were tested. The level of CP in the body tissues of mussels was always less than that adsorbed on food particles filtered from the water. This uptake was reversed on substitution of 'clean' diets, and the CP appeared to be expelled from the animal in its original form. Rainbow trout appeared to metabolize CP. Up to 80% of assimilated C14 from C14-labeled CP in tissues was not recognizable as CP after 13 days. Microorganisms previously acclimated to specific forms of CP showed a greater ability to degrade the compounds than organisms normally treating domestic sewage. Increasing chlorination percentage inhibited biodegradation. Short-chain compounds were most readily oxidized at chlorine levels below 60%. Complete breakdown of long-chain CP was observed over a period of 8 Wk. Anaerobic microorganisms did not degrade a specific CP in 30 days. Cereclor S52 was of low subacute toxicity when fed to ring-necked pheasants and mallard ducks. In two predictive in vitro tests, three grades of CP showed no mutagenic potential. EFFECTS OF NUTRIENTS ON ALGAL GROWTH IN WATERS OF THE CANBERRA REGION AND RELATED CONTROL MEASURES,
Department of Housing and Construction, Phillip (Australia).
D. A. Henley, D. C. Keiller, and A. L. Downing.
Water Pollution Control, Vol 79, No 2, p 195-212, 1980. 12 Fig, 6 Tab, 21 Ref.

Descriptors: *Sewage treatment, *Water quality, *Algal control, *Nutrients, Nitrogen, Phosphorus, Mathematical models, Algae, Rivers, Waste water treatment, Water pollution, Water pollution control, Water resources planning, Sewage effluents, Lakes, Treatment facilities.

The effects of phosphorus and nitrogen in sewage effluent on algal growth in the rivers and lakes surrounding the Lower Molonglo Water Quality Control Centre, near Canberra, Australia were studied in order to guide operation of the plant. A river water quality model was developed that related water quality in rivers to their flow, to inputs of pollution from land and from sewage, and to the influences of 'self-purification' in the rivers. The model predicted that the removal of nitrogen and phosphorus at the plant would almost certainly produce a massive improvement in the quality of lake waters. Removal of nitrogen alone would probably bring about a similar, less marked, result. In neither case would the chance of major algal blooms be completely eliminated. Removal of phosphorus alone would be expected to bring about a major improvement in quality provided that all Canberra's sewage were treated, and the maximum phosphorus removal possible at the plant were consistently achieved. Removing phosphorus alone for as much time as possible would be of major economic benefit. At the time of writing, the plant had not brought denitrification tanks into use, and with limited phosphorus removal, little, if any, improvement in algal growth could be seen. This is not inconsistent with the conclusion that phosphorus removal to the full extent of plant capabilities will be required to achieve significant improvement. A discussion follows this article. (McKeon-FRC)

AGRICULTURAL AREA IMPACTS WITHIN A NATURAL AREA: CADES COVE, A CASE HISTORY,
Great Smoky Mountains National Park, Gatlinburg, TN. Uplands Field Research Lab.
S. P. Bratton, R. C. Mathews, and P. S. White.
Environmental Management, Vol 4, No 5, p 433-448, September, 1980. 11 Fig, 4 Tab, 33 Ref.

Descriptors: *Water pollution, *Nutrients, *Agricultural runoff, *Coliforms, Hay, Water temperature, Turbidity, Phosphorus compounds, Nitrogen, Ammonia, Water quality, Aquatic bacteria, National Parks, Tennessee, Pollutant identification, Benthic fauna, Fish, Vegetation, Wildlife.

Agricultrual management in Cades Cove, an historic district in Great Smoky Mountains National Park, has affected natural resources both within the district and in the adjoining natural areas. A program of hay and cattle production begun in 1967 brought about a number of changes in the terrestrial flora and fauna and in the aquatic systems. Changes in the aquatic system included siltation and an increase in nutrient loading. Water temperatures in the stressed area were increased as were turbidity and nutrient (PO4 and NO3) loads. The number of taxa represented in the benthos community in the stressed area of Cades Cove was also lower than in other stations monitored above and below the Cove. Coliform counts in the Cove were frequently in the 100s (per 100 ml) and occasionally in the 1,000. The fecal steptococcus to fecal coliform ratios indicated that animals rather than human sources were responsible. The fecal coliform levels were often higher than the State of Tennessee standards for primary contact (swimming: desirable level $< \text{or} = 200$) and were sometimes higher than secondary contact standards (desirable level $< \text{or} = 1{,}000$). The actions taken to date, including fencing cattle out of stream beds and reduction of herd size, has already had a restorative effect on the Cove. The effect of the agricultural management of Cades Cove on wildlife populations and vegetations is also discussed. (McKeon-FRC)

ALUMINUM POLLUTION AND FISH TOXICITY,
Clyde River Purification Board, East Kilbride (Scotland).
J. B. Hunter, S. L. Ross, and J. Tannahill.
Water Pollution Control, Vol 79, No 3, p 413-420, 1980. 3 Fig, 9 Tab, 9 Ref.

Descriptors: *Water pollution sources, *Fishkill, *Aluminum, Bioassay, Brown trout, Effluents, Pollutant identification, Sewage sludge, Hydrogen ion concentration, Waste Disposal, Toxins, Industrial wastes, Water treatment, Photosynthesis, Laboratory tests.

The chemistry, toxicity, and pathology of aluminum (Al) was studied in relation to stream pollution from an anodizing plant. Al was implicated in the sporadic occurrence of fish kills (brown trout) during 1974 and 1975 in the stretch of the Black Cart Water between Howwood and Kilbarchan, Scotland. The acute toxicity of Al was found to depend on the pH of the river water. In laboratory tests using tap water at neutral pH, Al was not acutely toxic even at concentrations of 200 mg/liter. However, at a concentration of 50 mg Al/liter, there was a 40% mortality in 96 hr at pH 8.0 and a 100% mortality in 42 hr at pH 8.5 and 9.0. In addition to the Al from the anodizing plant, a water treatment plant puts an additonal load of Al of up to 1.3 mg/liter on the stream to give a total of up to 3.7 mg/liter of Al downstream from the factories discharge point. It appears that the fish kills were due to the Al concentration in association with an increase in river pH, but whether this increase was caused by the anodizing effluent or photosyntheses is not certain. It is suggested that the maximum concentration of aluminum in the stretch of the river be limited to 0.5 mg/liter. (McKeon-FRC)
W81-00619

EFFECTS OF URBAN RUNOFF AND TREATED MUNICIPAL WASTEWATER ON A MAN-MADE CHANNEL IN NORTHEASTERN ILLINOIS,
Metropolitan Sanitary District of Greater Chicago, Roselle, IL.
I. Polls, C. Lue-Hing, D. R. Zenz, and S. J. Sedita.
Water Research, Vol. 14, No 3, p 207-215, March, 1980. 7 Fig, 6 Tab, 17 Ref.

Descriptors: *Water quality, *Benthic fauna, *Channels, *Sewage effluents, *Storm runoff, Bottom sampling, Chicago River, Water pollution sources, Sewage treatment, Isopods, Oligochaetes, Aquatic animals, Water pollution, Sewers, Diptera, Water analysis, Urban runoff, Municipal wastes.

Monthly samples were collected to monitor the composition of benthic macroinvertebrates and water quality at five sites along the North Shore Channel in Illinois from January to November of 1973. Entering the channel 5.4 km above its junction with the North Branch of the Chicago River are secondary treated effluents of the Northside Sewage Treatment Plant. During storms, sewer overflows add to the channel above and below the treatment plant discharge. Results were compared to a biological survey conducted by the U.S. Public Health Service in 1961. The most important change occuring in the benthic faunal composition downstream from the plant outfall was the presence in 1973 samples of large numbers of isopods and midges, suggesting improved water quality. The 1973 results also indicated that water quality was markedly affected by both urban runoff and a point source effluent from the Northside Sewage Treatment Plant. Compared to upstream values, levels of ammonium nitrogen, nitrite-nitrate nitrogen, total phosphorus, dissolved solids and conductivity in downstream channel waters were increased ($p < 0.05$). The benthic macroinvertebrate composition above and below the treatment plant outfall was characteristic of that found in organically enriched rivers. Samples from the five locations consisted of 89% pollution-tolerant oligochaetes, 7.4% chironomids, 3.5% isopods, and 0.1% leeches. Populations of macroinvertebrates were found to be elevated at all sample points below the treatment plant outfall compared to upstream populations. Macroinvertebrate numbers collected over the 11-month period averaged 9,360/sq m above the outfall and 128,550/sq m for areas 5.3 km below the outfall. (Geiger-FRC)
W81-00626

GROWTH RESPONSES OF SELECTED FRESHWATER ALGAE TO TRACE ELEMENTS AND SCRUBBER ASH SLURRY GENERATED BY COAL-FIRED POWER PLANTS,
Ames Lab., IA.
R. W. Vocke, K. L. Sears, J. J. O'Toole, and R. B. Wildman.
Water Research, Vol 14, No 2, p 141-150, February, 1980. 8 Tab, 67 Ref.

Descriptors: *Aquatic algae, *Toxicity, *Coal mine wastes, *Trace elements, Fly ash, Arsenic compounds, Mercury, Cadmium, Slurries, Scenedesmus, Laboratory tests, Water pollution control, Bioindicators, Environmental effects, Path of pollutants, Heavy metals, Growth rates.

The toxicity of trace elements arsenic (As), cadmium (Cd), mercury (Hg), and Selenium (Se) from coal-fired power plants and scrubber ash slurry extract (SASE) to the freshwater algae Ankistrodesmus falcatus, Scenedesmus obliquus, Selenastrum capricornutum, and Microlcoleus vaginatus were investigated in growth response laboratory tests. Algae were exposed to solutions of Na2HAsO4.7H2O, CdSO4, HgSO4, and Na2SeO4, and SASE from a western U.S. coal-fired power plant complex in a modified version of the EPA Algal Assay Procedure Bottle Test. Levels of trace pollutants in mg/liter in the growth response experiments ranged from 0.01-100.0 for As, 0.001-0.30 for Cd, 0.001-1.0 for Hg, and 0.01-50.0 for Se. SASE was tested at levels of 0.01-100%. A chemical analysis of SASE was made, and regression equations of algal responses to selected trace elements or SASE treatment levels were calculated. Median effective concentration values for the algae tested ranged from 0.048-30.761 mg/liter for As, 0.005-0.019 mg/liter for Cd, 0.33-0.253 mg/liter for Hg, 0.033-8.511 mg/liter for Se, and 3.048-15.417% for SASE. As was significantly inhibitory to the growth of Ankistrodesmus and Scenedesmus at 0.1 and 0.01 mg/liter, respectively, while Selenastrum growth was inhibited significanlty at 25 mg/liter As. Significant growth inhibition occurred in Selenastrum at 0.05 mg/liter Cd, and in the other three species at 0.01 mg/liter Cd. The first significant inhibition of growth of Ankistrodesmus, Scenedesmus, Selenastrum, and Microcoleus occurred at 0.05, 0.1, 0.01, and 0.4 mg/liter Hg, respectively and at 0.01, 0.1, 0.3 and 10 mg/liter Se, respectively. Significant growth inhibition to the four species in the above order was observed with exposure to 1, 5, 10 and 5% concentrations of SASE, respectively. (Geiger-FRC)
W81-00629

THE EFFECTS OF HARDNESS, ALKALINITY AND PH OF TEST WATER ON THE TOXICITY OF COPPER TO RAINBOW TROUT (SALMO GAIRDNERI),
Alberta Univ., Edmonton. Dept. of Zoology.
T. G. Miller, and W. C. Mackay.
Water Research, Vol 14, No 2, p 129-133, February, 1980. 2 Fig, 2 Tab, 34 Ref.

Descriptors: *Hydrogen ion concentration, *Copper, *Alkalinity, *Hardness(Water), *Rainbow trout, *Toxicity, Laboratory tests, Calcium compounds, Heavy metals, Lethal limits, Acidity, Chemical analysis, Spectrophotometry, Water quality, Water analysis, Potable water.

The relative effects of water hardness, alkalinity, and pH on the toxicity of copper to fingerling rainbow trout were investigated in laboratory tests. Fish were kept in test chambers under three separate combinations of alkalinity and hardness in experiments that took 9 months to complete. Variations in alkalinity were accomplished by changing the levels of bicarbonates in the initial dilution of the deionized water. The incipient lethal concentration of copper which caused 50% mortality (ILC50) was determined initially and at the end of the 9-month period. No difference was found in the ILC50 values measured before and after the experiment. Copper was found to be less potent in dechlorinated tapwater than in artificial freshwater ($p < 0.05$). The interaction of copper and acid was found to be antagonistic at pH values of 4.7 or less. A synergistic effect between acid and copper was observed at a pH of 5.4 which caused an ILC50 at copper levels equivalent to 22 micrograms/liter (47% of the control value at pH 7.2). Calcium hardness of the test water was more important than alkalinity in reducing the toxicity of copper. At a hardness of 12 mg/liter, increasing the alkalinity from 10 to 50 mg/liter had no effect on ILC50. When an alkalinity of 10 mg/liter was combined with an increase in hardness from 12 to 100 milligrams/liter, the ILC50 value was increased threefold. However, an antagonistic effect on copper toxicity was noted at a water hardness of 100 mg/liter when the alkalinity was increased. (Geiger-FRC)

PRELIMINARY OBSERVATIONS ON THE BENTHIC MACROINVERTEBRATE COMMUNITIES OF ROSS BAY, A POLLUTED AREA OF LOUGH LEANE, SOUTH-WEST IRELAND,
University Coll., Dublin (Ireland). Dept. of Zoology.
E. J. Wise, and A. O'Sullivan.
Water Research, Vol 14, No 1, p 1-13, January, 1980. 4 Fig, 4 Tab, 41 Ref.

Descriptors: *Lakes, *Benthos, *Water pollution, *Nutrients, *Sewage effluents, Phosphorus, Nitrogen, Ammonia, Chlorophyll, Algae, Biomass, Invertebrates, Biochemical oxygen demand, Dissolved oxygen, Suspended solids, Eutrophication, Detergents, Ireland, Ross Bay.

An attempt was made to quantify the effects of sewage effluent on the density distribution of benthic macroinvertebrates in the stony littoral zone of Ross Bay, Lough Leane, Ireland. The Lough is undergoing accelerated cultural eutrophication mainly due to the discharge of untreated human sewage and domestic detergents. Dissolved oxygen levels were satisfactory over the whole of Ross Bay with the exception of the station closest to the sewage outfall (Station 1), where oxygen depletion was observed (< 30% saturation). BOD levels were consistently low (range 0.8-4.7) except at Station 1 where a value of 5.8 was received. Nitrogen and phosphorus compounds showed a significant negative correlation with distance from the sewage outfall ($p < 0.05$). Chlorophyll a levels reached a peak at Stations 3-5 (mildly polluted) as a result of interaction between nutrient availability and the toxic effects of sewage loading. A relatively low total biomass (12.5 g/m) was found at Station 1 (septic/degradation zone), while organic enrichment promoted a maximum value (4,750 g/m) at Station 2 (moderately polluted). Biomass values decreased through Station 7 (fairly clean). A Biotic Quality Index was devised to allow for the use of information revealed by the species composition of a community. This index is only directly applicable to the lake system for which it was devised, but it can be used for any future assessment of the area. (McKeon-FRC)

THE EVOLUTION OF THALLUS FORM AND SURVIVAL STRATEGIES IN BENTHIC MARINE MACROALGAE: FIELD AND LABORATORY TESTS OF A FUNCTIONAL FORM MODEL,
California Univ., Irvine. Dept. of Ecology and Evolutionary Biology.
M. M. Littler, and D. S. Littler.
The American Naturalist, Vol 116, No 1, p 25-44, July, 1980, 4 Fig, 3 Tab, (California Water Resources Center Project UCAL-WRC-W-491). OWRT-A-054-CAL(13).

Descriptors: *Marine algae, *Benthos, *Biological communities, *Ecology, Plant morphology, Algae, Evolution, Laboratory tests, Synthesis, On-site investigations.

Morphological attributes of algae have long been considered primarily from the standpoint of taxonomy and used to discover new species or to speculate on phylogenetic affinities. While these approaches are of value, a fresh outlook that synthesizes the adaptational significance of algal structure, ecology, and physiology is needed. The present research explores the general concept that morphology, ecological attributes, and productivity are interrelated and synthesizes the adaptive significance of thallus form relative to the productivity ecology and survival of benthis macroalgae. SOURCES OF VARIABILITY IN MACROALGAL PRIMARY PRODUCTIVITY: SAMPLING AND INTERPRETATIVE PROBLEMS,
California Univ., Irvine. Dept. of Ecology and Evolutionary Biology.
M. M. Littler, and K. E. Arnold.
Aquatic Botany, Vol 8, p 141-156, 1980. 4 Fig, 1 Tab, 42 Ref, (California Water Resources Center Project UCAL-WRC-W-491). OWRT-A-054-CAL(14).

Descriptors: *Marine algae, *Primary productivity, *Aquatic algae, Sampling, Data collections, Variability, Growth rates, Environmental effects, Respiration, Plant physiology, Reproduction.

Previous macroalgal production studies have been plagued by broad ranges of variability within experimental replicates that often exceed the seasonal or other parameters under investigation. As a first step toward understanding the factors responsible, eight rocky intertidal and subtidal macroalgae were examined for intrinsic sources of variation in photosynthetic performance and respiration relative to season, age, thallus part, reproductive state, external morphology, crowding, macrohabitat, microhabitat, desiccation, and physical injury. An understanding of variations such as those documented in this study is necessary for accurate analyses of macroalgal energetics and for the development of predictive insights into evolutionary strategies of carbon allocation. Therefore, much of the previous research on marine macroalgal productivity should be re-assessed in view of difficulties arising from environmental and intrinsic sources of metabolic variation. Water Research, Vol 14, No 7, p 723-727, July, 1980. 4 Fig, 1 Tab, 12 Ref.

Descriptors: *Water sampling, *Tannery wastes, *Aquatic animals, *Mayflies, Benthic fauna, Water pollution effects, Streams, Water quality, Growth rates, Aquatic insects.

Monthly collections were made of aquatic invertebrates from a stony stream bed above and below a partially treated tannery effluent. Analyses of water samples indicated only slight differences in water quality parameters between the two sampling sites. It was concluded from findings in the analyses that mild tannery pollution which is sufficient to alter the species composition of the benthic invertebrate community did not influence the life histories and growth characteristics of the mayflies Rhithrogena semicolorata and Ephemerella ignita. It is suggested that this is likely to be the finding in the recovery zone downstream from severe organic pollution. However, this suggestion has not yet been tested on a suitable river with a heavy organic load and a natural re-purification pattern. (Baker-FRC)

AN INVESTIGATION INTO THE LONG-TERM EFFECTS OF RHINE WATER ON RAINBOW TROUT,
Netherlands Waterworks, Rijswijk. Testing and Research Inst.
C. L. M. Poels, M. A. Van der Gaag, and J. F. J. Van de Kerkhoff.
Water Research, Vol 14, No 8, p 1029-1035, August, 1980. 9 Fig, 2 Tab, 30 Ref.

Descriptors: *Toxicity, *Water pollution, *Rainbow trout, Rivers, Industrial wastes, Domestic wastes, Agricultural wastes, Fish physiology, Chlorinated hydrocarbon pesticides, Growth rates, Groundwater, Water quality, Rhine river, *Netherlands.

The possible negative influences of Rhine river water on rainbow trout (Salmo gairdneri) were evaluated. Trout were maintained in basins containing Rhine water (from the Lek River, a branch of the Rhine delta in the Netherlands) or ground-

water of drinking water quality for 18 months. When compared to trout kept in groundwater, those kept in Rhine water showed an inhibition of growth ($p < 0.005$ for weight and $p < 0.0005$ for length after 18 months), enlarged liver ($p < 0.05$ after 1 month) and kidneys ($p < 0.005$ after 9 months), reduced hemoglobin levels ($p < 0.005$ after 18 months), increased blood glucose levels ($p < 0.005$ after 12 months), a significant accumulation of chlorinated hydrocarbons in adipose tissue, and histological changes in the spleen and liver. It was concluded that Rhine water was chronically toxic to rainbow trout. These data support other experiments suggesting that the disappearance of the salmonids from the Rhine is due to the heavy pollution of this river from domestic, industrial, and agricultural wastes. (Geiger-FRC)

AN ECOLOGICAL RISK INDEX FOR AQUATIC POLLUTION CONTROL. A SEDIMENTOLOGICAL APPROACH,
National Swedish Environment Protection Board, Uppsala (Sweden). Water Quality Lab.
L. Hakanson.
Water Research, Vol 14, No 8, p 975-1001, August, 1980. 5 Fig, 23 Tab, 51 Ref.

Descriptors: *Mathematical models, *Heavy metals, *Water pollution, *Sediments, *Environmental effects, Lakes, Chemical analysis, Mercury, Cadmium, Copper, Chromium, Zinc, Polychlorinated biphenyls, Lead, Arsenic.

The development of an ecological risk index to be used as a diagnostic tool for determining the degree of pollution in lakes and basins is presented. The approach taken focuses on lake sediments and parameters that may be determined in a rapid, inexpensive and standardized manner from a limited number of sediment samples. The risk index was based on the following four requirements: (1) the ratio between the mean content of superficial sediment samples and the natural background levels of a particular toxic substance. (2) Toxic substances selected for measurement were PCB, Hg, Cd, As, Cu, Pb, Cr, and Zn. A number requirement was developed by summing the contamination factor for all selected toxic substances present in the sediment. (3) A sedimentological toxic factor was developed for each substance based on the individual toxicity of the substances selected. (4) The fact that different lakes and basins have different sensitivity to different toxic substances led to the development of the 'sensitivity factor.' These four requirements were developed into the potential ecological risk index. Risk index analysis results for 15 Swedish lakes of varying size, pollution status, and trophic status were presented. EFFECTS OF STREAMBANK MATERIALS ADDITIONS UPON MICROBIAL ACTIVITIES OF TWO SUB-ARCTIC CANADIAN RIVERS,
Simon Fraser Univ., Burnaby (British Columbia). Dept. of Biological Sciences.
L. J. Albright, K. V. Masuda, and G. L. Ennis.
Water Research, Vol 14, No 9, p 1363-1366, September, 1980. 5 Tab, 7 Ref.

Descriptors: *Rivers, *Sediments, *Dissolved oxygen, *Respiration, *Subarctic, Ice breakup, Aquatic productivity, Primary productivity, Microorganisms, Algae, Canada.

The dissolved oxygen (DO) levels and respiration rates of the Ogilvie and Swift rivers were evaluated at various times of the year as influenced by streambank and sediment additions in the context of microbial and bacterial biomasses and activities. In both rivers, levels of DO dropped significantly from early fall (9-15 mg/liter) to late winter (3-11 mg/liter) and remained at relatively high concentrations during the ice-free seasons of late spring following ice breakup (8-12 mg/liter) and summer (10-12 mg/liter). In late winter the experimentally determined respiration rates for both rivers were in the range of 0.023-0.048 mg 02/liter/day. When the river waters were treated with several soil horizon materials the respiration rates were markedly influenced. Most treatments > 0.10 g of streambank material/liter of water significantly increased oxygen utilization by the native aquatic microorganisms. Algal and heterotrophic productivities were also significantly increased. It is suggested that these rivers would tend to be most sensitive to pipeline related construction activity that would result in streambank and sediment materials additions in winter and least sensitive in late spring, following ice breakup, and early summer. 5D. Waste Treatment Processes

UV-OZONE AND UV-OXYGEN PROCESSES FOR COLOR REMOVAL FROM TEXTILE DYEING AND FINISHING WASTEWATERS,
Rhode Island Univ., Kingston. Dept. of Civil and Environmental Engineering.
C. P. C. Poon, and B. M. Vittimberga.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-127417, Price codes: A02 in paper copy, A01 in microfiche. Completion Report, (1980), 22 p, 12 Fig, 7 Tab. OWRT A-071-RI(1), 14-34-0001-9042.

Descriptors: *Waste water treatment, *Textiles, *Dyes, *Color removal, *Photoactivation, Acetone, Chemical reactions, Biochemistry, Pigments, Acids, Dissolved oxygen, Industrial wastes.

Photochemical degradation of dye molecules was studied by exposing solutions with acid, direct and dispersed dyes to UV. Acetone as a high triplet energy sensitizer enchanced the color removal rate by more than 100 times. Dissolved oxygen was an energy quencher which could be removed by N2 bubbling. N2 bubbling also provided adequate mixing to bring the dye molecules in closer contact with the radiation source. The only adequate means of measuring color removal was to measure color units as described by the American Dye Manufacturer's Institute (ADMI) because the color and its predominant wavelength changed in the course of photodegradation. Studies of continuous flow models included a tray model as well as single, and multi-column models. A tray model was found less effective. Single and multiple-column models were equally effective for some acid dyes but the multiple-column model was more efficient for resistent dyes. The power consumption per unit volume of dye solution treated was calculated for all dyes.

FILTRATION SYSTEM FOR HOUSEHOLD SEWAGE,
Great Circle Associates, Walnut Creek, CA. (Assignee).
S. B. Mullerheim, and F. G. Williams, Jr.
U.S. Patent No 4,191,647, 17 p, 14 Fig, 7 Ref; Official Gazette of the United States Patent Office, Vol 992, No 1, p 247, March 4, 1980.

Descriptors: *Patents, *Wastewater treatment, *Water pollution treatment, Domestic wastes, Filtration, Oxidation, Equipment, Instrumentation, On-site disposal system, Composting, Liquid level sensors.

A method and apparatus for treating wastewater such as sewage are disclosed. Designed principally for complete on-site wastewater treatment and disposal, the system separates wastewater into liquid wastes and solid wastes by filtration, treats the liquid wastes with a mild oxydizing agent and disperses them into unsaturated ground. The solid wastes are periodically removed, along with used portions of the paper filter medium and delivered, in the case of sewage, to a composting area where the still-fresh solids can be aerobically composted. Preferred and particularly advantageous embodiments of a filtering system, a sewage delivery system, a vacumm generating system, and a liquid level sensor, each of which may be used with the invention, are disclosed. (Sinha - OEIS)
W81-00526

SELF WASHING BELT STRAINER,
Q. L. Hampton.
U.S. Patent No 4,191,653, 5 p, 7 Fig, 4 Ref; Official Gazette of the United States Patent Office, Vol 992, No 1, p 249-250, March 4, 1980.

Descriptors: *Patents, *Waste water treatment, Equipment, Sewage treatment, Screens, Filtration, Cleaning, Self-cleaning.

An endless driven belt strainer is adapted for use as a porous barrier in a channel containing a flowing liquid, such as a channel supplying raw sewage to a treatment plant. The belt strainer is composed of a number of endless porous wire or plastic screen strips arranged in side-by-side relation and which pass over a driving roller, guide rollers and a tension adjusting roller, all of which rotate in a frame having an upwardly inclined bottom portion which slopes away from the direction of flow of liquid to be cleaned. A top portion located above the liquid level is equipped with cleaning means for removing foreign matter from the belt strainer as it commences its return travel. Each porous strip is twisted 180 degrees during the initial part of its return travel above the flowing stream, so that during a subsequent downward travel of these screen portions the freshly cleansed liquid will pass through the downwardly traveling flight portion for removing any debris clinging to its outer surface. An additonal endlessly driven cleaning device operates in front of the upwardly traveling screening surface for removing particles which cannot pass through the screen and are too large or of a nature such that they will not be taken out of the channel by the screen alone. (Sinha - OEIS)
W81-00527

TWO ZONE PROCESS FOR BIOLOGICAL TREATMENT OF WASTE WATER,
Canadian Liquid Air Ltd., Montreal (Quebec). (Assignee).
G. Savard, R. G. H. Lee, and D. Hornsey.
U.S. Patent No 4,192,740, 21 p, 13 Fig, 8 Ref; Official Gazette of the United States Patent Office, Vol 992, No 2, p 625-626, March 11, 1980.

Descriptors: *Patents, *Waste water treatment, *Water pollution treatment, Biological treatment, Water purification, Biochemical oxygen demand, Oxygen, Microorganisms, Equipment, Monitoring.

A process is provided for treating waste water biological and clarifying the biologically treated water in a single vessel rather than in separate vessels. It is possible to treat water in this system containing much higher concentration of waste. In the process the supply of oxygen to the biological reaction zone is carefully monitored to meet the biological oxygen demand and avoid the occurrence of undissolved oxygen in the form of gas bubbles in the biological reaction zone or the clarification zone. Further improvements are provided in oxygen dissolving devices rendering them especially suitable for the two zone treatment. (Sinha - OEIS)
W81-00528

PROCESS AND APPARATUS FOR THE BIOLOGICAL TREATMENT OF WASTE WATER,
Degremont S.A., Rueil-Malmaison (France). (Assignee).
J. Bernard, J. Bebin, and J-P. Hazard.
U.S. Patent No 4,192,742, 8 p, 1 Fig, 4 Ref; Official Gazette of the United States Patent Office, Vol 992, No 2, p 626, March 11, 1980.

Descriptors: *Patents, *Waste water treatment, *Water pollution treatment, *Biological treatment, Filtration, Biochemical oxygen demand, Oxygenation, Equipment, Filters, Superoxygenation.

Waste water to be treated is introduced into an enclosed gas tight oxygenation chamber. An oxygen-containing gas is also introduced into the

chamber at a pressure higher than atomospheric pressure so that oxygen is dissolved in a quantity higher than the saturation concentration value of oxygen in the waste water at atmospheric pressure, thereby superoxygenating the waste water. The superoxygenated waste water maintained at higher pressure is then passed into an enclosed gas tight filtering chamber which is separate from the oxygenation chamber and which is also maintained at higher pressure. No other oxygen is introduced and the superoxygenated waste water is passed through a biological filter bed thereby biologically purifying the waste water which is then removed from the filtering chamber. (Sinha - OEIS)
W81-00529

RECLAMATION OF CEMENT SLURRY,
Fowlerex Pty. Ltd., Brookvale (Australia). (Assignee).
M. G. Hood.
U.S. Patent No 4,192,745, 8 p, 5 Fig, 5 Ref; Official Gazette of the United States Patent Office, Vol 992, No 2, p 628, March 11, 1980.

Descriptors: *Patents, *Waste water treatment, *Industrial waste, Water pollution treatment, Separation techniques, Suspended solids, Water reuse, Cements, Equipment, Cement slurry, Concentration.

The invention provides a machine which concentrates the slurry and stores the concentrated slurry as a suspension of more or less consistent density throughout so enabling the concentrated slurry to be remixed into fresh concrete and preventing the settling and build up of sludge which otherwise occurs in the pits. Thus the machine has the ability to accept slurry from settling pits or aggregate reclamation plant, to separate the cement from most of the water, to store the separated material and to allow relatively clean water to flow back into the pits. Both the concentrated slurry and the water may be reused in fresh concrete. (Sinha - OEIS)
W81-00530

LIQUID CLARIFICATION SYSTEM,
K. S. Arvanitakis.
U.S. Patent No 4,192,746, 13 p, 11 Fig, 3 Ref; Official Gazette of the United States Patent Office, Vol 992, No 2, p 628, March 11, 1980.

Descriptors: *Patents, *Waste water treatment, *Water pollution treatment, Industrial wastes, Separation techniques, Water purification, Chemical reactions, Chemical precipitation, Filtration, Equipment.

This invention relates to a liquid/solids separation system utilizing a settling clarifier to remove solid material suspended in a liquid through the introduction of chemicals and inert solids to accelerate the settling rate or precipitation of the solids from the liquid. The effluent discharge may be further processed, discharged, or recycled depending upon the nature of the effluent. The semi-solids material which is settled or precipitated is passed to a storage reservoir where this material is further processed in order to obtain predetermined uniform quantity of solids material in the sludge. This material is then discharged into a filtration system where the solids are utilized to form a filter cake on the septum of the system filters with the filtrate being discharged for further processing, disposal or reuse depending upon the nature of the liquid. (Sinha - OEIS)
W81-00531

SELECTIVE MULTIPLE ELECTRODE WASTE WATER TREATING SYSTEM,
A. S. King.
U.S. Patent No 4,193,859, 5 p, 2 Fig, 6 Ref; Official Gazette of the United States Patent Office, Vol 992, No 3, p 1000-1001, March 18, 1980.

Descriptors: *Patents, *Waste water treatment, Water pollution treatment, *Electrodes, *Flocculation, Selectivity, Integrated control measures, Equipment.

A number of individual treaters, each containing a pair of oppositely charged electrodes, are arranged circularly around a tank into which all of the treaters empty. A common supply manifold for all of the treaters brings waste water into the system for treatment by any selected one of the treaters upon opening a control valve associated with the treater and closing control valves associated with the remaining treaters. Each treater contains an electrode that is constructed from a material differing from that in the remaining treaters so that a particular treater may be selected for use based upon the predicted reaction of the material from which its electrode is made with the particular constituents of the waste liquid being treated. The central tank into which all treaters empty includes a pair of oppositely charged electrodes of its own to expose the once treated liquid to yet a second electric field, and there is a special structure associated with the lowermost discharge end of the electrode pair within the tank which is so arranged and configured that it reduces turbulence adjacent the floor of the tank to encourage settling out of floc produced by the treating process. (Sinha - OEIS)
W81-00532

FERRITE FLOCCULATING SYSTEM,
General Electric Co., Schenectady, NY. (Assignee).
G. M. J. Slusarczuk, and R. E. Brooks.
U.S. Patent No 4,193,866, 5 p, 1 Fig, 1 Tab, 4 Ref; Official Gazette of the United States Patent Office, Vol 992, No 3, p 1003, March 18, 1980.

Descriptors: *Patents, *Waste water treatment, *Water pollution treatment, Suspended solids, *Flocculation, Separation techniques, Organic compounds, Magnetic ferrite.

The invention relates to the purification of aqueous polluted liquid containing suspended particulate impurities by adding a magnetic ferrite powder which is suspendible in the liquid and then adding an aqueous flocculating solution comprised of an aqueous solution of polyethyleneimine for co-flocculating the particulate suspended impurities and the magnetic powder and producing a dense flocculated mixture which settles rapidly in a matter of minutes. (Sinha - OEIS)
W81-00533

WASTEWATER AND WASTEWATER SOLID PROCESSING SYSTEM,
M. Brucker, R. J. Matika, and M. E. McMican.
U.S. Patent No 4,193,869, 16 p, 11 Fig, 24 Ref; Official Gazette of the United States Patent Office, Vol 992, No 3, p 1003-1004, March 18, 1980.

Descriptors: *Patents, *Waste water treatment, *Water pollution treatment, Domestic wastes, Separation techniques, Sludge treatment, Filtration, Coagulation, Evaporation, Water reuse.

The invention is a system for processing wastewater and wastewater solids. It accepts wastewaters such as domestic or industrial sewage, food-processing wastewaters and associated solid matter, and other wastewaters of like nature. It removes a substantial fraction of the solid matter contained in suspension, dewaters the solid matter, transports the pressed solid matter to a storage facility for further processing or optionally for immediate disposal, optionally further processes the solid matter to produce a soil supplement or subjects solids to microwave treatment which renders the material sterile. The system clarifies the influent wastewaters by a water separator and air flotation units, both with and without the use of chemical coagulants as the case may be, and discharges the clarified wastewaters at this stage of treatment, or alternatively transports the clarified wastwaters to a filter unit or a filter bed unit which completes the treatment process by evaporating or transpiring pure water to the atomosphere while absorbing all contaimants in the filter bed media. The physical-chemical system processes the wastes in 60 minutes or less thus preventing the waste from ever going septic and eliminating the need for large tanks. (Sinha-OEIS)
W81-00534

APPARATUS FOR CLARIFYING LIQUID,
Envirotech Corp., Menlo Park, CA. (Assignee).
M. J. Lillywhite.
U.S. Patent No 4,193,877, 9 p, 7 Fig, 6 Ref; Official Gazette of the United States Patent Office, Vol 992, No 3, p 1006, March 18, 1980.

Descriptors: *Patents, *Waste water treatment, *Water pollution treatment, Sewage treatment, Activated sludge, Separation techniques, Skimming, Equipment.

An apparatus for clarifying liquid waste has a tank with a center column mounted in its center and suction pipes to remove sludge which has settled to the floor of the tank. The center column is provided with an influent trough to introduce liquid waste into the tank, and ports are formed in the upper part of the column to introduce waste into the influent trough. The ports and the influent trough are located at about the level of the liquid in the tank so that the waste leaving the ports creates a radially outward current on the surface of the liquid in the tank to carry scum towards the periphery of the tank for collection. TREATMENT OF INDUSTRIAL LIQUID WASTES BY ELECTROFLOTATION,
Salonika (Greece).
K. A. Matis.
Water Pollution Control, Vol 79, No 1, p 136-142, 1980. 5 Fig, 11 Ref.

Descriptors: *Flotation, *Waste water treatment, *Sludge treatment, *Design data, *Electrical design, Coagulation, Electrolytes, Biological treatment, Separation techniques, Gases, Anodes, Cathodes, Membranes, Industrial wastes, Laboratory tests, Hydrogen ion concentration, Sea water, Suspended solids, Biochemical oxygen demand.

Batch tests and continuous flow experiments were conducted in a laboratory using an emulsified oil dispersion and an alum dilution to obtain data to evaluate the design and effectiveness of a continuous flow electroflotation sludge thickening unit. Electroflotation is used to reduce BOD and suspended solids in industrial effluents. Results showed a retention period of 55 min in continuous operation and 30-min retention period in batch tests. The continuous flow experiments showed the reduction in concentration to be about 90% at a current density of 300 A/sq m. The feed concentration ranged from 1,000-1,500 mg/liter, and the effluent contained 100-150 mg/liter. As with air flotation and sedimentation, the performance of the electroflotation unit depends upon inlet design which is critical to the reduction of turbulence and maintenance of intact bubbles. With horizontal electrodes separated by a membrane, it was observed that one gas activates the process while the other contributes to the transfer of coagulated matter. A saving of electricity was observed. pH was determined to be significant when seawater is the electrolyte. The retention period and the effluent concentration are strongly dependent on pH, and flotation rates are high within a narrow pH range. Further research could improve bipolar cell design and maximize generation of gas. (Titus-FRC)

EXPERIENCES OF HIGH-RATE BIOLOGICAL FILTRATION AT DERBY SEWAGE-TREATMENT WORKS,
Severn-Trent Water Authority Birmingham (England). Derwent Div.
P. B. Smith, and D. Yates.
Water Pollution Control, Vol 79, No 1, p 87-98, 1980. 1 Fig, 5 Tab, 3 Ref.

Descriptors: *Waste water treatment, *Odor, *Filtration, Sludge, Pre-treatment, Trickling filter, Or-

ganic loading, Protozoa, Anaerobic conditions, Nitrates, Treatment facilities, Biochemcial oxygen demand, Biological treatment.

A high-rate biological filtration unit was built at Derby, England using Flocor E plastic media in an attempt to remedy the overloaded existing system. Constructed between July, 1973 and September 1975, the plant consists of 6 filter units, 24m in diameter and 3m deep, each containing 1,132 cu m of medium. One of the filters was divided into quadrants and was used for an experimental comparison of Flocor E media against three other competitive media. The work at Derby has demonstrated that high-rate biological filtration is an economically viable process, and when at an intermediate stage, is capable of significant reductions in the applied organic loading. All four media achieved 40% BOD removal by July, 1976. It produced an effluent suitable for further treatment by normal low rate biological filtration, giving a corresponding improvement in effluent quality. Problems arose with regard to sludge production, which was higher than expected and produced significant effects on other treatment units. The unit was forced to cease operation in December, 1976 when the surrounding community complained of a severe odor, the exact cause of which has not yet been ascertained. The compound could be a biological-degradation product, could be present in the original feed liquor, or could be a consequence of synergistic interactions with other chemicals discharged in the vicinity. A discussion of this paper is also presented. (McKeon-FRC

A STUDY OF THE PROTOZOAN AND METAZOAN POPULATIONS OF THREE OXIDATION DITCHES,
University of Wales Inst. of Science and Technology, Cardiff. Dept. of Applied Biology.
J. E. P. Poole, and J. C. Fry.
Water Pollution Control, Vol 79, No 1, p 19-27, 1980. 10 Tab, 15 Ref.

Descriptors: *Protozoa, *Metazoa, *Oxidation lagoons, Biomass, Suspended solids, Biochemical oxygen demand, Activated sludge, Rotifers, Nematodes, Sewage treatment, Water quality, Sewage effluents.

The protozoan and metazoan populations inhabiting three oxidation ditches over a 1-mo period compared with those reported to occur in activated-sludge plants. The relationship between protozoan species in the mixed liquor and the BOD of the final effluent is also examined. Oxidation ditches appeared to support populations of peritrichs, crawling ciliates, bdelloid rotifers, nematodes, and aeolosomatid oliogochaetes. If high concentrations of mixed-liquor suspended solids were maintained, the biomass of nematodes and aeolosomatids far exceeded that of protozoa. Large populations of protozoan species were found that rarely occur in conventional activated-sludge plants, and relatively larger populations of metazoa were also found in the oxidation ditches. The abundance of protozoan species was found to fluctuate over as little as 11-14 days, nevertheless the monthly average BOD in the final effluent could be predicted from the protozoan species present in the mixed liquor. In a discussion following the article, it is noted that the presence of a more varied metazoan population in the oxidation ditches was primarily due to the longer retention periods than those in activated-sludge plants. It is also explained that there were few differences between the sludges except for a higher concentration of suspended solids in one of the ditches. (McKeon-FRC)

SEWAGE DISPOSAL IN DEVELOPING COUNTRIES: SOME THROUGHTS,
Allott and Lomax, Manchester (England).
R. Foster.
Water Pollution Control, Vol 79, No 1, p 28-41, 1980. 13 Fig.

Descriptors: *Sanitary engineering, *Sewage treatment, *Domestic wastes, *Environmental sanitation, Septic tanks, Sewers, Regional economics, Sewerage, Biological treatment, Governments, Municipal wastes, Water requirements, Economic feasibility, Africa, History.

The history of the sewerage system in the United Kingdom is reviewed and contemporary sanitation projects in selected developing countries are described. In the Middle Ages sanitation ranged from the midden heap and the privy to the Rochedale system in which disinfected pails in outhouses were transferred to processing plants by vans. Water closets developed in the late eighteenth century improved domestic health by removing waste from houses, yet caused pollution of rivers used as sewers. Sewage treatment began in the late nineteenth century. The present state of technology with computer controlled plants and biological treatment is an outgrowth of the water-carriage system which has historical roots. In developing countries sanitation problems include limited water, funding, and architechture as well as tropical climates and scarce transportation. Appropriate facilities include variations on the pit latrine such as the vault latrine with watertight composting, the aqua privy with a water-filled pit, and the septic tank which accepts all domestic waste and connects to internal plumbing. Cities in Saudi Arabia and Ghana have recently constructed water-carriage systems to accommodate the needs of large, high density populations and make use of available water. Similar sanitation options are under study in Nigeria, where cost constraints, the necessity of property demolition and education programs are complicating factors. (Titus-FRC)

RECOVERY OF PROTEIN AND FAT FROM FOOD INDUSTRY WASTE WATERS,
Alwatech Ltd., High Wycombe (England).
A. P. Hopwood.
Water Pollution Control, Vol 79, No 2, p 225-235, 1980. 4 Fig, 11 Tab, 13 Ref.

Descriptors: *Sludge disposal, *Environmental sanitation, *Food processing industry, *Waste water treatment, *Industrial wastes, Soil contamination effects, Recycling, Pollutants, Treatment facilities, Chemical precipitation, Biochemical oxygen demand, Suspended solids, Coagulation, Proteins, Dewatering, Drying, Animal diseases, Microorganisms, Lipids, Flocculation, Economics.

With the increasing demand for the slaughter of animals for human consumption, new methods must be found to control the pollution connected with waste water from abattoirs and meat and poultry packing plants. Animal proteins may be recovered from waste water by precipitation with purified lignosulphonates (LS). LS are a byproduct of sulphite cellulose production and occur in sulphite lye. A complete primary waste-water treatment system for food industry effluents has been developed using the LS method. Several LS plants have been in full-scale operation for about seven years. Average percent removals of BOD, suspended solids, and free oil and grease over a 10-day period from the waste water of a beef abattoir using the LS treatment was 79, 87, and 95%, respectively. LS precipitated proteins have been used as animal food additives with no adverse effects when the LS concentration in the total diet is below 3%. The heat coagulation, dewatering and heat drying steps of the LS process are effective in removing viable microorganisms thus reducing the risks of animal disease transfers. Water recycling in LS processing seems feasible, however the fact that it is not natural water has prevented the EPA from allowing its use for human consumption. The major advantage of protein and fat recovery by LS treatment is the elimination of offsite sludge disposal. The economics of the process in the United Kingdom and the effectiveness of various flocculants are also mentioned in a discussion following the article. (Geiger-FRC)

OILY EFFLUENT TREATMENT BY THE BP TREATMENT PROCESS,
British Petroleum Co. Ltd., London (England).
G. F. Oldham.
Water Pollution Control, Vol 79, No 2, p 236-243, 1980. 1 Tab.

Descriptors: *Oil wastes, *Biological treatment, *Filtration, *Waste water treatment, *Water pollution treatment, Sludge disposal, Polyelectrolytes, Incineration, Dewatering, Flocculation, Pilot plants, Operating costs, Activated sludge, Phenols, Sulfides, Installation costs, Industrial wastes, Costs, Flotation.

Conventional treatment of oily effluents from refineries or petrochemical factories consisted of flocculation and/or flotation with adsorption onto flocs such as ferric hydroxide and treatment of activated sludge by thickening, dewatering and incineration. In the early 1970s, the British Petroleum (BP) Sweden refinery was required to meet a treated effluent quality of 5 mg/liter oil, 21 mg/liter BOD, and 1 mg/liter standards for phenols and sulfides. Since the existing biological treatment had several flaws, chemical flocculation with ferric salts was examined as an alternate treatment. This method brought problems of sludge removal, so biological filtration and activated sludge treatment were considered. Biological filtration was found to have important advantages over activated sludge with regard to high inlet temperatures, pH variations, sudden density changes, and turn-down ratios. Biological filtration can be fully automated thus reducing operating costs. The filters for biological treatment were also cheaper than activated sludge. Results at pilot plants and full scale operations using granular filtration treatment of oily effulents were good. Oily emulsions can be treated by polyelectrolytes to produce waters suitable for biological filtration. Installation costs of the BP process plants were about 40% of those of conventional treatment sites, including incinerators. Operational costs of the BP facilities were approximately 5% of those of conventional processes. Effluents that have been treated by the BP technique include those from simple refineries to complex refineries with oil terminals and ballast water. Successful pilot tests have also been run on petrochemical effluents and North Sea oil ballast water at low temperatures and high salt content. An Extensive discussion follows the article. The uprating of the Philadelphia sewage treatment plants by the adoption of the Surfact process is described. Surfact physically merges a rotating biological contactor (RBC) with a diffused air aeration tank which results in the ablity to handle large biomass at low energy costs with little maintenance. Discs could be placed into existing aeration tanks as soon as supports were constructed. Preliminary pilot-scale studies were conducted in 1974 to determine whether the RBC units would rotate when placed in aeration tanks. Favorable results were achieved. A full-scale RBC caused the media to rotate with the surface hyraulic motion which allowed minimal energy requirements. When a prototype system was examined through six modes, similarities were found between the Surfact and the conventional activated-sludge system. During the 11 months of Surfact operation, surface biology studies, soluble BOD profiles, settling tests, disc rotation experiments, and power consumption evaluations were conducted. Discs supported a growth equivalent to 1,500 mg/liter mixed liquor suspended solids. Microbial populations of disc solids and suspended cultures were nearly the same and resembled those found in activated sludge. Sludge settlement demonstrated initial velocities of 5.8 m/hr. The present proto-

type had some oxygen limitations that are currently being corrected. Step feeding processes will be implemented to reduce solids overloading of the final clarifier and disperse the organic load to all discs. Upgrading to Surfact may be accomplished rapidly, and its low costs of operation make it an attractive choice for the construction of new secondary facilities. A discussion follows the article. EXPERIENCE IN OPERATING THE DEEP-SHAFT ACTIVATED SLUDGE PROCESS,
Anglian Water Authority, Huntingdon (England). Essex Sewage Div.
O. C. Collins, and M. D. Elder.
Water Pollution Control, Vol 79, No 2, p 272-285, 1980. 3 Fig, 2 Tab, 6 Ref, 1 Append.

Descriptors: *Denitrification, *Sewage treatment, *Activated sludge, Foaming, Surfactants, Sludge disposal, Settling velocity, Biological treatment, Organic wastes, Biochemical oxygen demand, Treatment facilities.

A deep shaft to treat sewage at the Marsh Farm, Tilbury Treatment Works, England was constructed to meet BOD standards of 60 mg/liter and to handle maximum daily loads of 7,050 kg BOD. The shaft was 130 m deep and 1.86 m in diameter and was designed for a sewage retention period of 1.5 hr at a maximum feed rate of 277 cu m/hr. The shaft was capable of removing high organic loads while producing an effluent which was acceptable for discharge to the estuarial River Thames. Problems with degassing and settlement still need to be overcome, but no foul odors or fly populations accompanied the process. The operation of the shaft requires considerable attention, but automation may solve this situation. Screening and degritting are necessary for effective treatment of crude sewage. The compact layout of the shaft allows easy access to operation areas. Sludge production has been much greater than was originally predicted, and difficulties exist in solids separation. In discussions following the article, mention is made of the problems of foaming to which the deep-shaft process lends itself. If surfactants are present in the sewage material, foaming becomes a great nuisance causing unsightly working conditions. To date the operation of the deep-shaft facility is very complex, and design standard effluents have not been consistently achieved. (Geiger-FRC)

FLUIDIZED- AND EXPANDED-BED REACTORS FOR WASTE-WATER TREATMENT,
Water Research Centre, Stevenage (England).
P. F. Cooper, and D. H. V. Wheeldon.
Water Pollution Control, Vol 79, No 2, p 286-306, 1980. 7 Fig, 7 Tab, 68 Ref.

Descriptors: *Denitrification, *Biological treatment, *Sewage treatment, *Waste water treatment, Reviews, Landfills, Water treatment, Potable water, Sewage sludge, Suspended solids, Industrial wastes, Particle size, Fluidized beds, Expanded beds, Carbon, Sewage effluents.

The state of the art of fluidized- and expanded-bed technology is reviewed with a brief account of work at the Water Research Centre's (WRC) Stevenage Laboratory in England in denitrification of sewage effluents using expanded beds. This method of removing the non-settleable organic content of sewage reduces considerably the size of treated biomass. At the WRC facility, methanol is used as the main carbon source in the reactor. Denitrification became linear with respect to time in the 1.0- to 3.0-m height zone, and the volumetric rate of removal in this part of the bed was 4.6 kg Oxd-N/cu m/day. Calculations of the sludge production rate showed that at a sludge age of 14 days, production was 0.17 g biomass volatile solids concentration/g methanol. It was possible to use settled sewage as the carbon source for denitrification in an anoxic fluidized bed with a conical distribution system. However, it was considered doubtful that an expanded-bed or fluidized system would operate successfully using settled sewage as the carbon source. The fluidized-bed system could be designed in modular fashion to replace easily an existing overloaded plant by a more powerful system. Sludge disposal from bed systems could be directed to landfills. The need for a clarification stage to handle suspended solids is still debatable. Fluidized beds will most likely be used for denitrification of river or bore-hole waters prior to potable water treatment, to update existing sewage treatment facilities, and to treat concentrated industrial wastes. A discussion follows the article. (Geiger-FRC)

THE CLARIFICATION OF EFFLUENT FROM AN ACTIVATED-SLUDGE PLANT USING DISSOLVED-AIR FLOTATION,
Universidade Federal do Rio de Janeiro (Brazil). Inst. de Quimica.
J. E. L. Maddock, and E. J. Tomlinson.
Water Pollution Control, Vol 79, No 1, p 117-125, 1980. 7 Fig, 4 Tab, 4 Ref.

Descriptors: *Flotation, *Activated sludge, *Sewage treatment, *Aerobic tratment, *Coagulation, Settling basins, Separation techniques, Water pollution treatment, Sludge, Turbidity, Effluents, Pilot plants.

A pilot-scale dissolved-air flotation (DAF) unit was designed and operated at the existing Peterborough sewage treatment works in England. The pilot unit was used to demonstrate that DAF after the secondary sedimentation basin could reduce suspended solids in the plant effluent to < 30 mg/liter of suspended solids (SS). The maximum hydraulic load which could be applied to the DAF unit while clarifying a dilute suspension of solids was approximately 12 cu m/sq m hr. This had to be reduced proportionately when the SS concentration was > 800/liter. The minimum sludge recycling rate required to promote satisfactory clarification of a dilute suspension by flotation was 7%. Increased rates were required when the SS concentration in the DAF feed exceeded about 400 mg/liter. Solids separated by floation were not removed effectively by scrapers even after modifications were made. The addition of coagulants and polymers did not reduce the SS in the effluent over that without any chemical addition (this was usually < 15 mg/liter). (McKeon-FRC)

DETOXIFICATION OF KRAFT PULPMILL EFFLUENTS BY FOAM SEPARATION.
Water and Pollution Control, Vol 118, No 9, p 18-20, September, 1980.

Descriptors: *Foam fractionation, *Bleaching wastes, *Waste water treatment, *Pulp and paper industry, Biodegradation, Surfactants, Pilot plants, aeration, Wood wastes, Economic feasibility, Sulfides, Organic compounds, Laboratory tests, Industrial wastes.

Foam fractionation is an alternative to biological processing of pulp and paper industry effluent which achieves detoxification at less expense. Sulfides, mercaptans, unsaturated fatty acids, resin acids, chlorinated organics and other wood extractives are among the substances in bleached effluents that are toxic to fish and other life. The foam fractionation process exploits the phenomenon that toxic surfactants are collected in the foam phase which is readily formed in aeration of bleached pulpmill effluent. The foam is collected and treated separately. Laboratory and pilot plant studies conducted during a 7-yr period in Vancouver, British Columbia determined that the surface area of foam generated must be proportional to the toxicity of the effluent and averages 30 sq m of area per liter effluent. The configuration of aerators within the foam stage is also critical. Detoxification is optimized with a three-stage system and a 20-min retention period in each stage. Conventional biological treatment of the extracted foam readily achieved detoxification. Eighty-three percent of 205 whole mill effluents were detoxified in less than 5 hr under laboratory conditions. Experiments suggest that this method has application throughout the bleach kraft industry and in particular in situations where land is expensive and reductions in treatment time are advantageous. (Titus-FRC)

USE OF THE DEEP-SHAFT-PROCESS IN UPGRADING AND EXTENDING EXISTING SEWAGE-TREATMENT WORKS,
Thames Water Authority, London (England). Vales Div.
G. C. Cox, V. H. Lewin, J. T. West, W. J. Brignal, and D. L. Redhead.
Water Pollution Control, Vol 79, No 1, p 70-86, 1980. 6 Fig, 5 Tab, 22 Ref.

Descriptors: *Pilot plants, *Municipal wastes, *Hydrostatic pressure, *Sludge digestion, *Sewage treatment, *Filtration, Depth, Nitrification, Construction costs, Toxins, Heavy metals, Waste dilution, Underground, Oxygenation, Biological treatment.

The deep shaft process of sewage treatment was tested in a pilot plant and evaluated for effectiveness in municipal sewage treatment. Findings indicate that this process is suited to areas with restricted land and to sewage with high carbon content. In the pilot plant the shaft extended to a depth of 61 m. Degritted sewage enters a settlement tank where anaerobic digestion, precipitation of heavy metals, and dilution take place. In the shaft, hydrostatic pressure is used to effect high oxygen transfer efficiencies. Carbon dioxide and nitrogen gas are released as bubbles. The effluent then undergoes degasification either through vacuum methods or bubble stripping followed by settlement and subsequent filtering for nitrification. Experiments revealed that both oxygen transfer efficiency and construction costs increase with the depth of the shaft. Effluent samples produced ranged from 72 to 96% nitrified depending on the degree of loading of the filters. On two occasions during the three month test period toxic discharges with abnormal pH occurred. This method is limited in its ability to dilute toxins because the volume of the shaft is lower than that of conventional sludge treatment systems. Development of a biological monitoring system for control of effluent is proposed. (Titus-FRC)

PRIMARY FLOCCULATION OF CADMIUM PLATING PLANT EFFLUENT: IMPROVED OCCUPATIONAL HYGIENE AND EFFLUENT QUALITY,
Hainsworth Research Centre, Hull (England).
A. Ashton.
Water Pollution Control, Vol. 79, No 3, p 421-424, 1980. 5 Fig, 2 Ref.

Descriptors: *Cadmium, *Industrial wastes, *Flocculation, Sulfates, Metals, Chemical precipitation, Chlorine, Hydrogen ion concentration, Water quality, Effluents, Water pollution sources, Laboratory tests, Toxicity.

Ferrous sulfate and aluminium sulfate were tested for use as primary flocculants of cadmium plating plant effluent in an effort to improve the quality of effluent and the poor occupational hygiene associated with a static drag-out. After destruction of the cyanide in a diluted sample of the plating effluent at a pH of 11.0 to 11.5 by the addition of a slight excess of hypochlorite, the flocculent under study was added until the pH was lowered to the desired level (9.5). Of the two flocculants, ferrous sulfate was somewhat superior with respect to rate of settlement, effective pH range, and effective concentration range. In addition, when ferrous sulfate was added, the pH was reduced as metal hydroxide was precipitated, and there was reduction in the level of available chlorine, both immediately and after standing for 1-2 hr. By using ferrous-sulfate flocculation in the treatment of dilute cadmium plating effluent, it should be possible to operate an electroplating plant with a flowing drag-out tank. In this way, occupational hygiene can be improved by avoiding batch treatment of heavily-contaminated effluents from static drag-outs. Effluent quality would also be improved with respect to cadmium, pH, and available chlorine levels. (McKeon-FRC)

ACTIVATED SLUDGE SETTLEMENT - SOME SUPPOSITIONS AND SUGGESTIONS,
Birmingham Univ., (England). Dept. of Civil Engineering.
C. F. Forster, and J. Dallas-Newton.
Water Pollution Control, Vol 79, No 3, p 338-351, 1980. 11 Fig, 5 Tab, 17 Ref.

Descriptors: *Sewage treatment, *Activated sludge, *Sewage sludge, Suspended solids, Design, Aerobic treatment, Microbiology, Waste water treatment, Flocculation, Coagulation, Settling basins.

The causes of poor settling characteristics of activated sludge are discussed along with laboratory measurements which can be used to predict the settleability of sludge. Settling rates are determined by the microbiology and the surface biochemistry of the sludge. In sludge dominated by filamentous species, the individual flocs are held apart in a huge three-dimensional matrix hindering both the downwards motion of the solids and the upward flow of liquid. In some sludges, a large repulsion factor due to surface biochemistry can hold the particles far enough apart to result in poor settling. A relationship was shown between the sludge volume index (SVI) laboratory measurement and chemical parameters which could affect the nature of the sludge surface. The SVI should be used as the prime operational index that can be used in conjunction with chemical parameters to predict bulking. The SVI should remain as an excellent design parameter, from which sludge recycle rates and sedimentation tank loading rates can be calculated. A discussion follows the presentation of the paper. DEVELOPMENT OF THE BRISTOL REGIONAL SEWAGE-TREATMENT WORKS AND ASSOCIATED SEWERAGE SCHEME,
Wessex Water Authority, Bristol (England).
P. H. Steel.
Water Pollution Control, Vol 79, No 3, p 333-337, 1980. 3 Fig, 2 Tab, 5 Ref.

Descriptors: *Sewage treatment, *Sewage districts, *Sludge disposal, *Planning, Interceptor sewers, Cost allocation, Domestic wastes, Pumping plants, Hydraulic equipment, Sewers, Sludge digestion, Reservoir construction, Sewerage, Economics, Construction, Ultimate disposal.

The development of the Bristol, England regional sewerage and sewage-treatment scheme is described, future programs are identified, and priorities are suggested. Construction was begun in 1959 and was planned to be carried out in stages over a 20- to 30-year period to maintain an appropriate rate of expenditure given the expected increase in the contributing population. The plant is presently 65% complete. Extensions of the plant began in 1970 and included an activated sludge plant, a sludge digestion plant, an industrial-water reservoir, pumping station, and generating station. As a result of growth and increase in flow, both the hydraulic capacity and sedimentation capacity of the plant have declined, producing consequent declines in sludge and effluent recovery. Since 1968, over 900 tonnes/day of liquid digested sludge have been dumped in the deep water of Bristol Channel by ship. Future programs are designed to accomplish the initial objectives of removing all crude discharges and connecting outmoded sewers to the works. By 1995, certain interceptors shall be extended and constructed. It is suggested that adequate sludge treatment capacity be achieved by 1982 and that hydraulic deficiencies be remedied by 1984. This scheme is the most economical sewage-treatment works in the region and reflects both the benefit of size and lower standard of effluent required. In a discussion following the article, questions concerning costs and the safety of effluent discharge into the Bristol Channel are raised. (Titus-FRC)

MICROBIAL VIABILITY MEASUREMENTS AND ACTIVATED SLUDGE KINETICS,
Oregon State Univ., Corallis. Dept. of Civil Engineering.
P. O. Nelson, and A. W. Lawrence.
Water Research, Vol 14, No 3, p 217-225, March, 1980. 6 Fig, 4 Tab, 39 Ref, 1 Append.

Descriptors: *Waste water treatment, *Model studies, *Biological treatment, *Activated sludge, Sewage bacteria, Organic matter, Adenosine triphosphate, Spectrometry, Laboratory tests, Kinetics, Slurries, Suspended solids, Volatility, Biodegradation, Waste treatment, Microorganisms, Biomass.

A laboratory investigation was conducted to determine the influence of microbial viability data on a frequently used steady-state kinetic model of slurry-type process of biological waste-water treatment. The luciferin-luciferase firefly lantern extract method coupled with a liquid scintillation spectrometer was used to measure adenosine triphosphate (ATP) levels as an indication of microbial viability. The microbial viability of activated sludge mixed liquor volatile suspended solids (MLVSS) was found to have a functional relationship with the retention time of the biological solids. Microbial viability of the MLVSS was essentially 100% at low bilogical solids retention times. Conversely, at higher values of biological solids retention time characteristic of normal activated sludge processes, The MLVSS microbial viability decreased to nearly a constant value. Microbial viability of the MLVSS also affected values of the model coefficients. It was concluded from mass balance studies and ATP values that the MLVSS of an activated sludge system treating a soluble organic waste could be composed of three distinct systems, namely active or viable microbial solids, inert microbial debris solids, and nonviable biodegradable microbial solids. LABORATORY APPLICATION OF SECONDARY SEWAGE EFFLUENT TO ARGILLACEOUS LIMESTONE,
Guam Univ., Agana. Water Resources Research Center.
P. A. Cowan, and R. N. Clayshulte.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-137739, Price codes: A04 in paper copy, A01 in microfiche. Technical Report No 18, 1980. 56 p, 14 Fig, 10 Tab, 44 Ref, 2 Append. OWRT B-002-GUAM(1), 14-34-0001-9066.

Descriptors: Sewage, *Sewage treatment, Sewage disposal, *Limestones, Sewage effluents, River, *Water quality control, Laboratory tests, Nutrient removal, Guam, Mariana Islands, Micronesia.

Secondary sewage effluent and river water (control) were applied to a series of laboratory lysimeter columns containing argillaceous limestone. Nitrates naturally deposited in the limestone were leached after semi-continuous water loading. Mass balance data of river water percolate with low nutrient input levels showed nitrogen removal and phosphorus release. Phosphorus release was attributed to fine particulate matter flushed from the lysimeters. River water leachate was generally high quality. Sewage effluents with high nitrate concentrations leached through the limestone media yeilding mean percolate concentrations of 8.0 plus or minus 0.4 and 14.3 plus or minus 8.7 mg/l at a depth of 2.74 m. the limestone was unable to remove nitrogen. Phosphorus was initially stripped from the sewage effluent with 76 to 90% removal after percolating through 2.74 m of limestone media. Phosphorus breakthrough occurred in the top 0.91 m of limestone after 70l of water loading. The estimated phosphorus adsorption capacity was low at 0.011 kg P/m sup 3. Coliform bacteria removal efficiencies in the sewage runs were >95% at the 0.91 m depth and >99% at the 1.83 m depth. In relation to the limestones' inability to remove nitrogen and phosphorus, the limestone infiltration/percolation system was concluded to be a disposal option and not a treatment alternative.

Descriptors: *Waste treatment, *Chlorination, *Membrane processes, *Reverse osmosis, *Water quality control, *Membranes, Water treatment, Water quality, Liquid wastes, Research and Development, Chemical reactions, Water purfication, Thin films, Filters, Disinfection, Degradation(Decomposition), Sulfur compounds, Sulfonates, Treatment facilities.

Disclosure of the first asymmetric cellulose acetate reverse osmosis (R0) membrane stimulated considerable interest in synthetic polymeric membranes Commercial diaminophenylindane (DAPI) polyimides had specified properties indicative that they could be modified and converted into chlorine-resistant R0 membranes of both integrally skinned (asymmetric) and ultrathin film composite types, but DAPI-based polyamides showed a lack of resistance to degradation by both chlorine and chlorosulfonic acid. New support membranes of poly(butylene terephthalate), PBT, were shown to be resistant to chlorine and most organic solvents, and more wettable than polysulfone membranes. Membranes of PBT may prove an attractive alternative to polysulfone supports, especially if a replacement for the expensive hexafluoroisopropanol solvent can be found. PBT membrane pore size could be controlled by air velocity adjustment above the nascent membrane. Further, it was concluded that sulfonation was generally unsuited for increasing hydrophobic membrane polymer hydrophilicity, and that anionic-exchange type ionogenic R0 membrane polymers were superior to cationic types in both processing and end-use characteristics. Thus, future work will focus on polymers bearing quaternary ammonium groups, rather than sulfonate groups. (Zielinski-IPA)

A VARIABLE-DISCHARGE MODEL FOR FACULTATIVE OXIDATION PONDS,
Georgia Inst. of Tech., Atlanta. School of Civil Engineering.
F. M. Saunders, and E. P. Minchew.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-142135, Price codes: A07 in paper copy, A01 in microfiche Environmental Resources Center, Georgia Institute of Technology Report ERC 04-80, June 1980. 122 p, 29 Fig, 7 Tab, 49 Ref, 1 Append. OWRT-A-076-GA(1).

Descriptors: *Mathematical models, *Ponds, *Oxidation lagoons, Discharge frequency, Rural areas, *Waste water treatment, Discharge(Water), Release, Outflow, Water quality control, Streams, Economic feasibility, Water purification, Water

pollution control, Wastes, Permits, Legal aspects, Waste treatment.

Waste water treatment facilities are granted discharge permits based on the ten-year seven-day low flow of the receiving stream; the low value for this parameter requiring that facilities be capable of achieving a high degree of waste water contaminant reduction. The costs associated with supplying a high degree of treatment and the expertise needed to operate such a system are generally lacking in small rural communities. This study demonstrated that a facultative oxidation pond operating according to a variable discharge schedule would be well-suited to rural communities. Lagoon discharge would be reduced to a minimum level during periods of low assimilative capacity of the stream; when the stream could receive heavier wasteloads without water quality degradation below specified standards, the excess lagoon accumulation volume would be gradually released, with the lagoon going through a complete cycle once a year. Such a variable-discharge oxidation pond would provide an economic/technically-feasible alternative for rural communities. The initial implementation cost is significantly lower than that of other processes capable of higher degrees of treatment, and the greater land availablity in rural areas is well-suited to lagoon construction. A field application study of the proposed model was recommended. (Zielinski-IPA)

An increased efficiency was verified experimentally for the drying of anaerobically-digested waste water sludge on a sand bed, using a simple shed roof of translucent corrugated fiberglass. A closed cover designed in the manner of a solar collector and featuring forced ventilation was constructed of light weight materials, and observed for several months prior to destruction by an unprecedented fall of pellet snow. Drying of sludge on suspended screens was shown to be very rapid. Enlargement of this study could provide for fabrication of more substantial covers, each placed on a separate drying bed. The solar-distiller type cover remains the most likely to provide a much-needed efficiency increase in drying beds for waste water sludges. It is possible that a screen arranged as a wide conveyor belt might be periodically loaded at one end and unloaded at the other. If the drying was enhanced by a solar cover or otherwise, a rate as much as four times normal might be achieved, based on the premise of rate-doubling due to enhancement plus exposure of twice as much sludge surface. Further study was recommended to fully evaluate the potential of solar-collector type covers for sludge drying beds. (Zielinski-IPA)

RAPID ASSAYS FOR MICROBIAL DEGRADATION OF 2-CHLOROPHENOL,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Chemical Engineering.
H. S. Pal, T. Murphy, A. C. Carter, and S. W. Drew.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-137929, Price codes: A03 in paper copy, A01 in microfiche. Virginia Water Resources Research Center, Virginia Polytechnic Institute and State University, Bulletin 128, November, 1980. 31 p, 1 Fig, 5 Tab, 16 Ref. OWRT-B-088-VA(1).

Descriptors: *Chlorinated hydrocarbon pesticides, *Phenols, *Analytical techniques, *Microbial degradation, *Activated sludge, Halogenated pesticides, Organic compounds, Aromatic compounds, Chemical wastes, Chemicals, Industrial wastes, Water pollution, Water pollution sources, Gas chromatography, Cultures, Creosote, Waste treatment, Treatment facilities, Bactericides, Waste water(Pollution).

Standard agar and liquid culture techniques for evaluation of pure/mixed microbial cultures could be modified for estimations of microorganism resistance to and degradation of 2-chlorophenol (2-CP). The modified techniques should be useful in predicting the ability of waste treatment facilities to handle pulsed loads of 2-CP, and may be extended to other toxic compounds. Microorganisms for this study were from activated sludge from the Roanoke, Virginia, sewage treatment plant, and from a soil sample from an area used for creosote-coated lumber storage. The most powerful assay was a modified most-probable-number indicator assay, which allowed correlation of 2-CP resistant and 2-CP degrading subpopulations of a culture by differential reading at 18 and 36 hours. This assay confirmed the expected changed in microbial subpopulations that occur during acclimation of cultures to 2-CP. Determinations of 2-CP and phenol were made by gas chromatographic analysis and a distillation aminoantipyrine condensation-oxidation colorimetric method. The culture assay techniques were used to study shifts in microbial subpopulations identified as sensitive or resistant to the toxic effects of 2-CP. Increased resistance to 2-CP paralleled the increased 2-CP degrading capability of the subpopulations. Rapid and accurate estimation of 2-CP resistance/degradation was possible. (Zielinski-IPA)

FEASIBILITY OF PURIFICATION AND CONCENTRATION OF SELECTED WASTEWATER STREAMS BY ULTRAFILTRATION,
Mississippi State Univ., Mississippi State. Dept. of Chemical Engineering.
G. R. Lightsey, and N. Espinoza.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-142267, Price codes: A03 in paper copy, A01 in microfiche. Water Resources Research Institute, Mississippi State University Completion Report, October 1980. 31 p, 13 Fig, 7 Tab, 16 Ref. OWRT-A-130-MISS(1), 14-34-0001-0126.

Descriptors: *Filtration, *Water purification, *Waste water treatment, *Membranes, *Industrial wastes, Equipment, Water clarification, Water pollution treatment, Water quality control, Water treatment, Filters, Water quality, Research and development, Wastes, Organic matter, Suspended solids, Chemical oxygen demand, Laboratory tests, Facilities, Feasibility, Project planning.

A laboratory scale study was conducted to determine the feasibility of using ultrafiltration (UF) to purify waste water streams and concentrate the waste contents, for ultimate application to waste water streams such as in pulp/paper mills, hardboard plants, and cheese whey processing plants. Such industries place heavy loads on waste water treatment facilities due to the often significant amounts of high molecular weight organic matter in their waste waters. A batch-type UF process was used to concentrate cheese whey (CW), prehydrolysate (PH), and wood sugars (WS); producing protein, lactose and carbohydrate byproducts while reducing the effluent COD. The system used a commercial batch UF system equipped with Diaflow membranes and having a 2-liter capacity. The CW, PH, and WS were concentrated from 69, 47, and 21 grams/liter to 93, 71, and 60 grams/liter of solids, respectively. During the concentration run, 82, 68, and 88% by volume of the starting feed were recovered in the permeate. The COD reduction of CW, PH, and WS permeates ranged from 92-97% of initial values. Initial COD values of 60,000, 130,000, and 119,000 ppm were reduced to less than 2,000, 6,000, and 9,000 ppm, respectively. Thus, UF determined as an effective process for purification and for organic waste concentration of such waste water streams. (Zielinski-IPA)

SEVENTH ANNUAL REPORT: GREAT LAKES WATER QUALITY.
International Joint Commission, United States and Canada, Windsor (Ontario).
October, 1980. 101 p, 2 Fig, 5 Tab, 3 Append.

Descriptors: *Great Lakes, *Water quality, *International commissions, *Canada, *United States, North America, Bodies of water, Lakes, Great Lakes region, Waste disposal, Waste water(Pollution), Waste treatment, Treatment facilities, Legal aspects, Municipal wastes, Effluents, Industrial wastes, Pollutants, Toxins, Water pollution, Radio-active wastes, Water quality control.

This report marked the transition between the United States/Canada International Joint Commission's activities under the 1972 Great Lakes Water Quality Agreement (GLWQA) and those under the 1978 agreement, and presented an overview and lake-by-lake description of water quality in the Great Lakes Basin during 1978. Problems that arose from industrial/municipal wastes included toxic/hazardous substances and wastes disposal, phosphorous and eutrophication, long-range transport of air-borne pollutants and radioactivity. Topics of Great Lakes surveillance, Commission institutions and new directions under the 1978 Agreement were also covered. The Commission recommended that governments provide a complete inventory of all point source dischargers in the Basin; that improved municipal waste treatment plant efficiency be sought by using optimum operating/maintenance procedures and by upgrading operator skills; that priority be given to complete programs for abatement and control of dischargers of municipal waste waters to the Great Lakes System; and that all jurisdictions use the General and Specific Objectives of the 1978 GLWQA as minimum requirements in granting discharge permits or similar approvals. Governmental sponsoring of an experimental mapping project as also recommended to identify problems/benefits associated with environmental mapping. (Zielinski-IPA)

M. H. Weintraub, M. A. Dzieciuch, and R. L. Gealer.
U.S. Patent No 4,194,972, 5 p, 4 Fig, 13 Ref; Official Gazette of the United States Patent Office, Vol 992, No 4, p 1380, March 25, 1980.

Descriptors: *Patents, *Waste water treatment, *Water pollution treatment, *Oil pollution, Oily water, Emulsions, Separation techniques, Electrolysis, Oxidation, Foam separation.

A method is disclosed for breaking an oil-in-water emulsion. The method includes the following general steps. A porous ferrous ion producing anode is established. A supply of the oil-in-water emulsion is located on one side of the anode and a fixed volume of the emulsion is flowed through a fixed cross sectional area of the anode per unit of time. Less than a passivating current is flowed through each unit area of the anode per unit of time thereby dissolving into the emulsion ferrous ion in sufficient quantity to break the emulsion. This results in a homogeneous dispersion of the ferrous ions in the fixed volume of the emulsion. There is an in situ generation of hydroxyl ion at the cathode and tiny air bubbles are introduced near the electrodes to oxidize the ferrous ions to ferric ions. The ferric ions are then permitted time to break the emulsion and remove the oil. This oil floats to the top surface in a froth and is removed. (Sinha - OEIS)

METHOD OF LOWERING THE COLOR OF EFFLUENT WHICH CONTAINS ARYL AZO- OR ARLY NITRO-CONTAINING COMPOUNDS,
American Color and Chemical Corp., Charlotte, NC. (Assignee).
R. E. Smith.
U.S. Patent No 4,194,973, 5 p, 12 Ref; Official Gazette of the United States Patent Office, Vol 992, No 4, p 1380, March 25, 1980.

Descriptors: *Patents, *Waste water treatment, *Water pollution treatment, *Color, Industrial wastes, Chemical reactions, Separation techniques, Metals, Bactericides.

Effluent which contains aryl azo- and/or aryl nitro-containing compounds is treated to remove the color by contacting the effluent with Fe(II) in the presence of iron at a temperature and for a time sufficient to cause reduction of the aryl azo and aryl nitro groups of the effluent. Effluent containing metallized compounds may be treated in the same manner and then subjected to alkaline neutralization to remove the metal from the effluent. (Sinha -OEIS)
W81-00712

KRAFT PULP BLEACHING AND RECOVERY PROCESS,
Scott Paper Co., Philadelphia, PA. (Assignee).
R. P. Singh.
U.S. Patent No 4,196,043, 4 p, 12 Ref; Official Gazette of the United States Patent Office, Vol 993, No 1, p 233, April 1, 1980.

Descriptors: *Patents, *Waste water treatment, Water pollution, Industrial wastes, Bleaching wastes, Pulp and paper industry, Recirculated water, Water reuse, Water utilization, Chemical recovery.

In this invention Kraft pulp is bleached to a high brightness by a bleaching sequence comprising from one to about three treatments with ozone, and a final treatment with an alkaline peroxide solution, the bleach treatments being separated by an alkaline extraction. The effluent from each of the bleach treatments is collected and either, recycled and utilized in subsequent bleaching operations thereby reducing the amount of fresh water required, or introduced into the chemical recovery system of a Kraft pulping process thereby eliminating pollution which would otherwise be caused by dumping these effluents. (Sinha - OEIS)
W81-00718

SEWAGE TREATMENT,
BOC Ltd., London (England). (Assignee).
M. E. Garrett, and K. C. Smith.
U.S. Patent No 4,196,074, 4 p, 2 Fig, 2 Ref; Official Gazette of the United States Patent Office, Vol 993, No 1, p 241, April 1, 1980.

Descriptors: *Patents, *Waste water treatment, *Sewage treatment, Oxygenation, Sewers, Water pollution treatment, Equipment.

In order to reduce the likelihood of the formation of hydrogen sulphide in the sewer and to reduce the amount of further treatment required to be carried out on sewage, oxygen containing gas is dissolved in sewage passing to, or through, a sewer during periods of pumping. A stream of the sewage is withdrawn during periods when sewage is being held in the sewer. This stream is passed through a conduit so as to promote dissolution of oxygen-containing gas introduced into, or entrained in, the stream. The stream is then returned to the sewer. By this means a chosen concentration of dissolved oxygen may be maintained in the volume of sewage between the points of withdrawal and return of the stream. (Sinha - OEIS)

COMBINATION OF A BIOLOGICAL DRY TOILET AND A BIOLOGICAL WASTE WATER PURIFYING PLANT,
Asko-Upo Oy, Lahti (Finland). (Assignee); and AGA Heating A. B., Geoteborg (Sweden). (Assignee).
T. T. Salokangas, U. T. Lammi, and T. J. Miettinen.
U.S. Patent No 4,196,082, 4 p, 1 Fig, 9 Ref; Official Gazette of the United States Patent Office, Vol 993, No 1, p 244, April 1, 1980.

Descriptors: *Patents, *Waste water treatment, *Water pollution treatment, Biological treatment, Domestic wastes, Soil disposal fields, Filtration, Equipment, Dry toilets.

In a combination of a biological dry toilet and a biological waste water purifying plant the heat and coarse sludge of the so called grey water from households is recovered in the dry toilet to which also the fine sludge from the waste water purifying plant is pumped. The heat obtained is used for heating the compost and both sludges collected in the filters are from time to time combined to compost them together with the other waste in the dry toilet. A suction fan in the dry toilet also sucks the air needed by the biofilter through the filter bed. The purified water obtained from the waste water purifying plant is absorbed in the soil. (Sinha-OEIS)
W81-00723

THE EFFECT OF DISSOLVED OXYGEN CONCENTRATION ON NITRIFICATION,
California Univ., Los Angeles. School of Engineering and Applied Science.
M. K. Stenstrom, and R. A. Poduska.
Water Research, Vol 14, No 6, p 643-649, June, 1980. 3 Fig, 1 Tab, 50 Ref.

Descriptors: *Dissolved oxygen, *Nitrification, *Kinetics, *Reviews, *Biological treatment, Aquatic bacteria, Waste water treatment, Sewage bacteria, Sewage treatment, Activated sludge, Retention, Laboratory tests, Diffusion, Flocculation, Theoretical analysis, Variability, Natural streams, Aeration, Rates.

A review of the literature on the effects of dissolved oxygen (D0) levels on the rate of nitrification is presented, and the mechanisms which could be responsible for the variability in the reported findings are evaluated. Research has been conducted in both pure and mixed cultures and in cultures isolated from wastewater treatment systems. Data from all sources indicate that the maximum growth rates of nitrification reactions are affected by D0 levels over the range of 0.3 milligrams/liter to as much as 4.0 milligrams/liter. Conflicting results arise from studies revealing D0 levels of 4.0 milligrams/liter for maximum nitrification rates, while other experiments show achievement of maximum nitrification rates at only 0.5 to 1.0 milligram/liter of D0. These variations in results have been attributed to the effects of oxygen diffusion in flocs, differences in measure results due to steady-state and dynamic measuring methods, and epecially double-substrate limited kinetics. (Geiger-FRC)
W81-00729

A COMPARISON OF MODELS FOR COMPLETELY MIXED ACTIVATED SLUDGE TREATMENT DESIGN AND OPERATION,
Centre Belge d'Etude et de Documentation des Eaux, Liege.
L. Vandevenne, and W. W. Eckenfelder, Jr.
Water Research, Vol 14, No 6, p 561-566, June, 1980. 6 Fig, 25 Ref.

Descriptors: *Activated sludge, *Sludge treatment, *Design, *Mathematical models, *Essential nutrients, Organic matter, Wastes, Suspended solids, Physical properties.

Two models for completely mixed activated sludge treatment design and operation are compared. With the exception of the varible for influent substrate concentration, they are similar in concept. Both the McKinney, Eckenfelder model and the Lawrence, McCarty model incorporate substrate removal, effect of initial substrate concentration, and nutrient requirements. A statistical analysis of performance data for both models showed a slightly better correlation coefficient for the Eckenfelder model, which includes the variable for influent substrate concentration. This variable is significant in determining the retention time necessary to achieve removal of biochemical oxygen demand and to maintain food/microorganism ratios. It may affect design considerations for industrial wastewater treatment facilities. However, more research is necessary to determine the significance of influent substrate concentration on the removal rate in most activatd sludge processes. (Titus-FRC)
W81-00730

CONCENTRATION OF IMPURITIES BY PROGRESSIVE FREEZING,
Chalmers Univ. of Technology, Geoteborg (Sweden). Dept. of Chemical Engineering Design
R. Halde.
Water Research, Vol 14, No 6, p 575-580, June, 1980. 9 Fig, 10 Ref.

Descriptors: *Water purification, *Solutes, *Ice, Freeze-thaw tests, Crystallization, Laboratory tests, Ice-water interfaces, Wastes, Suspended load, Temperature, Desalination processes, Sludge treatment.

The method of purifying water by freezing is discussed. It is based on the fact that ice crystals built up from aqueous solutions are composed of pure water, while impurities remain in liquid state. Thus, it has application for concentating wastes and for desalination. Experimentation with freezing rate, applied shear forces and added chemicals reveals that each affects impurity migration. Intense stirring of the liquid phase provides for higher degrees of purification. Purfication is slightly increased by increased rate of freezing. Particles greater than .000005 m in size are more easily separated. In application to sludge, it was found that raw and dewatered sludge can produce an impurity concentration less than .03%, while thickened, digested sludge diluted with pure water rendered the best separation, due to reduced particle size. The addition of a polymer to the liquid phase improved migration during freezing. (Titus-FRC)

CHARACTERISTIC EVALUATION OF TRICKLING FILTER PROCESS,
Tokyo Inst. of Tech. (Japan). Research Lab. of Resources Utilization.
Y. Hosono, H. Kubota, and Y. Miyaji.
Water Research, Vol 14, No 6, p 581-590, June, 1980. 16 Fig, 4 Tab, 23 Ref.

Descriptors: *Trickling filters, *Waste water treatment, *Numerical analysis, Filters, Flow rates, Biochemical oxygen demand, Equipment, Water quality control, Equations, Temperature, Microorganisms, Hydraulics.

A method is proposed for prediction of the biochemical oxygen demand removed from wastewater in the trickling filter process. The method involves calculations dependent on type of media, surface area of the filter bed, superficial liquid flow rate and influent biochemical oxygen demand. Operating conditions of both standard and high-rate trickling filters for wastewater were experimentally determined. Results indicate that higher fractions of biochemical oxygen demand removal are obtained with increased liquid recycle ratios. Power economy, defined as removal rate per unit power consumption, decreases significantly with increased loading of the filter. Standard trickling filters with a liquid recycling ratio of 0 give higher power economy values at lower loadings, while high-rate filters with a higher ratio are advantageous at higher loadings. The absolute values of power economy are relatively low in

comparison with the activated sludge process. (Titus-FRC)

BIODEGRADABILITY DETERMINATIONS IN TRICKLING FILTER UNITS COMPARED WITH THE OECD CONFIRMATORY TEST,
Henkel KGaA, Duesseldorf (Germany, F. R.). Dept. of Ecology.
P. Gerike, W. K. Fischer, and W. Holtmann.
Water Research, Vol 14, No 7, p 753-758, July 1980. 1 Fig, 1 Tab, 7 Ref.

Descriptors: *Analytical techniques, *Biodegradation, *Trickling filters, *Testing procedures, Mathematical studies, Carbon, Activated sludge, *Sewage treatment, Laboratory tests, Settling basins, Sewage bacteria, Biological treatment.

The sensitivity, reproducibility, and tolerance limits as well as the advantages and problems of the coupled units test, a modified version of the OECD Confirmatory Test, were examined. The method has been applied to trickling filters with square wave feeding tests and a new transinoculation procedure. Reproducibility of the method for determining the biodegradability of environmental chemicals is generally good. The COD and DOC removals for various compounds in the coupled units test were investigated. Tolerance limits width was found to be dependent upon the number of determinations and the test concentration. Due to the success of transinoculation in the trickling filters accomplished by the simple exchange of effluents from the test and parallel units, the same procedure was tried in the conventional coupled units test in the OECD Confirmatory Test by exchanging liquid out of the settling tank rather than out of the activated sludge vessel. The advantage of this step was that no material adsorbed on the sludge could be transferred from the test unit to the parallel unit in the transinoculation procedure. The two major contributors to the tolerance limits were analytical and biological variance. Mathematical studies offered clues for improving the method. (Geiger-FRC)

ON FARM AEROBIC TREATMENT OF PIGGERY WASTE. THE EFFECT OF RESIDENCE TIME AND STORAGE ON EFFLUENT QUALITY,
North of Scotland Coll. of Agriculture, Aberdeen (Scotland).
D. R. Fenlon, and P. J. Mills.
Water Research, Vol 14, No 7, p 805-808, July, 1980. 4 Tab, 14 Ref.

Descriptors: *Farm wastes, *Aerobic treatment, *Livestock, *Organic wastes, Effluents, Water quality, Chemical oxidation demand, Waste disposal, Feedlots, Denitrification, Suspended solids, Farm lagoons.

A description of the effect of reducing the residence time of screened pig slurry in a pilot scale oxidation ditch is presented. The soluble organic fraction was significantly reduced by conversion to suspended solids and organic nitrogen at reduced residence times and by mineralization at long residence times. Desorption and denitrification caused high losses of inorganic nitrogen during the treatment process. A laboratory system using the same waste at a controlled loading rate demonstrated that the amount of oxygen demand lost per day was constant, and confirmed that the residence time determined whether mineralization or solids production occurred. Over-winter storage of aerobically treated waste resulted in a small increase in soluble COD; however, it remained far more acceptable for land disposal than untreated material. (McKeon-FRC)

EFFLUENT TREATMENT AND ALGAE RECOVERY BY OZONE-INDUCED FLOTATION,
Israel Inst. of Tech., Haifa. Environmental and Water Resources Engineering.
N. Betzer, Y. Argaman, and Y. Kott.
Water Research, Vol 14, No 8, p 1003-1009, August, 1980. 7 Fig, 4 Tab, 14 Ref.

Descriptors: *Ozone, *Oxidation lagoons, *Flotation, *Water purification, *Algae, Waste water treatment, Coliforms, Separation techniques, Foaming, Frothing, Sewage treatment, Suspended solids.

In studies concerned with disinfection of stabilization ponds effluents, algal separation by ozone-induced flotation was observed. In the present study, the practical application of this phenomena was investigated on a bench-scale flotation column using oxygen enriched with ozone. A clear colorless liquid resulted from the process with over 98% removal of suspended solids. Fecal coliforms were reduced up to three orders of magnitude by the process. Usual ozone dosages required ranged from 15 to 50 mg/liter. The froth that resulted thickened to form a pure algal mass composed of 8.5% solids. The reaction of ozone with algal cells was shown to form a hydrophobic surface which could be separated by bubbling. The thickened algal froth formed a valuable product. Liquid effluents could then be disinfected without formation of hazardous chlorinated organics. The process offers an attractive approach to waste-water treatment under certain circumstances. (Geiger-FRC)

EVALUATION OF OZONE INDUCED BIODEGRADABILITY OF WASTEWATER TREATMENT PLANT EFFLUENT,
Technion - Israel Inst. of Tech., Haifa. Environmental and Water Resources Engineering.
N. Narkis, and M. Schneider-Rotel.
Water Research, Vol 14, No 8, p 929-939, August, 1980. 13 Fig, 3 Tab, 12 Ref.

Descriptors: *Biodegradation, *Ozone, *Sewage effluents, Biological treatment, *Waste water treatment, Lime, Sewage bacteria, Organic wastes, Oxidation, Costs, Pilot plants, Hydrogen ion concentration.

A method was tested for the quantitative determination of biodegradability induced by ozone on refractory organic matter in solution after conventional treatment of wastewater by biological methods and by lime. The long-term BOD test is suitable for aqueous solutions with relatively low levels of organic matter. Seeding of water samples with bacteria was accomplished with filtered effluent of biological treatment plants. COD, total organic carbon, BOD, and dissolved oxygen were measured, as well as nitrification, pH, and changes in bacterial populations. An improvement in biodegradability was found in ozonated samples and was attributed to the removal of inhibitory effects due to changes in molecular structure. Acclimation of ozonated effluents was required in all biodegradability tests. A combination of lime treatment and high pH (11.8) enhanced biodegradability, an effect which was not observed with lime treatment alone. It was suggested that the ozone levels used in these pilot studies were too high to be cost efficient, although they were more than adequate for increasing the level of biodegradability in wastewater effluents. (Geiger-FRC)

5E. Ultimate Disposal Of Wastes

THE SURVIVAL OF SALMONELLAE IN SEWAGE SLUDGE APPLIED TO ARABLE LAND,
North West Water Authority, Warrington (England). Western Div.
D. C. Watson.
Water Pollution Control, Vol 79, No 1, 11-18, 1980. 3 Fig, 3 Tab, 16 Ref.

Descriptors: *Arable land, *Salmonella, *Sewage sludge, Sewage disposal, Ultimate disposal, Spraying, Soil types, Sands, Organic soils, Organic wastes, Sludge digestion, Sludge disposal, Air temperature, Domestic wastes.

The survival of salmonella in sewage sludge applied to arable land in England was investigated. Sludge was mainly of domestic sewage origin and underwent mesophilic digestion which removed 85-95% of salmonella. The digested sludge, containing about 64% organic wastes, was applied at 70 cu m/ha by spraying. Samples of soil and sludge were taken on application, and soil/sludge samples were taken weekly for 10 wk thereafter. The experiment was conducted in April-July 1976 (a hot, dry period) on sandy soil and in May-July 1977 (typical climate) on a similar soil and on a heavier soil containing more organic matter. On application, the sludge contained 300 and 250 salmonella/kg on wet weight in 1976 and 1977, respectively. Numbers of salmonella/kg in the soil/sludge ranged from 0 (wk 7, 8 and 9) to 160 (1 wk) in 1976 and from 0 (wks 6, 8, and 9) to 35 (wk 1) in 1977. Factors affecting salmonella survival in the environment are its physical state, availability of organic matter, environmental temperature (greater survival at 1-5C than at 10-15C), moisture content of surrounding material (they are susceptible to desiccation), pH of soil, rainfall, and sunshine. The logarithmic die-off of the organisms (T90) was similar for both years for the sandy soil (3.6), though that for the heavier soil was 3.0. It is postulated that the variation in T90 between soils was due to numbers originally present or to the nature of the soil. The survival period of salmonella was about 6 wk, but this is dependent on the numbers originally present in sludge and on environmental conditions. (Just-FRC)

WANT NOT, WASTE NOT. SENSIBLE SLUDGE RECYCLING,
Department of the Environment, London (England). Water Engineering.
R. Best.
Water Pollution Control, Vol 79, No 2, p 307-321, 1980. 9 Fig, 1 Append.

Descriptors: *Sludge disposal, *Sewage sludge, *Recycling, *Environmental effects, Cost-benefit analysis, Public health, Waste water treatment, Environmental sanitation, Nutrients, Heavy metals, Incineration, Land management, Organic wastes, Microorganisms, Sludge treatment.

The Chairman of the Department of the Environment's (U.K.) Standing Committee on the Disposal of Sewage Sluge offers his personal approach to sludge disposal in the waste water cleaning process. The safe, effective and economic disposal of sewage sludge is one of the most challenging aspects of waste water disposal. Knowledge of the characteristics of sewage sludge is essential in understanding its handling and disposal. Sludge may contain particulate matter, free water (about 70%), capillary water (2%), floc water (20%) and intracellular water (8%) by some definitions, although the characteristics of a sludge may vary considerably. Objectives for sludge disposal must be clearly defined, and acceptable residual risks must also be taken into account, and recycling of sludge material must be a priority. Substances targeted for reuse or recovery from sludge material include organic matter, nutrients, trace substances, heavy metals, graded mineral particles, and pathogens. Unrecoverable material is usually returned to land via spreading from tankers or spraying from pipes or is discharged to water bodies. Harmful sludge is usually incinerated. New attitudes towards sludge reuse in the future may require reeducation. A discussion follows the article. (Geiger-FRC)
W81-00585

THE DEWATERING OF ACTIVATED SLUDGE: MEASUREMENT OF SPECIFIC RESISTANCE TO FILTRATION AND CAPILLARY SUCTION TIME,
Commonwealth Scientific and Industrial Research Organization, Rockhampton (Australia). Meat Research Lab.
B. V. Kavanagh.
Water Pollution Control, Vol 79, No 3, p 388-398, 1980. 7 Fig, 17 Ref.

Descriptors: *Dewatering, *Activated sludge, *Flow resistance, *Filtration, Waste treatment, Sludge, Regression analysis, Hydraulics, Mathematical models, Sludge treatment, Resistance, Capillary action.

The results of an experimental study aimed at critically assessing the validity of the basic filtration equation developed by Carman in describing the filtration of activatd sludges are presented. The study indicated that with the exception off the role of pressure, the basic filtration equation can be used quanitatively to describe the filtration of biological sludges. The measurement of specific resistance to filtration (SRF) represents the best defined laboratory measurement of sludge dewaterablity currently available. This and other studies also indicated that capillary suction time (CST) measurements are a useful measure of sludge filterability and can be directly related to SRF measurements. The functional dependence of CST measurements on variables such as solids concentration and viscosity is consistent with that expected on the basis of theoretical considerations. It is suggested that an operating pressure of 49.1 kPa (368 mm Hg) be made the standard value for use in the determination of the SRF of biological sludges. (McKeon-FRC)
W81-00613

DISPOSAL OF SEWAGE SLUDGE TO LAND: CHEMICAL AND MICROBIOLOGICAL ASPECT OF SLUDGE TO LAND POLICY,
Yorkshire Water Authority (England). Office of Scientific Services.
J. A. Hudson, and H. Fennel.
Water Pollution Control, Vol 79, No 3, p 370-387, 1980. 33 Ref.

Descriptors: *Sludge disposal, *Land management, *Toxins, *Soil contamination, *Public health, Sewage sludge, Sludge treatment, Nutrients, Cultivation, Heavy metals, Incineration, Pesticide residues, Fertilizers, Organic matter, Lead, Industrial wastes, Animal parasites, Microorganisms, Zinc, Cadmium, Recycling.

The spreading of sewage sludge on farm land poses the problems of adding toxic metals to the soil and spreading organisms that are pathogenic in man and animals. Toxic metals may find their way into farmland soil not only from sewage sludge deposition but from other industrial effluents, by fertilizers, ameliorants, pesticides, or by motor exhaust fumes, pig slurry, or composted refuse. Sampling of farmland soils for analyses for heavy metals was conducted by the Soil Science Laboratories at Leeds, England. Of 210 fields sampled, 16 were considered to be contaminated with zinc (> 250 mg/kg), but it was not certain this was due to sludge disposal. Analyses for cadmium and lead in the Leeds area showed that neither metal was present in quantities that would be toxic according to current standards. Studies have shown that factors such as soil properties, plant species and cultivation practices may influence the amount of metals available to the soil from sewage sludges. Sludges from the Yorkshire area containing toxic levels of heavy metals are incinerated. Addition of sludge to farmland may be beneficial if the sludge contains sufficient nutrients to replace the use of organic fertilizers. Methods are presented for calculating safe field application rates for zinc from sludge to farmlands. An evaluation of the kinetics of microorganisms and beef and pork tapeworm from sewage sludge to farmlands to man and animals is presented. What happens to these organisms during sewage treatment and during sludge application to land is described along with their movement by water courses and underground water sources. A discussion follows the article. (Geiger-FRC)

METHOD FOR STORING WASTE MATERIALS AND THEIR COMBUSTION RESIDUES IN A MANNER HARMLESS TO UNDERGROUND WATER,
H. Egger.
U.S. Patent No 4,194,855, 5 p, 1 Fig, 6 Ref; Official Gazette of the United States Patent Office, Vol 992, No 4, p 1341-1342, March 25, 1980.

Descriptors: *Patents, *Waste storage, *Waste disposal, Underground waste disposal, Subsurface waters, Linings, Sealants, Industrial wastes.

An earth pit is prepared for the storage of waste materials by lining the bottom of the pit with a layer of finely-ground loose material followed by a synthetic plastic sheet resistant to humas, roots and tearing followed by a second layer of finely-ground loose material. The layers of loose material equalize the pressure on the opposite sides of the synthetic plastic sheet. A number of sheets may be solution-welded together for a large pit. A further important property which the sheet should possess is chemical resistance, in particular, resistance to alkali. Particularly suitable for the purposes of the invention are suitably stabilized PVC sheets, in particular, those stabilized with barium/cadmium compounds. (Sinha-OEIS)

5F. Water Treatment and Quality Alteration

DIRECT FILTRATION OF VIRGINIA SURFACE WATERS: FEASIBILITY AND COSTS,
West Virginia Inst. of Tech., Montgomery. Dept. of Civil Engineering.
R. F. McCormick, and P. H. King.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-127391, Price codes: A06 in paper copy, A01 in microfiche. Virginia Water Resources Research Center, Virginia Polytechnic Institute and State University, Blacksburg, Bulletin 129, November 1980. 99 p, 21 Fig, 26 Tab, 40 Ref. OWRT A-081-VA(1).

Descriptors: *Virginia, *Surface waters, *Water supply, *Water treatment, *Filtration, Economics, Feasibility studies, Costs, Filters, Design(Filters).

This research investigated the technical and economic feasibility of the direct filtration technique for treating high-quality Virginia surface waters prior to domestic use. One of the flow schemes that was investigated eliminates the sedimentation basin while employing a full, conventional flocculation period. Another eliminates separate sedimentation and flocculation units altogether. Major variables that were assessed in terms of their effects on direct filtration performances included raw water characteristics such as turbidity, color, total dissolved solids, total hardness, algae count, and total coliform count; filter design variables such as type and size of media (two dual media filters and one trimedia were evaluated); and operating variables such as hydraulic loading rate and nature and dosage of applied coagulant. The most effective filtration scheme consisted of a three minute rapid mix with alum and cationic polymer as primary coagulants, followed by filtration at a 5 gallons per minute/sq ft loading rate through 20 inches of 1.3-mm effective size anthracite coal and 10 inches of 0.45-mm effective size silica sand. Color and algae concentrations had definite effects upon the direct filtration process. Results from the study show that raw waters with turbidities less than 10 NTU, color less than 15 APHA units, and algae concentrations less than about 1,000 colonies/ml should be excellent candidates for economical treatment by direct filtration.
W81-00501

FLUSHING SYSTEM FOR REVERSE OSMOSIS WATER PURIFICATION UNITS,
W. A. Parkinson.
U.S. Patent No 4,193,872, 5 p, 2 Fig, 4 Ref; Official Gazette of the United States Patent Office, Vol 992, No 3, p 1004, March 18, 1980.

Descriptors: *Patents, *Water treatment, *Water purification, Separation techniques, *Reverse osmosis, Domestic water, Membranes, Flushing.

A reverse osmosis water purification system for home usage is flushed periodically automatically by actuation of a non-related apparatus. In one embodiment, the reverse osmosis cartridge is mounted directly in the cold water line to a sink, so that water passes through the cold water inlet through the contaminated water outlet to the cold water faucet to the sink, flushing contaminants out of the cartridge through the faucet when the faucet is opened. In another embodiment, flushing is actuated by a solenoid-operated valve electrically connected to a garbage disposal switch. (Sinha - OEIS)

THE EFFECTS OF PERMANGANATE PRETREATMENT ON TRIHALOMETHANE FORMATION IN DRINKING WATER,
North Carolina Univ. at Chapel Hill.
P. C. Singer, J. H. Borchardt, and J. M. Colthurst.
Journal of the American Water Works Association, Vol 72, No 10, p 573-578, October, 1980. 11 Fig, 8 Ref.

Descriptors: *Chlorination, *Water treatment, *Organic compounds, Disinfection, Surface waters, Halogens, Potable water, Oxidation, Water pollution, Permanganate.

The effects of permanganate pretreatment on trihalomethane formation in drinking water were examined in water samples collected from the surface waters of Chapel Hill and Durham, North Carolina. Samples were treated with permanganate with a controlled quenching procedure to minimize the addition of excess sulfite. Quenched samples were filtered to remove manganese dioxide and then were stored until chlorination. Chlorine was added at pH 7 and sample bottles were sealed. Aliquots were sampled from each bottle and titrated amperometrically with PAO to determine the residual free chlorine concentration. Permanganate had a relatively minor effect on the subsequent chlorine demand of the water. Permanganate reactivity in the water was found to be a function of raw water quality, pH and permangante dose. The chloroform formation potential of water samples was decreased by permanganate treatment in a manner which was proportional to the amount of permangante consumed after the immediate oxidant demand of the water was met. Permanganate had little effect on chloroform production when used at the doses typically employed for water pretreatment. Larger doses would be required to reduce the formation of trihalomethanes in practice. When permanganate is used for oxidative pretreatment purposes, chlorine may be added as a post-treatment procedure after filtration so that chlorine is added to a cleaner water with fewer precursorsof trihalomethane. (Geiger-FRC)
W81-00570

DRINKING WATER CHLORINATION: A PRACTICE UNRELATED TO CANCER MORTALITY,
Massachusetts Univ., Amherst. Dept. of Environmental Health.
R. W. Tuthill, and G. S. Moore.
Journal of the American Water Works Association, Vol 72, No 10, p 570-573, October, 1980. 1 Fig, 2 Tab, 27 Ref.

Descriptors: *Potable water, *Chlorination, *Cancer, Human diseases, Public health, Disinfection, Water purification, Toxicity, Epidemiology, Massachusetts, Social aspects.

The charge that chlorination of drinking water has been linked positively to increased incidence of cancer of the stomach and rectum has been reevaluated. Massachusetts communities having public water supplied from surface sources in 1949 whose

population growth did not exceed 25% between 1950-1970 were investigated. Measurements were made of the average chlorine dose used in the past, recent trihalomethane levels in the water, and recent doses of chlorine. Cancer mortality data from 1969 to 1976 was used. U.S. census records supplied sociodemographic information for each community, including median family income, educational level, percent of nonwhite and foreign-born residents, and percent population change. The data indicated that the initially significant correlations between the levels of trihalomethanes in drinking water and incidence of colon or rectal cancer disappeared after controlling for ethnicity in the first case and foreign-born residents in the latter case. It is suggested that studies linking stomach and rectal cancer to chlorination of drinking water may have been premature in that they did not include socioeconomic variables in their analyses. AN EMPIRICAL KINETIC MODEL OF TRIHALOMETHANE FORMATION: APPLICATIONS TO MEET THE PROPOSED THM STANDARD,
Montgomery (James M.), Inc., Pasadena, CA.
M. C. Kavanaugh, A. R. Trussell, J. Cromer, and R. R. Trussell.
Journal of the American Water Works Association, Vol 72, No 10, p 578-582, October, 1980. 11 Fig, 22 Ref.

Descriptors: *Potable water, *Chlorination, *Model studies, *Water pollution sources, *Organic compounds, Disinfection, Bromides, Surface waters, Ammonia, Nitrogen compounds, Water treatment, coagulation, Water purification, Organic loading, Standards, Chemical reactions.

When a chlorine is used for disinfection of drinking water, the approach to the reduction of trihalomethane (THM) production has been to reduce the potential for formation of THM prior to chlorination or to remove THM after formation. Due to the complexity of the reactions of chlorine with other organic molecules in water, few kinetic models of THM formation have been formulated. The present study presents a semiempirical reaction rate model for THM formation based on the overall reaction stoichiometry. THM formation is described by a single-rate expression, and an analytical framework for evaluating the THM formation potential in water is provided. The model, which is still in the developmental stage, is a two-parameter kinetic model that allows estimation of the acceptable effluent total organic content (TOC) that must be achieved. Coagulation or GAC adsorption are used when chlorine is applied as a postdisinfectant. Optimum coagulation and reduced chlorine dose will ensure that proposed standards of 100 micrograms/liter total THM are met in surface waters with TOC values of 3-4 milligrams/liter and low bromide levels. The dependence of the THM formation rate on the applied chlorine dose as well as the effect of bromide, ammonia and organic nitrogen indicate that a standard procedure for estimating THM formation potential in a water supply would be difficult to achieve. REBUILDING LENGTHENS FILTER RUNS FOR ALGAE-PLAGUED UTILITY,
Gary-Hobart Water Corp., Gary, IN.
K. Young.
American City and County, Vol 95, No 6, p 40-41, June, 1980. 1 Fig.

Descriptors: *Filters, *Potable water, *Algae, Diatoms, Sands, Coals, Turbidity, Costs, Municipal water, Water purification, Water treatment.

Sand filters with a 2-3 gpm/sq ft filtration rate were designed to improve water quality in the Gary, Iniana drinking water supply system. However, filter runs soon dropped from 35-40 hr to as little as 3 hr during the summer's high filtration rates due to an abundance of algae, predominatly diatoms. As a solution to the problem, 6-inch caps of 0.85- to 0.90-mm anthracite were placed on four of the six filters. One filter was converted to a dual media bed of sand (6 inches) and anthracite (18 inches), while the sixth remained as a control sand filter. Four turbidimeters were installed to monitor the water and the filters. The performance of the dual media filter was equal to that of the capped filter, and the former was capable of storing greater quantities of tubidity at a low head loss. These two types of filter performed as well or better than the sand filter and allowed filter runs to double or triple. All filters were also checked for gravel mounding. Since that tie, the filters have been rebuilt to incorporate the dual media design at a rate of one a year. Filter runs now average 70-80 hr during summer high pumpage periods and the amount of wash water needed has been reduced. Costs have also been reduced. However, the deep anthracite bed and the polyelectrolyte addition requires a longer wash to break up the heavy floc and move it up and out of the filter. (Baker-FRC)

INDUSTRIAL SURCHARGES THAT INDUSTRY LIKES,
Burgess and Niple Ltd., Columbus, OH.
H. R. Stonerook, and R. E. Birkbeck.
American City and County, Vol 95, No 5, p 63-65, May, 1980. 2 Fig, 1 Tab.

Descriptors: *Municipal water, *Industrial wastes, *Water rates, Prices, Food processing industry, Water pollution sources, Waste water treatment, Monitoring, Costs, Biochemical oxygen demand, Sewage treatment, Inflow, Legislation.

Orrville, Ohio (population 7,850) has enacted an ambitious industrial monitoring program which allows fair distribution of the costs involved in treating polluted water. About 70% of the city's waste water treatment revenue comes from nondomestic users of the water supply. Orrville contains 23 major industrial plants and processes and sanitizes waste streams from all but one of these plants. Four of the plants are food processors, contributing 24% of the flow and 70% of the BOD to the city treatment facility. In June 1972, legislation was passed which required industries to establish flow monitoring and sampling stations within one year. When some industries did not comply, the city monitored their discharges and billed the companies for water usage accordingly. The waste water treatment plant demonstrates erratic flow behavior due to changes in industial processes. Average peak-month BOD loads have exceeded 10,000 lb/day. Peak-day influent BOD loads regularly exceeded 10,000 lb/day and were observed to be as high as 19,114 lb/day. Flow equalization, which improves flexibiltiy, is achieved by regulating the amount of sewage pumped through the treatment plant and surcharging the influent trunk sewer. Food processing industries are assessed a surcharge of $0.1231/lb of contributed BOD and $0.0568/100 gal of process waste. (Baker-FRC)

IMPROVED METHOD GENERATES MORE CHLORINE DIOXIDE,
Penwalt Corp., Belleville, NJ. Wallace and Tiernan Div.
R. W. Jordon, A. J. Kosinski, and R. J. Baker.
Water and Sewage Works, Vol 127, No 10, p 44-45, October, 1980. 5 Fig, 9 Ref.

Descriptors: *Chlorination, *Water treatment, *Laboratory test, *Chemical reactions, Chlorine, Disinfection, Odor, Volumetric analysis, Spectrophotometry, Costs, Hydrogen ion concentration, Acidity.

The use of hydrochloric acid in the generation of chlorine dioxide as an alternative to chlorine for water disinfection is discussed. Chlorine dioxide is generated from sodium chlorite and chlorine. Tests have established that in small cost-effective doses (0.1 mole H(+) (HCl) per mole sodium chloride), hydrochloric acid produces a yield greater than 90% using no excess chlorine. Unreacted chlorine and unreacted sodium chlorite in the product stream are reduced, improving both yield and purity. With hydrochloric acid, the generating apparatus requires accurate metering, interlocks to prevent the combination of strong chemical solutions, and special consideration for backpressure at the point of application of the chlorinator injector. Laboratory tests were performed using three methods to check the experimental yields of chlorine dioxide. Titration and spectrophotometry produced good agreement at 360 nm. Purity could not be tested because chlorine and chlorite are mutual interferences in spectrophotometric analyses. Good agreement was also obtained at 260 nm between titration and operation of the apparatus without the chlorinator. Hydrochloric acid is in limited use in Europe and provides more economy for extensive use in taste-and-odor control and the oxidation of manganese. (Titus-FRC)

DESIGN OF BIOLOGICAL FILTRATION PLANTS,
Water Research Centre, Stevenage (England).
G. Hoyland, and N. J. Harwood.
Water Pollution Control, Vol 79, No 3, p 352-269, 1980. 12 Fig, 1 Tab, 19 Ref.

Descriptors: *Mathematical models, *Design, *Trickling filters, *Sewage treatment, *Biological treatment, Suspended solids, Biochemical oxygen demand, Optimization, Economics, Costs, Filtration, Capital costs, Operating costs, Settling basins.

Mathematical models were devised to optimize the capacities of primary sedimentation and biologcial filtration to minimize the overall cost of treatment. Optimization was carried out for two hypothetical works with single biological filtration serving populations. of 10,000 and 100,000, the average daily flow of sewage per person being 200 liters. Derivations are described in detail. The total costs of biological filtration works treating sewage to a 25 mg/liter suspended solids/15 mg/liter BOD standard were minimized to determine optimum design. Optimization was based on capital and operating costs and on performance relations derived from primary sedimentation and secondary treatment. The empirical performance relationships for primary sedimentation predict the average composition of settled sewage for overflow rates of 0.5-6.0 m/hr and influent suspended solids concentrations of 200-1,000 mg/liter. A comparison of total annual costs of filters with equal interfacial area showed that a small random plastic medium having an effective surface area of 200 sq. m/cu m may be more economical than a stone medium having an area of 100 sq m/cu m. The optimization suggested that the total cost of treatment was minimized at works where the retention period in primary sedimentation tanks was low, especially at the works where sludge-treatment costs were high. Discussions follow this paper.(McKeon-FRC)

CHARACTERIZATION AND ACTIVATED CARBON ADSORPTION OF SEVERAL HUMIC SUBSTANCES,
Illinois Univ., Urbana-Champaign. Dept of Civil Engineering.
J. J. McCreary, and V. L. Snoeyink.
Water Research, Vol 14, No 2, p 151-160, February, 1980. 9 Fig, 5 Tab, 20 Ref.

Descriptors: *Humic acids, *Fulvic acids, *Activated carbon, *Adsorption, Chlorination, Water treatment, Organic compounds, Water purification, Laboratory tests, Physical properties, Separation techniques, Hydrogen ion concentration, Phosphates, Molecular structure, Organic acids, Soil physical properties.

The formation of trihalomethanes (THM) during chlorination in water treatment processes has been linked to humic acid in the water supply. Removal of THM may be accomplished after the chlorination step, or these compounds may be reduced by removal of THM precursors prior to the addition

of chlorine. The removal of humic substances by activated carbon was examined using commercially supplied humic acid, extracts of a Michigan Finch soil, and extracts of leaves from a local hardwood forest. The materials were characterized by molecular size fractionation, analysis of functional groups, and haloform formation potential. Haloform formation potential was found to be dependent upon material source. No correlations were found between the amounts of oxygen-containing functional groups and the potentials for haloform formation. Seven-day adsorption tests on a bituminous-base activated carbon revealed a source-dependent relationship for removal of humic substances. Adsorption of humic materials from different sources was inversely related to the number of carboxyl groups per unit weight of the substrate. Humic or fulvic acid species of lower molecular weights were more readily adsorbed, presumably due to greater surface areas. Soil fulvic acid adsorption increased with decreases in pH of the solution and increases in phosphate buffer levels. It was recommended that treatment performance for removal of humic substances from water be evaluated prior to treatment, especially when humic materials from different sources are present. THE EFFECT OF SAN FRANCISCO'S WASTEWATER PLAN ON WATER QUALITY AND AQUATIC BIOLOGY,
California Univ., Los Angeles.
C. T. Hunsaker.
PhD dissertation, 1980. 192 p, 17 Fig, 20 Tab, 55 Ref, 3 Append.

Descriptors: *Waste water disposal, *California, *Sewage, *Water law, *Sewage bacteria, Aquatic populations, Bays, Coliforms, Pathogenic bacteria, Overflow, Assesments, Swimming, Fishing, Shellfish, Environmental Impact Reports, Waste water management, *San Francisco.

The City and County of San Francisco adopted a Wastewater Management Plan in 1980 that uses an ocean discharge system of eight average annual overflows, The conclusion is drawn that while any of the suggested alternatives would have improved ocean and bay water quality, that which called for just one overflow per year would have been the least adverse to recreatinal users (water contact and shellfishing) of the shoreline and near shore organisms. The five alternatives available were variations of two Master Plans allowing for one, four and eight average annual overflows, through either a deep-water outfall alone or to both the ocean and the bay. The environmental review process for the Master Plan is summarized with reference to water quality and aquatic biology, and describes the probable impact of effluent on bay and ocean shoreline study areas. It was difficult to gather scientific aquatic data for the five proposed alternatives because of a lack of scientific information on heavy metals and other potentially toxic substance concentrations in combined sanitary and stormwater overflow discharges. Federal and state water law, municipal treatment works and the environmental assessment process are described. (Garrison-Omniplan)

OPTIMIZING WATER TREATMENT PLANT OPERATIONS FOR SAVINGS OF WATER, ENERGY, AND CHEMICALS,
North Carolina State Univ. at Raleigh. Dept. of Civil Engineering.
A. C. Chao.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-137945, Price codes: A04 in paper copy, A01 in michrofiche. Report, October 1980. 48 p, 20 Fig, 2 Tab, 37 Ref. OWRT-A-108-NC(2), 14-34-0001-9035.

Descriptors: Alkalinity, Backwash, *Water treatment, *Ferric chloride, *Coagulation, Coagulants, Turbidity, Suspended solids, Hydrogen ion concentration, *Filters, Water conservation, Technology, *Filter backwash, Chemicals.

This study investigates the fesibility of reducing the dosage requirement of ferric chloride for the removal of colloidal particles from waters containing low alkalinity by manipulating the pH control of the coagulation process. When metallic salts such as ferric chloride are used as coagulants, the solution pH should be maintained at a certain optimum level to allow the formation of hydroxo-polymers or hydroxide precipitates from the added coagulants. Since the chemical reactions result in reducing the solution pH, bases are simultaneously added to maintain a constant pH at the optimum level. This constant pH method has been practiced for laboratory coagulation studies and in water treatment. The results of laboratory studies indicate that a two-step pH control method can achieve the same removal efficiency as the constant pH method but at lower dosage requirements. The study also investigates the feasiblity of reducing the consumption of treated water for filter backwash. The current backwash practice employs a constant backwash rate of 18-25 gpm/ft sup 2 (50% bed expansion) for 5 - 15 minutes to clean a clogged filter. A new method employs an initial low backwash rate which causes only 10-15% bed expansion. At this bed expansion the sand grains are more efficiently scoured and cleaned than at the higher level for an effective rinsing of the filter bed. Laboratory studies indicate that the new backwash method is as effective as the constant rate method. Because of the low initial rates employed, the new method results in a saving of 30% water consumption. (Kiger-NC)

APPARATUS FOR EMERGENCY WATER PURIFICATION,
E. H. Pavia.
U.S. Patent No 4,196,081, 6 p, 6 Fig, 8 Ref; Official Gazette of the United States Patent Office, Vol 993, No 1, p 244, April 1, 1980.

Descriptors: *Patents, *Water treatment, *Water purification, Filtration, Water quality control, Filters, Equipment, Potable water, Emergencies, Sequential filtering.

A method and apparatus for the purification of water in emergency situations is provided, comprising a manually operated pump having a discharge port connected to a number of series-connected treatment filters. Each filter is chosen for its ability to perform a desired purification function in a preferred sequence which enhances the performance of the subsequent filter in the series. The filters are designed to accept water from a contaminated source, thereafter removing particulate matter, and inorganic impurities and inorganic impurities, and finally physically filtering out bacteria and other organisms larger than 0.20 microns in size to deliver potable water from the outlet port of the final filter. Preferably, all components are mounted in a suitable portable enclosure for ease of storing and for transporting the unit to a water source in an emergency situation. (Sinha - OEIS)

HOW VANCOUVER KEEPS ON TOP OF SEWER MAINTENANCE,
Superintendent of City Sewers, Vancouver (British Columbia).
T. Baker.
Water and Pollution Control, Vol 18, No 9, p 22, 24, 37, 43, September, 1980.

Descriptors: Domestic wastes.

Methods currently being used in sewer maintenance in Vancouver, British Columbia are reported by the city's Superintendent of Sewers. Closed-circuit television cameras are used in assessing the condition of sewers. Since 1965, a self-contained, truck-mounted flushing unit using high-pressure water has proved an effective and inexpensive unstopping method. A rodding machine has been used regularly since 1966 to clear sewers of tree roots. The herbicide Sanafoam Vaporooter has also been effective in treating root problems. Sewers have been relined using 12-24 inch PVC piping. A new English product, Insituform, has been used to reline pipes: a resin-impregnated felt bag is cut to measure, installed with cold water pressure, after which the water is heated to cure the resin. Spills of flammable liquids should be contained at the street level and removed or neutralized there. When there is an excess storm water problem, a portable smoke generator and blowers are used to check for possible connections between sanitary and storm sewers (if there is no connection, the smoke will blow out of house stacks; if there is a connection, it will blow out of the down spouts). Equipment used in unstops of property-to-municipal sewer hookups is also discussed. Repair of sewer breaks with rubber couplers is recommended. The records and map system used by the municipal department is also described. (Just-FRC)

ENDOTOXINS, ALGAE AND LIMULUS AMOEBOCYTE LYSATE TEST IN DRINKING WATER,
Pittsburgh Univ., PA. Graduate School of Public Health.
J. L. Sykora, G. Keleti, R. Roche, D. R. Volk, and G. P. Kay.
Water Research, Vol 14, No 7, p 829-839, July, 1980. 4 Fig, 5 Tab, 20 Ref.

Descriptors: *Potable water, *Chlorophyta, *Bacteria, *Limulus amoebocyte lysate test, Water quality, Algae, Endotoxins, Analytical techniques, Bioassay, Public health, Regression analysis, Water supply, Pennsylvania, Pittsburgh(PA).

Five water systems in Allegheny county (Pittsburgh, PA) were selected to determine the relationship between various organisms in drinking water and the Limulus amoebocyte lysate (LAL) gelation titer. Non-specific reactions of the LAL assay were also analyzed. The greatest total lipopolysaccharide (endotoxins) levels as measured by the LAL assay were found in the reservoirs with high concentrations of algae and Standard Plate Count bacteria. Uncovered finished water basins were found to have the highest concentrations of phytoplankton. The major source of the 'endotoxic' response was a non-specific reaction caused by algae. Chlorella vulgaris (Chlorophyta) was the most common alga. The LAL test on samples grown in the laboratory verified the phenomenon observed on field samples and indicated a non-specific reaction. Cultures of Schizothrix calcicola, the most dominant Cyanobacterium found in the five water systems, grown under identical conditions produced a specific response. Alkali and lysozyme treatments were capable of distinguishing specific and non-specific LAL reactions. These two techniques and the LAL gelation test are recommended for the assessment of drinking water quality. (McKeon-FRC)

MANAGEMENT OF THE HYDROLOGIC SYSTEM IN AREAS SUBJECT TO COAL MINING ACTIVITIES,
Utah Water Research Lab., Logan.
R. H. Hotchkiss, E. K. Israelsen, and J. P. Riley.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-127383, Price codes: A05 in paper copy, A01 in microfiche. UWRL Water Resources Planning Series P-80/05, October 1980. 84 p, 32 Fig, 16 Tab, 3 Append. OWRT A-046-UTAH(1), 14-34-0001-9047.

Descriptors: *Coal mines, *Multiple-purpose projects, *Water management(Applied), *Land management, Groundwater, Water supply, Water storage, Pumping, Water quality control, Inflow, Colorado River.

The report examines the effects of present mining activities on the associated hydrologic system, and identifies specific mining procedures and management techniques which not only minimize negative hydrologic impacts of mining operations, but which also enhance the value of the hydrologic

system in terms of existing and potential social uses. Thus, the results of the research contribute to the solution of present and future hydrologic problems (both quantity and quality) associated with coal mining in the western U.S. Emphasis is placed on sites which are representative of both existing and future coal mining areas. Specific objectives which are addressed and discussed in terms of actual coal mines in central Utah are (1) evaluation of the potential for using underground coal mines to tap previously inaccessible groundwater supplies, reduce the salt load to the Colorado River by decreasing the contact of groundwater with salt-bearing geologic formations, and store water in abandoned mines; (2) consider the potential effects of underground coal mines on water resources; and (3) evaluate the potential of using surface mined areas to collect surface runoff. The study suggests not only ways of reducing negative hydrologic impacts of mining operations, but also operational and management mining techniques which will enhance the social use value of the hydrologic systems, and thus, in fact, create hydrologic opportunities.

PHOSPHORUS MANAGEMENT FOR THE GREAT LAKES.
International Joint Commission-United States and Canada.
Final Report to International Joint Commission's Great Lakes Water Quality Board and Great Lakes Science Advisory Board, July, 1980. 129 p, 6 Fig, 9 Tab, 97 Ref, 2 Append.

Descriptors: *Phosphorus, *Great Lakes, *Planning, *Water quality, *Control systems, Evaluation, Economic impact, Alternate planning, Phosphorus compounds, Phosphates, Bodies of water, Lakes, Limnology, Aquatic environment, Water quality control, Assessment, Economics, Mathematical models, Model studies, Models, Social impact, Canada.

This report has presented the findings of the Phosphorus Management Strategies Task Force, appointed in the Spring of 1978 by the Great Lakes Science (Research) Advisory Board to investigate alternative strategies for the management of phosphorus inputs to the Great Lakes. Subsequently, the Task Force was expanded to also include interaction to the Water Quality Board of the International Joint Commission. The overall report has considered: the development of the 1978 Great Lakes Water Quality Agreement phosphorus target loads; evaluation of phosphorus inputs in the Great Lakes; review and evaluation of mathematical models for predicting limnological effects of changes in phosphorus loadings and the validity of target loads; costs and technologies of phosphorus control; social/economic impact assessment strategies; and phosphorus management strategy. The next major decision point in the Great Lakes phosphorus management program is anticipated in about five years. Twelve Task Force recommendations were determined for the immediate phase of a phosphorus management strategy. (Zielinski-IPA)

OIL-COLLECTING SHIP FOR OIL SPILLS,
Mitsui Shipbuilding and Engineering Co. Ltd., Tokyo (Japan).
H. Muneta.
U.S. Patent No 4,191,650, 5 p, 4 Fig, 4 Ref: Official Gazette of the United States Patent Office, Vol 992, No 1, p 248-249, March 4, 1980.

Descriptors: *Patents, *Oil spills, *Oil pollution, Water quality control, Skimming, Ships, Equipment, Collection.

A ship for collecting oil from oil spills floating on the surface of the sea comprises a pair of side hulls forming between them a flow passage through which a stream of oil-laden water will flow when the ship travels through the the floating oil. Between the side hulls, a center hull is provided in which a well is formed having a bottom which opens into the flow passage and through which the oil in the passage may float upwardly to be trapped in the well. A pump is provided to pump the trapped oil from the well. The bottom of the well is below the surface of the sea and the stream is deflected under the bottom by a forwardly-inclined segment extending between the side hulls. A splash plate is provided to overlie the upper end of the segment to direct the upward splashes from the segment over the top edge of the segment into a splash chamber behind the segment. The water and/or oil collected in the splash chamber may flow into the well through a connecting opening. (Sinha - OEIS)
W81-00521

APPARATUS FOR FILTER BACKWASHING,
Envirotech Corp., Menlo Park, CA. (Assignee).
E. A. Whitmore.
U.S. Patent No 4,191,652, 7 p, 4 Fig, 5 Ref; Official Gazette of the United States Patent Office, Vol 992, No 1, p 249, March 4, 1980.

Descriptors: *Patents, *Water treatment, *Water quality control, Filtration, Filters, Industrial water, Suspended solids, Equipment, Backwashing.

Water often contains particulate material which must be removed before it can be used. Many industrial processes require water which has only minimal quantities of particulate mater. One conventional method for removing particulate material from water is to pass the water downwardly through a bed of filter media comprising sand or some other granular material. As the process is carried out particulate material accumulates in the bed thus resulting in a loss of hydraulic head across the bed. After a substantial quantity of particles builds up in the bed the head loss becomes so great that it is necessary to stop the filtering process and remove the deposited particles. An object of this invention is to provide a filter with an air backwashing device having three cushions of air. Laterals with nozzles are placed below the filter media to convey backwashing air and water into the filter bed. Below the laterals are located a manifold and a distribution plenum to carry air into the laterals. The manifold and distribution plenum are separated by a common wall having ports. (Sinha - OEIS)
W81-00522

TREATMENT OF AQUEOUS SYSTEMS,
CIBA-GEIGY Corp., Ardsley, NY. (Assignee).
D. R. Clark, A. Marshall, and M. A. Finan.
U.S. Patent No 4,192,744, 7 p, 3 Fig, 3 Tab, 13 Ref; Official Gazette of the United States Patent Office, Vol 992, No 2, p 627, March 11, 1980.

Descriptors: *Patents, *Water treatment, *Water quality control, Demineralization, Scaling, Separation techniques, Alkali metals, Flocculation.

The invention provides a method of treating an aqueous system to selectively flocculate compounds of iron ions. A minor proportion of a compound is added in the presence of calcium ions to inhibit the formation of adherent aklaline scales. The compound may be used singly or in a mixture in an aqueous system to be treated in conjuction with other compounds known to be useful in water treatment. (Sinha - OEIS)
W81-00523

ION EXCHANGE METHOD AND APPARATUS,
Chromalloy American Corp., City of Industry, CA. (Assignee).
P. S. Meyers.
U.S. Patent No 4,193,868, 5 p, 2 Fig, 7 Ref; Official Gazette of the United States Patent Office, Vol 992, No 3, p 1003, March 18, 1980.

Descriptors: *Patents, *Water treatment, *Ion exchange, Water quality control, Separation techniques, Equipment, Flow control, Regeneration.

This invention provides an ion exchange apparatus constructed so as to utilize a single set or group of manifolds and channels for both service and regenerant flow but which is also constructed to handle comparatively large quantities of water at a comparatively low pressure during service use and to handle and distribute lesser quantities of regenerant solution at a higher pressure during regeneration of the ion exchange bed. Operation can be improved by using a check valve permitting flow in one direction to all of the channels as the bed is being employed under service conditions to treat water and permitting flow in the opposite direction in less than all of the channels as the bed is being treated with regenerant solution. IN-GROUND PRECIPITATION ENDS WELL-SCREEN PLUGGING,
K. Grover.
American City and County, Vol 95, No 4, p 55-58, April, 1980. 2 Fig.

Descriptors: *Wells, *Iron, *Manganese, *Chemical precipitation, Aquifers, Corrosion, Well casings, Aeration, Filtration, Sands, Costs, Metals, Municipal water, Injection, Hydrogen ion concentration, Oxidation-reduction potential, Gravels, Groundwater.

The first U.S. in-situ system to remove iron and manganese from well water supplies is being installed at Pembroke, Massachusetts. The town well at Pembroke plugged repeatedly in spite of costly cleaning steps and various efforts to sequester the iron. This new method includes an aeration procedure followed by sand filtration, as do other treatment methods. However, the new process, Vyredox, which was developed in Finland, uses the sand and gravel in the well itself as a filter. Conventional systems require chemical addition to cause precipitation, while Vyredox employs natural biochemical precipitation. Redox potential and pH are kept so high that iron and manganese are precipitated and retained in the sand-gravel layers of the aquifer. In a typical installation, a number of aeration wells are placed around a supply well. Water from an outside source is passed through an oxygenator for degassing and oxygen enrichment. This water is then injected into the aquifer. Since underground filtration is slower, it is assumed to be more efficient than above-ground filtration in removing iron and manganese. The process is suited to shallow sand-gravel aquifers. One disadvantage is the cost of determining whether the process will be successful at a given location. Pilot tests can cost about $40,000, $15,000 of which is for finished injection wells that will be used in the final installation. (Baker-FRC)
W81-00588

CROSS-CONNECTION CONTROL MEANS POTABLE WATER SAFETY.
American City and County, Vol 95, No 1, p 61-62, January, 1980. 1 Tab.

Descriptors: *Potable water, *Diseases, *Municipal water, *Water distribution(Applied), Water quality, Water pollution sources, Water pollution effects, Public health, Water pollution control, Sewerage, Distribution systems, Human diseases, Local governments, Legislation, Odor.

Various wasy to achieve cross-connection control for potable water supplies are considered. Cross-connections can occur whenever a potable system is connected to a non-potable supply operating at a higher pressure. The negative pressure or reduced pressure in the line causes backsiphonage. It is estimated that 90% of consumer complaints about

bad odors in the water in Cleveland can be traced to cross-connection problems. Of 3,926 cases of water borne disease caused by contamination through the distribution system and reported to the National Center for Disease Control between 1946 and 1970, 1,752 were attributed to cross-connections, and 785 were caused by backsiphonage. One method of achieving control requires the customer to install an approved backflow prevention device at each service connection. Other criteria necessary to establish a cross-connection control program include the designation of a single authority in charge of the program, understanding of state law and development of local ordinances, familiarity with various approved control devices, knowledge of installation procedures, periodic maintenance and testing, thorough record keeping, and organization of an effective public information program. Schemes which have been devised for this problem in Henrico County, Virginia and in Cleveland are briefly reviewed. (Baker-FRC)

METHODS FOR THE ISOLATION OF VIRUS FROM RAW AND DIGESTED WASTEWATER SLUDGE,
Royal Veterinary and Agricultural Univ., Copenhagen (Denmark). Dept. of Veterinary Virology and Immunology.
A. L. Nielsen, and B. Lydholm.
Water Research, Vol 14, No 2, p 175-178, February, 1980. 3 Tab, 14 Ref.

Descriptors: *Viruses, *Sewage sludge, *Sludge disposal, *Pollutant identification, *Tertiary treatment, Fertilizers, Soil contamination, Toxins, Environmental sanitation, Laboratory tests, Analytical techniques, Isolation, Separation techniques, Waste disposal, Waste water treatment, Adsorption, Temperature, Hydrogen ion concentration, Disinfection.

Increased interests in the use of sludge as fertilizer for land application has raised problems of the treatment of sludge for removal of viruses. Virus removal from sludge has been complicated by the lack of detection methods for viruses in sludge. Studies measuring the viral content of sludges that have been directly inoculated fail to account for the differences that may exist between indigenous viruses incorporated into sludge and artificially intruduced viruses that are absorbed onto the surfaces of particles. In the present study, four different quantitative techniques for the detection of viruses in waste-water sludges were tested on raw and digested sludge. Satisfactory results were obtained with acidic precipitation followed by elution with beef extract and alum precipitation followed by elution with tris buffer. Good recovery was also obtained with elution with beef extract even on sludge with high levels of total suspended solids. Direct inoculation of sludge into cell cultures was unfeasible due to the harmful effects of other sludge constitutents to cells. Viruses were found in all raw sludge samples and at a higher concentration than in digested sludge specimens. Some of the viral types identified were coxsackievirus B2 and B5, poliovirus 1, 2, and 3, and adenovirus 1 and 2. In one sample, adenovirus type 2 was detected one day after sludge application to land and in another sample, coxsackievirus B5 was identified 4 months after sludge application to land. (Geiger-FRC)

REDUCTIONS IN INACTIVATION RATES OF BACERIOPHAGES BY CLAY MINERALS IN LAKE WATER,
New York Univ., NY. Lab. of Microbial Ecology.
H. Babich, and G. Stotzky.
Water Research, Vol 14, No 2, p 185-187, February, 1980. 3 Fig, 24 Ref.

Descriptors: *Viruses, *Adsorption, *Clay minerals, *Lakes, *Pathogenic bacteria, Suspended solids, Suspension, Filtration, Disinfection, Bacteriophage, Path of pollutants, Water pollution sources, Enteric bacteria, Heat treatment, Humic acids, E. coli, Water quality control.

The effect of clay minerals on the survival of bacteriophages of Eschrichia coli and Staphylococcus aureus were studied in natural water samples from the freshwater Lake Kauneonga. Clay preparations of kaolinite, montmorillonite, vermicullite, or attapulgite clays were added at different concentrations to test tubes of lake water inoculated with two phages of E. coli and three of S. aureus. The test tubes were serially diluted with buffer and applied to appropriate host bacterial cultures on agal plates. Plaques were counted after 18 hr of incubation. Results showed variations in the stabilities of bacteriophages in natural lake water. The rate of inactivation of an S. aureus phage was found to be greatly reduced in the presence of clay minerals in either filtered or autoclaved or unautoclaved lake water with the sequence of protection being attapulgite>vermiculite>montmorillonite, kaolinite. The viral protection afforded by the clays was attributed to the adsorption of the viruses onto the clay particles in the lake water suspensions. Lake of protection of viruses by the addition of humic acids or heat-killed microbial cells in other experiments could have been due to the inability of these materials to successfully adsorb the viruses. (Geiger-FRC)

DEVELOPMENT OF CHLORINE RESISTANT MEMBRANE, ASYMMETRIC POLYIMIDE MEMBRANE AND POROUS SUBSTRATES,
Membrane Systems, Inc., San Diego, CA.
R. G. Sudak, J. M. Chirrick, R. L. Fox, M. E. McKee, and J. B. Bott.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-142242, Price codes: A11 in paper copy, A01 in microfiche. Final Report to Office of Water Research and Technology, September, 1980. 234 p, 62 Fig, 92 Tab. OWRT-C-90176-D(No 9515)(1), 14-34-0001-9515.

Descriptors: *Membranes, *Research and Development, *Filtration, *Reverse osmosis, *Polymers, Permeability, Permselective membranes, Porous media, Films, Waste water treatment, Water pollution treatment, Water quality, Water qualtiy control, Pores, Plastics, Chlorination, Stability, Heat resistance, Membrane processes, Separation techniques, Semipermeable membranes, Synthesis, Water treatment.

This study was divided into three concurrent projects for development of (1) porous substrates for composite membranes, (2) chlorine-resistant membranes, and (3) asymetric polyimide membranes. Under (1) development of supports with different polymeric materials (other than polysulfone) was undertaken to increase: (a) the number of possible solvents for use in membrane barrier layer formation; and (b) the allowable temperatures for such formation. These new materials were developed with pore size variations for use in ultrafiltration/microfiltration applications as well as hyperfiltration. For polyimide porous supports, asymmetric membrances could be cast with a degree of permselectivity, undertaken to improve polyimide membrane reverse osmosis characteristics. Cellulose acetate is stable to low residual chlorine concentrations in feedwaters, but polyimide in sheet composite membrane or asymetric hollow fine fibers were not. Instability was attributed to secondary amines in the membrane barrier layer polymer. The mechanism of residual chlorine degradation of various polymers was investigated, which led to synthesis of several polymers and their subsequent reaction to form polyimide membrane layers. STATUS REPORT ON ABATEMENT OF WATER POLLUTION FROM THE CANADIAN PULP AND PAPER INDUSTRY (1978).
Environmental Protection Service, Ottawa (Ontario). Water Pollution Control Directorate.
Report No EPS 3-WP-80-4E, May 1980. 23 p, 2 Fig, 10 Tab, 2 Append.

Descriptors: *Water pollution sources, *Pollution abatement, *Pulp wastes, Industrial wastes, *Canada, *Pulp and paper industry, Pulp wastes, Wastes, Water pollution, Sulfite liquors, Wood wastes, Paper industry, Lumbering, Abatement, Control, Water pollution control, Biochemical oxygen demand, Suspended solids, Fish toxins, Mills, Pollutants.

Canadian pulp and paper effluent regulations limiting the discharge of suspended solids, biochemical oxygen-demanding substances, and toxic materials were promulgated under Federal Fisheries Act in November, 1971. This report, presented in English and French, gave an assessment of progress made to 1978 in meeting discharge objectives, and projected future developments through to 1986. This assessment was a result of a review of individual mill operations and written complianace programs, and was developed through Environmental Protection Service regional personnel and provincial environmental agencies cooperation. Effluent discharges from the pulp and paper industry are presented in terms of total suspended solids (TSS), biochemical oxygen demand (B0D-5), and wastes toxic to fish. While pulp and paper production increased about 5% between 1976 and 1978, TSS discharges were reduced by about 14% and BOD-5 decreased by about 5%. TSS discharges decreased for all regions except the Pacific region, which remained stable; B0D-5 discharges were lower in all regions except Quebec, which remained the same as 1976. Mills in compliance for TSS and B0D-5 increased over the 1975/76 to 1978 period by 13 and 8, respectively. Fifty-four mills test toxicity of effluents to fish, but a large number of mills do not. (Zielinski-IPA)

METHOD AND DEVICE FOR REMOVING SOLID AND/OR LIQUID MEANS CONTAINING HARMFUL SUBSTANCES,
E. Crema.
U.S. Patent No 4,194,978, 11 p, 7 Fig, 2 Ref; Official Gazette of the United States Patent Office, Vol 992, No 4, p 1382, March 25, 1980.

Descriptors: *Patents, *Waste water treatment, *Water pollution treatment, Water quality control, Water reuse, Equipment, *Waste spills, Suction, Water jet pumps.

A method and apparatus for removing solid and/or liquid matter containing harmful substances from the ground or from the surface of water is described. A vacuum up to 0.1 bar is generated by a water jet pump, whereby the matter can be sucked up even over differences in height of almost 10 meters. The water jet pump is arranged in a closed water circulation system which uses a centrifugal pump for its drive, preferably a fire-extinguishing pump. In order to prevent the harmful substances from getting into the water circulation, a collecting vessel is arranged in the suction line for the harmful substances. (Sinha - OEIS)
W81-00713

PLEATED FILTER UNDERDRAIN, METHOD AND APPARATUS,
Harsco Corp., Wormleysburg, Pa. (Assignee).
T. D. Ward.
U.S. Patent No 4,196,079, 8 p, 8 Fig, 9 ref; Official Gazette of the United States Patent Office, Vol 993, No 1, p 243, April 1, 1980.

Descriptors: *Patents, *Water pollution treatment, *Filtration, Water purification, Filters, Waste water treatment, Equipment, Air circulation, Backwashing.

Filter beds for use in moving suspended solids from water supplies to meet present day requirments for potable water and waste effluent quality generally use a layer filter bed generally comprised of a graded sand and gravel media having gravel at the lowermost position, and the sand, anthracite coal and other fine media layered on top. A method and apparatus is described for air scouring a layered filter bed when air is dispersed into the finer particles of the bed without disturbing the coarse large aggregate in the lower portion of the bed to prevent inter-mixing of the fine aggregate with the large aggregate. The filter underdrain comprises a corrugated support structure forming peaks and valleys. The larger granular filter media

is placed in the lower portion of the valleys. The peaks of the filter support form air channels through which pressurized air is dispensed during the cleaning cycle to air scour the sand. Drainage apertures are formed in the lower portion in the gravel through which the filtered water flows into the lower portion of the channels and into storage facilities. (Sinha - OEIS)

FLOATING, SURFACE LIQUIDS RETRIEVAL SYSTEM,
E. T. Gordon.
U.S. Patent No 4,196,087, 12 p, 13 Fig, 12 Ref; Official Gazette of the United States Patent Office, Vol 993, No 1, p 246, April 1, 1980.

Descriptors: *Patents, *Oil spills, *Oil pollution, Water pollution treatment, Water quality control, Equipment, Floating, Separation techniques, Vacuum suction, Floating boom.

A floating retriever for retrieving spilled oil or other liquid substances on the top of water has a central liquid collection chamber with a vacuum or suction pick-up for delivery of the pollutants to a mother vessel. The Vessel controls the retriever by means of a boom structure. The retriever has a large surrounding circular float with intake ports with 'V' shaped lateral screws to bring the retrieved liquid to the collection chamber. The device includes an inverted-dome water well with limited openings underneath the collection chamber for stability, as well as radially positioned, selectively controlled, out-rigged screws including an auxiliary tow, for drawing the oil to the intake ports and providing for propulsion and guidance. The ports have inclined stepped bottom surfaces with discharge holes with a lower paddle wheel drive to initially enhance oil/water separation, as well as jets or sprays for producing a suction effect in the intakes. (Sinha - OEIS)

MULTIOBJECTIVE ANALYSIS IN THE MAUMEE RIVER BASIN: A CASE STUDY,
Case Western Reserve Univ., Cleveland, OH. Systems Engineering Div.
Y. Y. Haimes, P. Das, and K. Sung.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-127524, Price codes: A11 in paper copy, A01 in microfiche. Completion Report submitted to the National Science Foundation and the Office of Water Research and Technology, October, 1979. 226 p, 12 Fig, 18 Tab, 71 Ref, 2 Append. OWRT-C-7047(No 6221)(6), 14-34-0001-6221.

Descriptors: *River basins, *Planning, *Mathematical models, *River basin development, Mathematical studies, Model studies, *Decision making, Data collections, Probability, Basins, Watershed management, Watersheds(Basins), Rivers, Bodies of water, Water resources planning, Comprehensive planning, Estimating equations, Statistical models, Input-output analysis, Optimization, Ohio, *Maumee River basin.

Systematic evaluation and identification of critical existing/future water/land resources problems in the Maumee River Basin was undertaken to consider formulation of a planning/management framework as a sound decision-making tool for the Basin. Planning was carried out with Maumee River Basin Level-B Planning Board cooperation, and the study results were used in Level-B planning and in formulating a recommended plan for the Basin. The study was divided into two phases. Phase I covered mathematical models development; integrating and testing the models with the available data base to determine their use as planning tools; and implementation of the Surrogate Worth Trade-off (SWT) method. Phase II covered analysis of Phase I results, improving the developed mathematical models, and evaluating the success of the SWT method; incorporating multiobjective water/land resources analysis into broader environmental/economic objectives; extending the hierarchical multiobjective structure and solution techniques; and documenting the overall experiences. Using SWT, decision-maker preferences and used only in the final analysis stages where surrogate worth functions are evaluated at specific points in the function space to determine the preferred solution. BASIN DEVELOPMENT AND WATER ALLOCATION,
Nevada Univ. System, Reno. Desert Research Inst.
J. W. Fordham, G. F. Cochran, H. N. Friesen, W. W. Pidcoe, and S. A. Bamberg.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-127276, Price codes: A04 in paper copy, A01 in microfiche. Publication No 41065, 1980. 53 p, 19 Fig, 9 Tab, 14 Ref, Append. OWRT-B-038-NEV(4) and B-050-NEV(2), 14-31-0001-3104, 14-31-0001-3612.

Descriptors: *Model studies, *Water resources development, *Nevada, *Semiarid climates, *Water rights, Mathematical models, Water law, Simulation analysis, Precipitation(Atmospheric), Snowmelt, Groundwater movement, Subsurface flow, Surface-groundwater relationships, Watersheds(Basins), *Great Basin.

Simulation techniques are described which would aid in the allocation of ground and surface water in semi-arid basins. The study area was Hualapai Valley in the northwestern Great Basin about 115 miles north of Reno, Nevada. The study was undertaken to simulate the combined surface and subsurface hydrology of a desert basin undergoing development and to determine the effects of the application of water right law on the hydrologic system. The utilization of the simulation models developed in conjunction with computerized water right information can provide the basis for approval or rejection of applications to appropriate water and criteria for allocation of water to users during periods of deficient supply.

INVOLVING THE PUBLIC IN WATER AND POWER RESOURCES DECISIONS,
Creighton and Creighton, Saratoga, CA.
J. L. Creighton.
Available from Supt. of Documents, GPO, Washington, DC 20402. Water and Power Resources Service Report, June 1980. 340 p, 21 Fig, 39 Ref, 2 Append. 8-07-83-V0709.

Descriptors: *Planning, *Water resources, Evaluation, Social aspects, Social participation, Decision making, Methodology, Public involvement.

This manual presents standards, instructions, and techniques for planning, implementing, and reporting public involvement programs. It is applicable to public involvement in the planning of large and small scale projects and progams that will significantly affect the public, and is specifically applicable to public involvement in water resources planning. The manual presents: the rationale and general principles for public involvement; guidelines and techniques for determining the need for public involvement, identifying the affected groups, and designing a public involvement program; organizational issues involved in administering and coordinating public involvement programs; techniques for designing and running public meetings, and methods other than public meetings for involving the public in the planning process. An appendix provides examples of printed materials for communication with the public, such as newsletters, public announcements, brochures and booklets. (Moore - SRC)

TEXAS LIGNITE: ENVIRONMENTAL PLANNING OPPORTUNITIES,
Fish and Wildlife Service, Fort Worth, TX.
T. J. Cloud, Jr.
Available from Supt. of Documents, GPO, Washington, DC 20402. Report FWS/OBS-78/26, June 1978. 19 p, 1 Fig, 1 Tab, 32 Ref.

Descriptors: *Strip mines, *Lignite, *Environmental effects, *Plannning, Texas, Land reclamation, Social aspects, Recreation, Wildlife, Vegetation, Coal mines, Public involvement.

To date, the adverse effects of lignite surface mining in Texas have been limited due to the small number of mining operations in existence. However, to meet future energy demands large areas of east and southcentral Texas will be strip mined for lignite. Aquatic, terrestrial, and recreational environmental impacts which will potentially be assoicated with lignite strip mining are discussed. Opportunities for proper environmental protection measures are proposed, including involving concerned agencies and the public in planning, the establishment of reclamation plans, and the development of information regarding the environmental requirements of plant and animal species. WATER REQUIREMENTS AND COSTS FOR SOUTH DAKOTA RURAL MANUFACTURING FIRMS,
South Dakota State Univ., Brookings. Dept. of Economics.
R. Hoffman, and T. L. Dobbs.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-131088, Price codes: A06 in paper copy, A01 in microfiche. Research Project Technical Completion Report, 1980. 108 p, 32 Tab, 19 Ref, 3 Append. OWRT A-071-SDAK(1), 14-34-0001-9044.

Descriptors: *Water requirements, *Water supply, *South Dakota, *Rural areas, *Industrial plants, *Cost analysis, Costs, Econometrics, Community development, Factories, Water use, Water distribution(Applied), Feasibility, Cost-benefit analysis, Instrumentation, Evaluation, Statistical methods, Statistics, Data collections, Economic feasiblity, Economic impact.

A mail survey of manufacturing firms, a personal survey of a subsample of manufacturing firms, and a personal survey of certain municipal offices pro-

vided the data for this study. Cross-tabulation was used to evaluate relationships among variables, covering firm type, water volume use, town size, water supply source, employment, special water supply considerations in firm location, water problems, and water-related facilities used by firms. Analysis of variance and regression tested for differences in water volume use among firm types, firm employment levels, and firms in varying town sizes. A budgeting procedure was used to estimate possible costs due to municipal water system expansion to accommodate a new firm. Firms of Instruments and Food manufacturing classifications averaged the highest water level use in 1978; while Lumber Products and Transportation firm classifications were among the lowest 1978 water consumers. Annual water use increased with firm employment size. Firms having production, heating, or cooling as their major water use used more water annually than firms using water principally for drinking and sanitation. Estimates of water use by industry type can be used by planners for water system expansion needs to accomodate new industry. (Zielinski-IPA)

STRATEGY FOR ASSESSING IMPACTS OF POWER PLANTS ON FISH AND SHELLFISH POPULATIONS,
National Power Plant Team, Ann Arbor, MI.
E. S. Fritz, P. J. Rago, and I. P. Murarka.
Available from Supt. of Documents, GPO, Washington, DC 20402. Report FWS/OBS-80/34, July 1980. 80 p, 18 Fig, 87 Ref.

Descriptors: *Powerplants, *Environmental effects, *Shellfish, *Fish, Planning, Statistical models, Environmental impact.

The shortcomings of existing guidance documents and environmental impact assessments for power plants indicate the need for a strategy or plan which can enhance the efficiency of data collection and the reliability of conclusions. A strategy was designed for use by biologists responsible for conducting or reviewing assessments of impacts on fish and shellfish. The strategy consists of six steps: conceptualization of the ecosystem to be assessed; design and execution of needed pilot investigations; refinement of conceptualization; design of a study plan; execution of the study plan; and evaulation of impact. An interdisciplinary group consisting of a fisheries biologist, a physiologist and behaviorist, a biostatistician, a population dynamicist, a systems ecologist, and a design engineer is assembled to conduct the assessment. The strategy is the procedure for assessing the effects of a generalized electric generating facility site in an area where the impact on fish and shellfish is high. However, it can be applied to assessments for less sensitively sited facilities, site evaluation studies, assessments for existing facilities, and additions to existing facilities. (Moore - SRC)

OPERATIONAL STUDY FOR PLANNING PURPOSES OF A PUMP-STORAGE RESERVIOR SYSTEM,
California Univ., Los Angeles.
A. Tabatabaee-Diba.
MS thesis, 1980. 59 p, 19 Fig, 4 Tab, 22 Ref, 1 Append. Water Resources Center Archives, University of California, Los Angeles. UCAL-WRC-W-535.

Descriptors: *Pumped storage, *Reservoirs, *Hydroelectric plants, *Simulation analysis, *Planning, Reservoir yield, California, Demand, Pricing, Power marketing, Load distribution, Peak loads, Peak power, Hydrology.

Pump-storage technique is a promising method for production of hydroelectric energy and has become a significant element of the electric power systems of the 1980's. For planning purposes, a parametric search technique was used to study the revenue response of a pump-storage reservoir system to changes in demand and other operational constraints. The results show that the parametric study can be used effectively for project planning and operation of such a system. The Oroville-Thermalito reservoir system in northern California was selected for analysis, using sixty years (1914-1973) of monthly historical stream flows routed through the system in wet and dry weather cycles. Average yearly revenue from the sale of power was considered as the dependent variable. The independent variables were: (1) the requested or contractual power level; (2) the ratio of the total number of minimum on-peak hours to the total number of hours; and (3) the ratio of the value of the off-peak to the on-peak energy output. That the energy demand was treated parametrically suggests that the study is suitable for future planning purposes of the system. (Garrison-Omniplan)

EXPLORATIONS IN MULTIOBJECTIVE WATER RESOURCE HISTORY,
Massachusetts Inst. of Tech., Cambridge, MA. Ralph M. Parsons Lab. for Water Resources and Hydrodynamics.
D. C. Major, R. Ambrose, and R. Coleman.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-133415, Price codes: A05 in paper copy, A01 in microfiche. Technical Report, June, 1977. 87 p, 3 Tab, 76 Ref OWRT-C-5172(No 4206)(1).

Descriptors: *Planning, *Water resources development, *Multiple-purpose projects, *Comprehensive planning, *Research priorities, Project planning, Water resources, Management, Water policy, Civil engineering, River basin development, Reclamation, Federal Government, Legal aspects, Political aspects, Economics, History.

In this exploratory study, several key programs were examined, using specified data sources to study each, to gain a perspective of the role of multiobjectives in the history of water resources planning in this country. Programs selected for study were the reclamation program and the 308 program, as well as a river basin planning effort that developed as a result of the 308 program. It was concluded from the sources studied that both the reclamation program and the 308 programs were multiobjective, but in different ways. The former, studied primarily through analysis of debates in Congress, was multiobjective with respect to regional and social aims (especially when related to the family homestead); while the latter contained multiobjective elements related to lives and safety with respect to monetary measures of national income benefits and costs. Congressional committee and floor debates on 308 projects might reveal a broader multiobjective character than the Corps reports. Three exceptional areas for follow-on studies were suggested by the exploratory study reported here. (Zielinski-IPA)
W81-00674

WATER AS A PARAMETER FOR DEVELOPMENT OF ENERGY RESOURCES IN THE UPPER GREAT PLAINS -- EFFECTS ON LAND AND WATER RESOURCES OF ALTERNATIVE PATTERNS OF COAL-BASED ENERGY DEVELOPMENT,
North Dakota Agricultural Experiment Station, Fargo.
D. F. Scott, G. H. Pfeiffer, and D. E. Gronhovd.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-133670, Price codes: A03 in paper copy, A01 in microfiche. Research Report No 70, December, 1978. 35 p, 7 Fig, 22 Tab, 27 Ref. OWRT-C-7187(No 6217)(1), 14-34-0001-6217.

Descriptors: *Great Plains, *Coal mines, *Cost analysis, *Land reclamation, *Surface water availability, Costs, Income, Geographical regions, North Dakota, Coals, Fuels, Fossil fuels, Montana, Wyoming, Industrial production, Planning, Coal mine wastes, Economics, State Governments, Water supply, Water utilization, Water users, Water demand, Water distribution(Applied), Cost-benefit analysis.

This report represents volume II of a two-volume study report on the analysis of the effects of alternative patterns of coal-based energy development in the Upper Great Plains on resource use, economic activity, and polulation distribution in the region. The volume addressed the effects of coal-based energy production on the region's land and water resources; Volume I addressed the effects on economic activity, population growth and settlement patterns, and the costs and revenues to State and local levels of government of coal development in the region. Volume II presented a detailed analysis of mined land reclamation costs in North Dakota (along with costs for selected mine sites in Montana and Wyoming); identified existing surface water supplies and use in the region; and discussed the impacts of alternative levels of coal development on water resources. Upper Great Plains energy development will have an impact on the region's water resources. It was concluded however, that available area water resources appear sufficient to satisfy needs of increased reliance on coal resources without undue hardship on sectors of the region's economy. Aggregate average water seemed available in sufficient quantity, but detailed planning will be needed for effective development. (Zielinski-IPA)

Descriptors: *Great Plains, *Coal mines, *Cost analysis, *Welfare(Economics), *Computer models, *Social impact, Costs, Income, Geographical regions, North Dakota, Coals, Fuels, Fossil fuels, Montana, Wyoming, Industrial production, Planning, Coal mine wastes, Economics, State Governments, Water supply, Water utiliztion, Water demand, Mathematical models, Cost-benefit analysis.

This report represents Volume I of a two-volume study report on the analysis of the effects of alternative patterns of coal-based energy development in the Upper Great plains on resource use, economic activity, and population distribution in the region. The volume addressed the effects on economic activity, population growth and settlement patterns, and the costs and revenues to State and local levels of government of coal development in the region; Volume II addressed the effects of coal-based energy production on the region's land and water resources. Volume I presented a detailed conceptual description of a computerized model proven useful in North Dakota for projection of economic, demographic and fiscal effects on coal development; an in-depth analysis of the effects of three alternative levels of North Dakota coal development (and brief summaries for Montana and Wyoming); and discussions of existing/potential measures for alleviation of adverse fiscal effects resulting from coal development, and of socio-economic charcteristics of the coal industry's Upper Great Plains work force and a local labor supply model. Shortfalls of front-end financing to offset rapid energy development growth effects appeared as the most serious potential fiscal difficulty for all government levels. (Zielinski-IPA)

ASSESSMENT AND RECOMMENDATIONS FOR COMMUNITY WATER RESOURCES PLANNING.
Skidmore, Owings, and Merrill, Boston, MA.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-137911, Price codes: A07 in paper copy, A01 in microfiche. Report submitted to the Office of Water Research and Technology, October, 1980. 132 p, 16 Fig, 80 Ref, 7 Append. OWRT-C-80104-P(No 8402)(1), 14-34-0001-8402.

Descriptors: *Planning, *Suburban areas, *Water resources development, *Local governments, *Legal aspects, State Governments, Massachusetts, Governmental interrelations, Federal Government, Governments, Administration, Water allocation(Policy), Water demand, Water distribution(Applied), Municipal water, Evaluation, Water conservation, Water utilization, Water management(Applied), Cities.

This study examined local planning in response to water supply shortages and related water quality and land management factors in a case study suburban town (Stoughton) near Boston, Massachusetts. Following initial survey of local water resource issues in the study town, the study team provided planning and technical assistance to aid the development of a local resource management strategy. A six-step planning process was prepared and tested, based on apparent guidance needs in resource planning techniques. It was concluded that local government appears to be the most appropriate body to deal with local resource mangagement issues, but also that it is often ill-equipped to do so. Local governments place heavy reliance on traditional structural solutions, which if inadequate, are replaced by more appealing non-structural options, yet, the latter often require sophisticated preparation/execution for success. These findings concur with regional, State, and Federal policies that emphasize local water resource self-sufficicency and resource preservation. Technical assistance efforts to communities are needed for communities to meaningfully respond to such policies. The study procedures employed have a broad potential application to numerous town and small cities in the United States. (Zielinski-IPA)

Water Supply and Management, Vol 2, No 2, p 159-176, 1978. 1 Fig, 3 Tab, 35 Ref. OWRT-C-4080(No 9017)(4).

Descriptors: *Environmental assessment, *Water resources planning, *Iterative open planning process(IOPP), *Evaluation, Environmental impacts, Regulation, Prediction, Impact identification, Models, Multi-objective planning, Research, Mathematical programming, Planning, Forecasting.

Since 1970 environmental assessments have been required for water resources planning studies undertaken by federal agencies responsible for water resources development in the U.S. These assessments are mandated by the National Environmental Policy Act of 1969 (NEPA) and by the Water Resources Council's 'Principles and Standards for Planning Water and Related Land Resources,' thereby elevating environmental quality to status of a formal planning objective. Environmental assessment methods are divided into three parts corresponding to impact identification, prediction and evaluation. For impact identification the methods are checklists, matrices, network diagrams and state-of-the-art reviews. Single discipline procedures (e.g., air, water quality models) and cross impact procedures (e.g., systems dynamics models) are methods for impact prediction. For impact evaluation there are environmental evaluation procedures (e.g., those using weighted average of factors); and multi-objective evaluation procedures (e.g., mathematical programming). However, studies indicate that the influence of environmental assessments on the outcome of water resources planning studies has not been great and there has been little integration of results into other aspects of the planning process. Environmental assessment activities can be linked with more traditional planning activities by the 'iterative, open planning process' method which relies on continual two-way communication between agency planners and interested citizens and government agencies. It also calls for the performance of four traditional planning activities: problem definition, formulation of alternatives, impact assessment and plan ranking. (Iervolino-NC)

DESIGNING EQUITABLE WATER RATES: WHAT MANAGERS NEED KNOW,
Illinois State Commerce Commission, Springfield.
W. J. Ide.
Journal of the American Water Works Association, Vol 72, No 10, p 564-569, October, 1980. 9 Ref.

Descriptors: *Water rates, *Pricing, *Utilities, Public utilities, Governments, Water users, Management, Costs, Replacement costs, Rehabilitation.

Factors involved in establishing rates for water usage are discussed. These factors include a study of the revenue requirements, an allocation of cost to various classes of users, and designing of the rate schedule. Revenue requirements for most government-owned utilities, however, are usually determined on a cash or budget basis and consist of estimated cash requirements. The emphasis placed on cash needs results from the fact that government-owned utilities are mainly backed by bonds which must be repaid in cash. Items that must be included in the budget are replacements, normal extensions of service, and normal improvements. Major improvements may be included as appropriations. Factors discussed in the design of rate structures include decreasing block rates, modified decreasing block rates, constant unit price rates, flat rates, off-peak, interruptible, and seasonal rates, conservation rates, lifeline rates, and availability charges. It is emphasized that, in the current socio-economic situation, consumers are becoming increasingly aware of rate increases, and that water-utility management must understand the fundamental principles involved in determining the necessary funds and designing equitable water rates. THE FUTURE OF AGRICULTURAL WATER USE IN NEW MEXICO,
New Mexico State Univ., Las Cruces. Dept. of Agricultural Economics and Agricultural Business.
G. Dawson.
In: A Quarter Century of Water Research, Proceedings of the Twenty-Fifth Annual New Mexico Water Conference, Apr. 24-25, 1980, WRRI Report No 124, Aug. 1980. p 203-217, 17 Ref. New Mexico Water Resources Research Institute, New Mexico State University, Box 3167 Las Cruces, NM 88003.

Descriptors: *New Mexico, *Agriculture, *Water quality, *Water costs, Food supply, *Economic impact, Farm management, Irrigation, Land use, Projections, Energy developments, Projected planning, Crop production, Regional economics.

The future availability of irrigated land for New Mexico is uncertain. Key elements of New Mexico's water law---doctrines of 'prior appropriation' and 'beneficial use'--- have met the state's agricultural water requirements to date. However, with demand outstripping supply, prices can and will be paid to shift water from agricultrual uses to 'higher valued' uses such as energy production. Depressed crop prices in 1979 and economic forecasts of low prices for 1980 may result in farmers' selling their water instead of their produce. The Federal Intermediate Credit Bank of Wichita reported that loans for farming production purposes were up 32% from 1978. Valley irrigated land values have been increasing at an annual rate surpassing 7%. Predictions for farming in the year 2025 must consider local economic entities, local consumption and local processing. The water available for future agricultural needs depends on proper planning for and reservation of irrigated lands, population changes and water demand, water conservation practices, legal and market conditions, and utilization of saline water. AN ANALYSIS OF RESIDENTIAL WATER DEMAND SCHEDULES IN ARKANSAS,
Arkansas Univ., Fayetteville. Water Resources Research Center.
R. K. Ford, and J. A. Ziegler.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-142309, Price codes: A06 in paper copy, A01 in microfiche. Report, October, 1980. 123 p, 27 Fig, 4 Tab, 52 Ref.

Descriptors: *Arkansas, *Model studies, *Pricing, *Elasticity of demand, *Statistical models, *Water demand, *Forecasting, Consumptive use, Optimum development plans, Data collections, Profiles, Indicators.

Increases in population and water use require evaluation of the production and distribution of water, an economic good. Economic models are developed which identify the major factors affecting residential demand for water in each of the five Arkansas Water Resources Planning Areas. These factors include the price of water, price of other goods, water uses, financial resources of consumers, and quality of the water. The models are then used to estimate the effects of different rate policies on water demand and water system revenues. Information was gathered on prospective dependent variables using questionnaires mailed to individual households throughout Arkansas. The models are also capable of generating estimates of future water demand under changing conditions, and are useful in local, state, and national level planning of water pricing and public policy. 6E. Water Law and Institutions

REASONABLE GROUND WATER PUMPING LEVELS UNDER THE APPROPRIATION DOCTRINE: LAW, POLICY AND ALTERNATIVES,

Idaho Univ., Moscow. Coll. of Law.
D. L. Grant.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-127540, Price codes: A06 in paper copy, A01 in microfiche. Idaho Water Resources Research Institute, University of Idaho Completion Report, September, 1980. 114 p, 222 Ref. OWRT-A-066-IDA(1), 14-34-0001-0114.

Descriptors: *Groundwater, *Water table, *Water supply, Water wells, *Pumping plants, Prior appropriation, *Legal aspects, Groundwater availability, Subsurface waters, Pumping, Appropriation, Appropriable waters, Public benefits, Public rights, Constitutional law, Local governments, States, State governments, Water policy, Hydrology, Hydrogeology, Surface-groundwater relationships.

This study noted that water agencies in most Western States have not been quick to issue pumping level regulations, and urged the development of regulations that would prevent pumping levels from dropping too far. The dilemma centers on the observations that (1) the determination of reasonable pumping levels depend much upon public consensus, (2) no public consensus has yet emerged, but (3) specific answers cannot be left to the future. Public participation was recommended not only to gather information, but to disseminate data that can assist in crystallizing public consensus. The overall study investigated what factors should be considered in setting reasonable pumping levels in appropriation doctrine States. Groundwater hydrology elements and other groundwater management tools that affect pumping levels in such States were described. Various reasonable pumping level statutes were compared and contrasted, and possible contribution of modern cost-benefit analysis to the setting of pumping levels was assessed. The need to integrate noneconomic or social goals as well was investigated. Finally, several alternatives to the reasonable pumping level approach were evaluated. (Zielinski-IPA)
W81-00510

REGIONAL FIVE-YEAR RESEARCH AND DEVELOPMENT PLAN FOR PERIOD 1982-1987. PACIFIC NORTHWEST/OCEANIA REGION.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-132110, Price codes: A02 in paper copy, A01 in microfiche. Report submitted to the Office of Water Research and Technology, November 1, 1980. 18 p, 6 Append.

Descriptors: *Research priorities, *Pacific Northwest U.S., *Alaska, *Guam, *Hawaii, Idaho, Oregon, Washington, Research and Development, Water Quality, Water supply, Groundwater, Water pollution, Streamflow, Coasts, Water use, Institutional constraints, Legal aspects, Anadromous fish, Fisheries, *Five-year plans.

This plan, prepared under the Directors of the Water Resources Research Center/Institutes of Alaska, Guam and Micronesia, Hawaii, Idaho, Oregon, and Washington, covers the 1982-1987 period for the Pacific Northwest/Oceanic region. Seven broad regional research objectives were identified. These cover methodology development to determine/evaluate instream flows, quantity and quality of groundwater resources, environmental/economic tradeoffs due to resource development; and evaluation of the effect of policies/laws pertaining to water allocations for native and Federal reserved land utilization, the effect of land/ocean resource use/development on coastal water quality, the effect of alternate energy development on water resource management/supply, and the effects of international/interstate laws on shared water resources. Identified special problems included the analysis of problems and issues affecting the ability to sustain current water uses, with particular attention to survival of anadromous fisheries. Research summaries of the six Centers/Institutes have been included as appendices. (Zielinski-IPA)

WATER RESOURCES RESEARCH NEEDS IN NEW ENGLAND,
Maine Univ. at Orono. Land and Water Resources Center.
S. S. Hasbrouck.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-131146, Price codes: A02 in paper copy, A01 in microfiche. Report submitted to the Office of Water Research and Technology, November, 1980. 17 p.

Descriptors: *Research priorities, *New England, *Water Resources, Research and Development, *Water quality, *Water supply, Connecticut, Maine, Massachusets, New Hampshire, Rhode Island, Vermont, Groundwater, Water pollution, Surface waters, Sewage effluents, Acidic water, Runoff, Flooding, Water conservation, Water management(Applied), *Five-year plans.

This report represented the New England regional summary, covering Connecticut, Maine, Massachusetts, New Hampshire, Rhode Island, and Vermont. A more thorough treatment of water research needs has been provided in the individual State reports. Water resource problems and associated research needs judged to be most critical from a broad New England regional perspective were assessed. Water resource problems affecting all New England States were categorized into water quality and water quantity issues. Water quality topics covered groundwater contamination/hazardous wastes; surface waters pollution by sewers; acid precipitation; runoff/lake eutrophication; recreation; and natural habitats protection. Identified water quantity topics were water supply and conservation; hydropower and other energy production; flooding and wetlands management; and allocation among competing demands. Technology transfer and information dissemination, regional allocation of water resources, and water resources and tourism were also considered. The widespread concern for groundwater management, acid rain, and institutional aspects of water resources management were identified as high priority candidates for regional emphasis. IMPLEMENTATION OF THE CONTROL OF POLLUTION ACT, 1974,
Severn-Trent Water Authority, Birmingham (England).
W. F. Lester.
Water Pollution Control, Vol 79, No 2, p 165-176, 1980. 1 Tab.

Descriptors: *Legislation, *Water pollution control, *Industrial wastes, *Sewage effluents, Municipal wastes, Pollution abatement, Water quality control, Pollutants, Water quality standards, Legal aspects, United Kingdom, Water Policy.

The Control of Pollution Act (COPA) was passed in Britain in 1974 and, although the segment dealing with waste disposal and the control of noise and of atomospheric pollution have been largely implemented, it will not be until 1980 that Part II, which cocerns water pollution, is implemented. Under the Act, the control of discharges of industrial and sewage effluent is extended to coastal waters and onto, as distinct from into, land. COPA provides for water authorities to renegotiate non-time-limited previous agreements made before 1937 concerning industrial effluent discharged into public sewers. Water authorities have the duty of stopping as soon as practicable pollution injurious to the fauna and flora of a stream produced as a consequence of a discharge, of arranging for the collection and disposal of waste from vessels, and of providing facilities for washing out sanitary appliances on vessels. The main benefit derived from the introduction of COPA will be in meeting the British government's desire for an open book approach to water pollution control work. The general public will be kept informed from advertisements relating to proposed significant new discharges and from public registers. A discussion follows the presentation of the paper. HOW TO KEEP AHEAD OF THE REGULATORS,
Metropolitan Water District of southern California, Los Angeles.
V. E. Gleason.
Journal of the American Water Works Association, Vol 72, No 10, p 548-553, October, 1980. 1 Tab, 52 Ref.

Descriptors: *Legislation, *Water treatment, *Water districts, Regulation, Federal government, State governments, Local governments, Potable water, Water supply, Public utilities, Public health.

This article serves as a summary of regulations that deal with water supply systems. The purpose is to acquaint water system operators with the types of regulations that affect them. As government involvement increases, the amount of legislation and regulations will also increase. Water utilities must monitor more closely than ever the quality of drinking water supplies. Cooperation and significant evidence of attempts to improve working relationships with federal regulators can lead to protection against liability for damages resulting from unforeseen incidents which fall under the responsiblity of the regulator. Federal regulations discussed are the Safe Drinking Water Act of 1974, the Clean Water Act of 1977, The Clean Air Act, the Resources Conservation and Recovery Act, the Hazardous Materials Transportation Act, the Occupational Safety and Health Act of 1970, and the National Energy Conservation Policy Act of 1978. State and local regulations that are significant to water system supervisors include public utilities acts, state water supply statutes, environmental statutes, and water supply agreements. (Baker-FRC)

THE NEW REGULATORY CONSTRAINTS: FROM CONFLICT TOWARD COMPROMISE,
Black and Veatch, Dallas, TX.
H. J. Graeser.
Journal of the American Water Works Association, Vol 72, No 10, p 542-547, October, 1980.

Descriptors: *Legislation, *Water resources development, *Water law, Law enforcement, Legal aspects, Water supply, Water pollution sources, Administrative agencies, Regulation, Governmental interrelations.

Many laws have been passed in recent years dealing with the water industry and the development of water resources in the U.S. Such laws were often difficult to interpret and thereby created conditions conducive to adversary relationships between opposing government agencies, special interest groups, and the general public. Specific examples of conflicting interests and legal slowdowns are offered. The Limestone Reservoir experience illustrates how the provision of a wildlife reserve took priority over the supplying of drinking water to the people of the region. A second incident in Shreveport, Louisiana describes how delays endangered the area through inadequate drought yield and potential contamination of a single water supply reservoir. Some revision of section 404 has been achieved, mainly to the benefit of the Department of Agriculture and the farm lobby. Additional problems created by these laws are exemplified in the design constraints imposed by regulations directed against the supposed threat of cancer from trihalomethanes in drinking water. Possible federal aid in establishing reasonable programs is described. (Baker-FRC)
W81-00591

THREADING THE REGULATORY MAZE: A SMALL UTILITY'S VIEW,
Thornton, CO.
C. R. Palmer, L. J. Gronning, and W. F. Ketellapper.
Journal of the American Water Works Association, Vol 72, No 10, p 554-557, October, 1980. 1 Fig.

Descriptors: *Federal government, *Municipal water, *Legal aspects, *Water policy regulation, Reservoir sites, Permits, Legal aspects, Planning,

Costs, Local governments, Governmental interrelations, Water resources development, Colorado.

The relationship of small municipal water authorities to the federal government is examined through the experiences of Thornton, Colorado and several other communities in the Denver region. Thornton has considered building a reservoir, but a reservoir built on private land without federal funds requires only a dredge and fill permit and review by the state engineer, while the same reservoir built on federal land or using federal funds requires approval by eleven additional federal agencies and two congressional committees. Thornton's membership in a Denver sewer district has brought the city into regulatory relationships with the EPA that have resulted in a 27% increase in chemical costs (for chlorination of raw water, the quality of which deteriorated after the Metro sewage treatment plant was loccated two miles upstream of the supply) and a need to restructure rate schedules. The Army Corps of Engineers has been reluctant to allow Thornton to reclassify an existing flood control reservoir as a multipurpose storage reservoir. Other communities have exerienced similar problems with regulatory agencies, sometimes resulting in added expense, long delays in obtaining permits and grants, and delivery problems. Under the recently introduced National Water Policy, increased state control of water planning and conservation programs are viewed as positive, but a stress on protecting unique historical and environmental areas and a requirement to quantify federal and Indian reserved water rights are viewed as potentially problematic for small communities. EFFICIENT GOVERNMENT INSTITUTION FOR WATER QUALITY CONTROL,
California Univ., Los Angeles.
F. L. Harder.
PhD dissertation, 1980. 100 p, 4 Fig, 6 Tab, 106 Ref, 17 Append.

Descriptors: *Government interrelations, *State governments, *Water law, *Economic efficiency, Model studies, Water quality standards, *Water pollution control, Efficiencies, Expenditures, Welfare(Economics), History, Stream gages, Water quality control.

The government budget on all levels has increased absolutely and relatively in America since World War II and a continually larger percentage of the nations's resources are managed or owned directly by the government sector. This study hypothesizes that new government institutions are set up as an efficient approach to welfare maximization in a changing society. Beginning with a discussion of Michigan water policy, an evaluation of government effectivess is made by studying water pollution control methods in all fifty states. A model of state behavior consistent with the welfare maximization theory is developed. Six hypotheses concerning efficient state behavior in the control of water quality are proposed, based on the assumptions of the model: (1) states supply collective goods for their constituents; (2) the federal effect is directed toward reduction of interstate externalities; (3) states with more water spend more per capita on water quality control; (4) the income elasticity for water quality expenditures is positive, but less than one; (5) states with more land spend less on water quality control; (6) states are guided by their constituents' preference functions. The hypotheses were tested using state expenditures data and data on the state utility and water quality control functions. All six hypotheses were confirmed. The study concludes that the welfare maximizing model is useful for explaining state water quality behavior and likely has much broader applications. (Garrison-Omniplan)

RECLAMATION LAW, WATER DISTRICTS, AND POLITICS IN THE KINGS RIVER SERVICE AREA OF CALIFORNIA - AN ALTERNATIVE FRAMEWORK FOR ANALYSIS,
California Univ., Los Angeles,
P. L. Ballard.
MS thesis, 1980. 107 p, 1 Fig, 11 Tab, 44 Ref. University of California, Los Angeles, Water Resources Center Archives.

Descriptors: *California, *Water rights, *Water law, *Local governments, *Government interrelations, *Federal reclamation law, Political constraints, Political aspects, Water resources development, Water districts, Central Valley project, Social aspects, Rivers, Irrigation, Reclamation.

California's history contains many accounts of bitter political struggles over water resource allocation. A case study of the Kings River Service Area is used to examine the predominance of political conflict as opposed to political consensus, ideological bias versus value-neutrality, and social group domination rather than public welfare as the major determinants of public water resource allocation. Three 'objective functions' of an 'irrigation community ' are hypothesized: popular participation, orderly conflict resolution, and local control. The conclusion is that the interests of large farmers are antithetical to the interests of the larger community whose residents receive little benefit from large-scale agricultural activities. Conditions of conflict are created which cannot be resolved within the framework of local political processes. A process is suggested to build the foundations for a reinterpretation of the politics of water that would include an analysis of political institutions, the relationship beween the state and the market, the economic relations of water resource management, and the consequences of specific strategies for regional and inter-regional development. (Garrison-Omniplan)

INSTITUTIONAL PROBLEMS OF WATER QUALITY PLANNING (SECTION 208) IN URBANIZING AREAS,
Phillips, Brandt, Reddick and Associates, Inc., Irvine, CA.
T. E. Smith, Jr., and B. Bruesch.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-136541, Price codes: A06 in paper copy, A01 in microfiche. Technical Report No 54-901, Prepared for Office of Water Research and Technology, October 1980. 65 p, 2 Fig, 7 Tab, 68 Ref. 3 Append. OWRT-C-90121-U(No 9432)(1), 14-34-0001-9432.

Descriptors: *Institutional constraints, *Legal aspects, *Water quality control, *Cities, *Federal Water Pollution Control Act, Water quality, Urban drainage, Urban runoff, Urbanization, Legislation, Water Quality Act, Water pollution, Surveys, Data collections, Evaluation, Census, Federal Government, Judicial decisions, Water law.

Institutional problems that occurred during development of areawide water quality management plans mandated by Section 208 of the Federal Water Pollution Control Act Amendments of 1972 (P.L. 92-500) were investigated. Definition of such problems included conflicts and general competition between governmental units. Telephone interviews with area Project representatives, and secondary materials, served to assess institutional-related problems in ten designated 208 areas, one from an urban or urbanizing area in each Federal Region. Identified institutional problems common to most areas studied were: (1) lack of implementing powers and authorities inherent in Councils of Governments, and the voluntary nature of member agency participation, offered difficulties to effective institutional arrangements: (2) most designated management agencies were reluctant to finance measures for nonpoint pollution sources abatement; and (3) small towns and special purpose districts lacked commitments to implement 208 plan recommendations due to financial/attitudinal reasons for future research on institutional problems were delineated. (Zielinski-IPA)
W81-00672

FIVE YEAR PLAN OF WATER RESOURCES RESEARCH AND DEVELOPMENT FOR CONNECTICUT,
Connecticut Univ., Storrs. Inst. of Water Resources.
R. Young.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-142291, Price codes: A04 in paper copy, A01 in microfiche. Report submitted to the Office of Water Research and Technology, October 1980. 58 p, 7 Fig, 13 Ref.

Descriptors: *Research priorities, *Connecticut, *Research and Development, *Water resources, Water quality, Water supply, Lakes, Rivers, Groundwater, Water conservation, Water pollution, Water management(Applied), Acidic water, Potable water, Waste water(Pollution), Wetlands, Leachates, Soils, Toxins, Institutions, *Five-year plans.

The dominant concern for Connecticut was identified as the need for improvement, control, and protection of its existing potable water sources, in addition to the prevention of further damage to water quality of lakes, rivers and groundwater by undesirable wastes coupled to efforts to clean up water quality impairment sources. The most complex areas for research were identified as those dealing with institutional, economic and legislative matters. Many of these must be resolved prior to application of existing technical solutions. Identified problems resided in the areas of surface and groundwater quality and quantity, natural resources and ecology, insitutional coordination and legislation, and technology related to lake restoration. Fourteen principal research topics were priority-ranked, led by economic/institutional relations for aquifer protection, incentives for water use conservation, and industrial wastes disposal/ treatment. The 14 topics were reduced by combination into seven research categories: acid precipitation; water resources allocation; drinking water and waste water; groundwater; lakes and wetlands; leachates and soils; and toxic and hazardous materials. Two funding allocations plans were developed for the research program elements. (Zielinski-IPA)

INSTITUTIONAL AND LEGAL PRESCRIPTION OF WATER USE AND MANAGEMENT,
Indiana Univ., Indianapolis. School of Law.
J. P. White.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-138042, Price codes: A05 in paper copy, A01 in microfiche. Water Resources Research Center, Purdue University, West Lafayette, Indiana, Technical Report, September, 1980. 80 p, 2 Tab, 2 Append. OWRT-C-2172(No 3405)(1).

Descriptors: *Institutional constraints, *Legal aspects, *Water use, *Water law, *Indiana, Water policy, Riparian rights, Institutions, Governments, Water rights, Judicial decisions, Federal Government, States, Lakes, Water levels, Water level fluctuations, Navigable waters, Streambeds, Water users, Legislation.

Indiana has one of the most comprehensive State water regulatory systems. This report surveyed Indiana statutes and court decisions governing water use, and has highlighted deficiencies within this network that could lead to unnecessary future litigation. Indiana code definition of a public fresh water lake could unjustly affect riparian landowners rights. The Indiana lake water level statute requires modification providing more definite criteria in determining average water levels, and to specifically include/exclude non-riparians who may affect or be affected by lake levels, such as drainage basin owners. Other needs areas included definition of a navigable stream; and interpretation of what constitutes domestic use. There has been little incidence of case law interpreting the water law statutes. This study concluded that, while Indiana courts possess the power to construe statutes when needed, interpretations or modifications of the statutes made now by the general assembly could eliminate the possiblity of many cases ever arising. An overview of the Indiana water law system was presented, with recommendations/suggestions for system improvements to assure that State future water needs are met. (Zielinski-IPA)
W81-00678

FIVE-YEAR RESEARCH PLAN,
Maine Univ. at Orono. Land and Water Resources Center.
S. S. Hasbrouck, and P. D. Uttormark.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-138026, Price codes: A03 in paper copy, A01 in microfiche. Report submitted to the Office of Water Research and Technology, October, 1980. 25 p, 3 Tab, 34 Ref.

Descriptors: *Research priorities, *Maine, *Planning, *Research and Development, *Water resources, Groundwater resources, Acidic water, Water quality, Water pollution, Lakes, Water wells, Water pollution effects, Wetlands, Recreation, Recreation facilities, Rivers, Water conservation, Water use, Water demand, Legal aspects, *Five-year plans.

This research plan was developed under the auspices of the Maine Land and Water Resources Council, with the Council's Subcommittee on River Basin Planning serving as the primary advisory group. The study was limited to freshwater resources, with emphasis on management-oriented research. Information from 39 interviews and relevant reports led to the identification of five major areas and associated subareas: (1) groundwater management (water quality of private wells; land use loadings to groundwater; long-term and cumulative effects of contamination on groundwater systems); (2) acid precipitation; (3) lake management (conservation and aesthetic protection of developing lakes; protection of 'wilderness' lakes; water quality protection and enhancement); (4) river, stream, and wetlands management (impacts of expanding hydropower; agricultural impacts; impacts of forest spraying; stormwater impacts); and (5) recreational use of Maine's inland waters (public/private conflicts; recreation potential; recreational carrying capacities). Each of these subareas has been evaluated under the categories of (1) problem or situation; (2) what is being done; (3) research needed; and (4) questions to be answered. Groundwater management and acid precipitation were identified as areas of highest research priority. Projected annual fiscal allocations for the cooperative program over the 1982-1986 timescale were also developed. (Zielinski-IPA)
W81-00683

1982-1986 RESEARCH AND DEVELOPMENT PLAN FOR FLORIDA WATER RESOURCES RESEARCH CENTER,
Florida Univ., Gainesville. Water Resources Research Center.
J. P. Heaney.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-138018, Price codes: A07 in paper copy, A01 in microfiche. Publication No 51, submitted to the Office of Water Research and Technology, October, 1980. 119 p, 16 Fig, 11 Tab, 51 Ref, 1 Append.

Descriptors: *Research priorities, *Florida, *Research and Development, *Water resources development, *Planning, Groundwater, Flood plains, Flooding, Saline water intrusion, Wetlands, Water pollution sources, Water quality, Water conservation, Drainage, Evaluation, Cost analysis, Institutions, Governments, Legal aspects, Institutional constraints, State Governments, *Five-year plans.

This research and development plan, developed from a variety of information resources, identified research needs in five categorical areas. The five identified areas (and the highest priority research needs in each respective area) were: (1) Atmospheric, Hydrologic and Hydraulic Processes (pollutants to groundwater, flood plains management, and saline intrusion); (2) Hydrologic-Ecologic Relationships (wetlands, lake and reservoir quality, non-point sources, and acid rain); (3) Water Quality Monitoring and Protection (water treatment processes); (4) Water Development, Use, Conservation, and Management (water conservation in industry and agriculture, and drainage); and (5) Institutional and Economic Analysis and Water Resources Planning (floods, integrating water and land use management, legal constraints, and control of water use). Florida's rainfall (annual average of 56 inches) replenishes streamflow and groundwater aquifers, with the Foridian aquifer serving as the major water supply source for the State. Much water movement in southern Florida is regulated by control structures, the largest State project of which is the Central and Southern Florida Flood Control Project. Close to seven billion gallons of water are withdrawn daily, about equally from surface sources and groundwater; and used for irrigation (42%), thermoelectric power generation (24%), public supply (16%), industrial purposes (14%), and rural supply (4%). (Zielinski-IPA)
W81-00684

A FIVE YEAR WATER RESEARCH PLAN FOR THE STATE OF ARKANSAS,
Arkansas Water Resources Research Center, Fayetteville.
R. E. Babcock.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-142283, Price codes: A04 in paper copy, A01 in microfiche. Publication No 72, submitted to the Office of Water Research and Technology, August, 1980. 45 p, 9 Tab.

Descriptors: *Research priorities, *Arkansas, *Planning, *Research and Development, *Water resources, Water resources development, Water quality, Groundwater, Water pollution, Mining, Aquifers, Waste water(Pollution), Legal aspects, State Governments, Institutions, Industrial wastes, Institutional constraints, Agriculture, Recreational facilities, Water demand, *Five-year plans.

Competing water resource needs in Arkansas fell into three major categories: agricultural activities; recreational and resort development; and municipal and light industry. Heavy industry (lignite mining and other energy-related processes) represents near-future water resource needs. Management of State water needs will depend on a consistent and available data base in concert with a functional institutional framework. Identified research priorities over 1980-1985 for the Arkansas Water Resources Research Center were summarized under four water categories established by the Commission on Natural Resources, National Research Council: (1) Atmospheric, Hydrologic, and Hydraulic Processes: hydrologic characteristics of the Vadose zone; and hydrologic inputs to water quality monitoring; (2) Ecological-Environmental Relationships: effects of contamination on aquatic ecosystems; (3) Water Quality Protection: waterborne virus research; and control of contaminants resulting from energy development, including lignite mining; and (4) Water Resource Management: comprehensive data base in information dissemination system development; and institutional framework studies on alternative ways of moderating conflicting water use needs. Six principal goals were identified for the Arkansas Water Research Center for the 1980-1985 period, including a comprehensive study of nutrient/sediment loading on Beaver Reservoir in northwest Arkansas and its impacts, and of waste water impacts on groundwater aquifers and impoundment eutrophication. (Zielinski-IPA)

FIVE-YEAR WATER RESOURCES RESEARCH AND DEVELOPMENT PLAN: FISCAL YEARS 1982-1986.
Washington State Water Research Center, Pullman.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-142259, Price codes: A03 in paper copy, A01 in microfiche. Report submitted to the Office of Water Research and Technology, October, 1980. 41 p, 2 Fig, 4 Tab, 47 Ref.

Descriptors: *Research priorities, *Washington, *Planning, *Research and Development, *Water resources, Water resources development, Water quality, Water quantity, Groundwater movement, Volcanoes, Water pollution, Water pollution sources, Legal aspects, State Government, Institutions, Institutional constraints, Fisheries, Toxicity, Pollutants, Water use, *Five-year plans.

Use of the State of Washington's water resources and identified water resource problems were summarized under water quantity, hydroelectric production, flooding potential, water quality concerns, waste disposal, groundwater and lake water quality, community water supplies, industrial concerns, fisheries, wild/scenic rivers, recreation, and effects of Mt. St. Helens. Research needs were assigned Highest, Intermediate, or Lowest priority rankings, based on specific ranking criteria. Those having highest priority rankings were identified under five research areas: (1) effects of Mt. St. Helens' eruption (toxic effects on salmon/steelhead fisheries; chemistry/products occurring in watersheds/waterways of devastated areas; watershed characteristics in devasted/ash-impacted areas; study of mud flow mechanics); (2) water quantity problems (irrigation conservation methods; groundwater movement and contaminant dispersion; dam safety; basic hydrologic/hydraulic studies); (3) water quality problems (measurement of pollutants entering major freshwater streams in urban/agricultural areas and major State groundwater aquifers; long-term accumulative effects on aquatic ecosystems; small hydroelectric development impacts); (4) institutional problems (studies on Federal-State conflicts on hydroelectric/agricultural development and fisheries survival; Indian reservations water use potential); and (5) fisheries problems (effects of river operations methods on anadromous fisheries; fishery habitat rehabilitation; mortality reduction for downstream migrants). (Zielinski-IPA)

REGIONAL FIVE-YEAR WATER RESEARCH AND DEVELOPMENT GOALS AND OBJECTIVES.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-137952, Price codes: A05 in paper copy, A01 in microfiche. Water Resources Research Institutes, Missouri River Basin States, Report submitted to the Office of Water Research and Technology, November 1980. 84 p, 14 Fig.

Descriptors: *Research priorities, *Missouri River, River basin, States, *Regional analysis, Planning, *Research and development, *Water resources, Water resources development, Water quality, Surface-groundwater relationships, Water conservation, Water utilization, Sediments, Pollutants, Irrigation efficiency, Institutions, State governments, Legal aspects, Institutional constraints, Wetlands, Riparian rights, *Five-year plans.

This coordinated regional plan for 1982-87 was prepared by the Directors of the Water Resources Research Institutes/Centers in the Missouri River Basin States (Iowa, Kansas, Missouri, Montana, Nebraska, North Dakota, South Dakota, Wyoming) that had each prepared five-year research and development plans. Thirty-eight regional problem areas were identified under six water research categories (water quantity, water quality, institutional water problems, utilization and conservation of water, energy-water relations, and ecological-environmental relationships in water resources). Fifteen of these problems were judged as highest priority for immediate attention: basin water distribution; groundwater systems and groundwater-surface water interaction dynamics; sediment; nonpoint pollution sources; State water development goals; control/ownership of waters; ground/surface water allocation; efficient water use in food/fiber production; lack of institutional incentives for conservation; conservation impacts on hydrologic systems; irrigation energy costs; energy development water needs; instream flow needs; wetlands hydrology dynamics; and sediments/pollutants impacts on aquatic/riparian ecosystems. Estimated funding percentages in the six research categories of the annual cooperative program for the eight regional States were developed. (Zielinski-IPA)

WATER RESOURCES RESEARCH PROGRAM: FIVE-YEAR PROJECTION (1982-1986), PENNSYLVANIA WATER RESOURCES RESEARCH CENTER,
Pennsylvania State Univ., University Park. Inst

for Research on Land and Water Resources.
A. J. McDonnell, and W. K. Hood, III.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-142275, Price codes: A04 in paper copy, A01 in microfiche. Report submitted to the Office of Water Research and Technology, December 1980. 52 p, 6 Fig, 15 Tab, 25 Ref, 2 Append. 14-34-0001-0140.

Descriptors: *Research priorities, *Pennsylvania, *Planning, *Research and development, *Water resources, Water quality, Water quantity, Water pollution, Water pollution sources, State governments, Institutions, Legal aspects, Institutional constraints, Waste water(Pollution), Waste water treatment, Acid mine water, Mine drainage, Waste disposal, *Five-year plans.

Significant issues identified relevant to water quality included groundwater pollution; non-point source pollution from acid mine drainage and other sources; environmental response/impact; and pollution control technology. Water quantity-related issues included stormwater drainage; floods; and surface/groundwater availability, supply, and use. The identified five-year research projections (1982-1986) included recommended programs in non-point source prediction and control; acid mine drainage control; acid precipitation; mine spoils reclamation; land cycling of wastes; treatment technology (including on-lot disposal); environmental assessment; stormwater management; in-stream needs; water conservation; groundwater management; and water allocation. Social, legal, economic, and other institutionally-related aspects pertinent to these areas were considered. Final specific activities fall under 11 Program Activity areas, covering floods, stormwater drainage, water supply, groundwater supply, environmental effects (including models), non-point source pollution, land disposal of wastes, energy/water interface, treatment technology, planning and management, and basic research - high risk. Waste water treatment and reuse is the highest funded present program area (32.7%) among seven other current program areas. (Zielinski-IPA)

6G. Ecologic Impact Of Water Development

PROMISING METHODOLOGIES FOR FISH AND WILDLIFE PLANNING AND IMPACT ASSESSMENTS,
Fish and Wildlife Service, Denver, CO.
L. R. Porter, G. W. Towns, L. W. Carlson, J. F. Hamill, and V. F. Fresquez.
Report, October 1979. 35 p, 8 Fig, 3 Tab, 5 Ref, 2 Append.

Descriptors: *Wildlife habitats, *Water resources development, *Coal mines, *Mapping, Planning, Methodology, Computer programs, Environmental effects, Fish, Stream fisheries, Reservoirs, Streamflow, Colorado, Yampa River basin.

The purpose of this study was to develop capabilities to: address incremental and cumulative impacts on fish and wildlife of multiple development actions in basin-wide settings, and evaluated alternative development scenarios from the standpoint of impacts on fish and wildlife. The Yampa River basin in northwest Colorado was used as the study area. Tools and methods described include a computerized Geographic Information System (GIS), conflict mapping, ranking of project impacts, and prediction of fish habitat changes resulting from multiple water developments. The GIS allowed manipulation and analyses of mapped information that would have been impractical manually. Mapped wildlife data were composited to determine habitat values of land units in the study area. Proposed locations of coal and water developments were overlaid on the composited wildlife maps to identify potential conflicts. A method was devised to quantify and compare relative impacts of different development scenarios on wildlife. A reservoir-streamflow analysis was initiated to predict changes in stream fisheries habitat resulting from proposed water developments. (Moore - SRC)

A WATERSHED INFORMATION SYSTEM,
Colorado State Univ., Fort Collins. Dept. of Earth Resources.
A. G. Thomsen, and W. D. Striffler.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-127433, Price codes: A07 in paper copy, A01 in microfiche. Colorado Water Resources Research Institute, Colorado State University Completion Report 100, September 1980. 97 p, 57 Fig, 34 Tab, 19 Ref. OWRT-B-160-COLO(8).

Descriptors: *Remote sensing, *Model studies, *Mountain watersheds, Hydrology, Snowmelt, Runoff forecasting, Topography, Vegetation, Soils, Forest management, Watersheds(Basins), Mapping, *Colorado, *Rocky Mountains, *Landsat.

A watershed information system for the analysis and simulation of mountain watersheds is described. Watershed information on topography, vegetation and soils in digital terrain models (overlays) serve as the data base for watershed analysis, classification of snow in Landsat imagery and automatic generation of parameter decks for operating distributed simulation models of snowcover dynamics and streamflow generation. The computer programs that generate the parameter decks have built-in calibration options for all major processes, that permit fast model calibration from an interactive computer terminal, on watersheds with varying characteristics. Options are available for simulating the effects of forest management alternatives (thinning, clearcutting) on selected forest stands. Snow course measurements and Landsat imagery are used for simulation update. Examples of output from subsystems are included to illustrate the capabilities of the information system.

BASE PEAK PROFILES OF GAS CHROMATOGRAPHY-MASS SPECTROMETRIC DATA OBTAINED FROM THERMAL DESORPTION OF ACTIVATED CARBONS,
New York State Dept. of Health, Albany. Div. of Labs. and Research.
K. Alben.
Analytical Chemistry, Vol 52, No 12, p 1821-1824, October, 1980. 3 Fig, 1 Tab, 18 Ref.

Descriptors: *Adsorption, *Activated carbon. *Waste water treatment, *Gas chromatography, *Spectrophotometry, Liquid wastes, Water quality control, Data storage and retrieval, Engineering, Sampling, Computer models, Organic wastes, Volatility, Thermal properties, Chemical properties, Analytical techniques.

Thermal desorption gas chromatography-mass spectrometry is a sensitive specific method for analyzing volatile compounds. It has potential application in monitoriing the abundance and chemical composition of organic substances removed by adsorption onto activated carbon in waste water treatment. This method produces electron impact data and chemical ionization data which can be stored in two-dimensional base peak format. Such data reveals the chemical identity of organic compounds and can be used by engineers and chemists. The format is useful in comparative studies and for historical profiles. In samples drawn from water treatment plants, major contaminants were identified from 0.1 g of carbon. This method is more sensitive than the carbon chloroform extraction method, and it can be applied to more volatile compounds. Its disadvantage is the complexity of the data which requires an on-line computer for acquisition, storage, and interpretation. (Titus-FRC)

DETERMINATION OF CHEMICAL OXYGEN DEMAND USING AN OPEN-TUBE METHOD,
Yorkshire Water Authority, Leeds (England). Office of Scientific Services.
K. E. De Casseres.
Water Pollution Control, Vol 79, No 1, p 143-145, 1980. 4 Tab, 7 Ref.

Descriptors: *Chemical oxygen demand, *Analytical techniques, *Testing procedures, *Laboratory equipment, Safety factors, Aromatic compounds, Laboratory tests, Methodology, Statistics, Water vapor, Volatility, Sewage treatment, Digestion, Oxygen requirements, Water quality, Pollutants, Water analysis.

COD of water samples was determined by a semi-micro open-tube method. Results were compared with those obtained by a conventional sealed-tube method. Tests for precision, percent recovery using synthetic COD standards, recovery of volatile compounds, and COD determined in real samples showed that the open-tube method is comparable to the closed-tube method with safer operating capabilities. For example, mean by analysis in mg/liter of potassium hydrogen phthalate samples with a theoretical COD of 800 mg/liter was 789 by open tube and 809 by sealed tube; corresponding figures for percent recovery were 98.6 and 101.1%. Mean recovery by open tube and sealed tube, respectively, of ethanol (500 mg/liter) was 479 and 481, of methyl-iso-butyl ketone (700 mg/liter) was 644 and 639, and of acetone (500 mg/liter) was 463 and 458. Mean COD in mg/liter in real samples by open and sealed tubes, respectively, was 265 and 275 for domestic crude sewage and 304 and 314 for industrial crude sewage. In addition, the open-tube method may be conducted using larger tubes (26 mm) and cones to permit in situ titration. However, smaller tubes offer more advantages when large numbers of COD analyses must be carried out. (Geiger-FRC)

ON-COLUMN CRYOGENIC TRAPPING OF SORBED ORGANICS FOR DETERMINATION BY CAPILLARY GAS CHROMATOGRAPHY,
Washington Univ., Seattle Dept. of Environmental Health.
D. Kalman, R. Dills, C. Perera, and F DeWalle.
Analytical Chemistry, Vol 52, No 12, p 1993-1994, October, 1980. 3 Fig, 8 Ref.

Descriptors: *Gas chromatography, *Separation techniques, *Cryogenics, *Organic compounds, Analytical techniques, Design data, Collants, Laboratory test, Waste water, Sludge, Mass spectrometry, Condensation, Water analysis.

A simple on-column cryogenic trap for capillary analysis which can be made from common materials is described. The trap can be used for the purge-and-trap analysis of waste water and sludge samples by capillary column gas chromatography when the sample is complex and additional resolution is required. Three different cold trap designs were tested; all three used liquid nitrogen as the coolant. The first (design A) used copper as the trap, the second (design B) used aluminum plates and the third (design C) used stainless steel tubing. All three designs were mountable form a central support or could be supported by the liquid nitrogen supply tube. Each covered about 10 cm of the column providing a residence time of about 0.2 seconds for flow rates between 1 and 2 ml/minute. Thirty-four samples representing all of the EPA priority purgables except arolein and acrylonitrile were tested on the three traps and were analyzed by gas chromatography. Results from design A showed poor peak shape Lnd occasional split peaks for compounds more volatile than dichloromethane. Design B gave satisfactory resolution but its equipment was considered too cumbersome to install. Design C offered good resolution performance plus ease of installation to capillary columns. The flow of coolant and air to and from the trap can be readily automated. This cryogenic trap may also be used for headspace analysis and for determining concentrations of organics form large gas samples. (Geiger-FRC)

DETERMINATION OF ALPHA-CHLOROACETANILIDES IN WATER BY GAS CHROMATOGRAPHY AND INFRARED SPECTROMETRY,
Monsanto Agricultural Products Co., St. Louis, MO. Research Dept.
J. W. Worley, M. L. Rueppel, and F. L. Rupel.
Analytical Chemistry, Vol 52, No 12, p 1845-1849, October 1980. 9 Fig, 2 Tab, 9 Ref.

Descriptors: *Water analysis, *Gas chromatography, *Spectrometry, *Alpha-chloracetanilides, Chemical analysis, Herbicides, Water quality, Regression analysis, Analytical techniques, Statistical methods, Water pollution sources.

General sampling and analytical methods for determination of members of the herbicidal alpha-chloroacetanilide class at low ppb levels (0.5-14.3 ppb) in water are reported. The method includes extraction of a water sample with methylene chloride, concentration and solvent exchange for toluene/methanol, and gas chromatographic (GC) analysis. Quantitation is done by a nitrogen-selective detector. Structural confirmation is by on-the-fly GC-infrared (GC-IR) spectrometry. Recovery and linearity of response for each of the seven acetanilides investigated by nitrogen-selective GC from low ppb levels up to 100-300 ppb levels were found to be excellent. The method was rigorously validated in the 0.2-10 ppb range. GC-IR spectrometry provided useful chemigrams (time-dependent plots of the infrared absorbance integrated over a chosen frequency range) and characteristic infrared spectra from mixtures containing 1.0 micrograms of each of the acetanilides tested. GC-IR is therefore a viable tool for confirming structures of acetanilides in water at low ppb levels. (McKeon-FRC)

GAS CHROMATOGRAPHIC-MASS SPECTROMETRIC ANALYSIS OF CHLORINATION EFFECTS ON COMMERCIAL COAL-TAR LEACHATE,
New York State Dept. of Health, Albany. Div. of Labs. and Research.
K. Alben.
Analytical Chemistry, Vol 52, No 12, p 1825-1828, October, 1980. 5 Fig, 1 Tab, 23 Ref.

Descriptors: *Chlorination, *Organic compounds, *Coal tar coatings, *Potable water, Halogens, Leachate, Water pollution sources, Chemical reactions, Water analysis, Gas chromatography, Mass spectrometry, Laboratory tests, Analytical techniques, Linings.

Mass spectrometric analyses suggest that chlorination significantly modifies the distribution of polycyclic aromatic hydrocarbons (PAH) in samples of commercial coal-tar leachate. Coal tar is often used as a lining for storage tanks and pipes in water supply systems. Analyses of mutagenic base-neutral compounds were conducted for laboratory samples of coal-tar leachate and chlorinated coal-tar leachate. The chlorinated samples revealed diminished concentrations of phenanthrene and fluoranthene and the absence of higher-molecular-weight PAH. Fluorene became prominent, oxygen-substituted PAH increased, and new oxygenated compounds were found. Intermixed with these were low concentrations of chlorine- and bromine-substituted PAH. Such chlorine and bromine compounds have also been found in investigations of chloroform produced by chlorination of potable water. Chlorination of coal-tar leachate is further expected to result in the formation of PAH with polar acidic function groups. Further studies of potable water systems for evidence of coal-tar contamination should benefit by screening for effects observed experimentally. (Titus-FRC)

ON THE VALIDITY OF THE CODISTILLATION MODEL FOR THE EVAPORATION OF PESTICIDES AND OTHER SOLUTES FROM WATER SOLUTION,
Oregon State Univ., Corvallis. Enviromental Health Sciences Center.
C. T. Chiou, and M. Manes.
Environmental Science and Technology, Vol 14, No 10, p 1253-1254, October, 1980. 6 Ref.

Descriptors: *Distillation, *Pesticides, *Model studies, *DDT, *Polychlorinated biphenyls, Evaporation, Water vapor, Vapor pressure, Aqueous solutions, Chlorinated hydrocarbon pesticides, Solutes, Gas chromatography, Analytical techniques, Laboratory tests.

Evidence is presented to demonstrate that the codistillation model is invalid when chemical-water mixtures are evaporated in a highly humid or supersaturated atmosphere. The model was originally supported by agreement of results from conventional steam distillation calculations with data on evaporative loss rates of pesticides and water. The present study showed that rapid evaporative loss of some low-vapor-pressure compounds from water is not always due to codistillation. When a stream of air maintained at 25C and a relative humidity of 98% was passed over water containing DDT, after 64 hours, the solution gained 412 g of water and lost 76% of its DDT by evaporation. Similarly, an aqueous solution of PCB at 0-2C gained 45 mg of water and lost 20% of its PCB when left for 6 hours in ambient air 0f 25C and 36% relative humidity. Since the evaporative loss of water and solute may occur independently of each other, it was suggestd that another term besides codistillation be used to describe such evaporative losses so that mechanistic coupling of two separate processes will not be assumed. (Geiger-FRC)

WATER SOLUBILITY AND OCTANOL/WATER PARTITION COEFFICIENTS OF ORGANICS. LIMITATIONS OF THE SOLUBILITY-PARTITION COEFFICIENT CORRELATION,
Syracuse Research Corp., NY. Life Sciences Div.
S. Banerjee, S. H. Yalkowsky, and S. C. Valvani.
Environmental Science and Technology, Vol 14, No 10, p 1227-1229, October, 1980. 2 Fig, 1 Tab, 11 Ref.

Descriptors: *Solubility, *Mathematical models, *Organic wastes, Water pollution, Adsorption, Water quality, Standards, Laboratory tests, Volatility, Aromatic compounds, Analytical techniques, Organic compounds, Equations.

The 1-octanol/water partition coefficient (K) has been used extensively in environmental fate studies to predict biological and physical phenomena such as bioaccumulation and soil adsorption. The water solubility (S) and K values for 27 organic compounds from the list of 65 Consent Decree Chemicals for which the US EPA is currently recommending water-quality criteria were determined from radioactively labeled samples. Results showed that the previously described Chiou correlation between K and S was not always valid for solids with high melting points. It was recommended that estimations of K or S for liquids should be made using the Hansch correlation. Another equation was proposed for estimating K or S for solids with known melting points. When the melting point is not known, the estimate may be made from an average value of KS obtained from compounds of similar structure. Tests with the high-melting compound RDX demonstratd that a serious error may result when Chiou's correlation is applied indiscriminantly for the determination of K or S (Geiger-FRC)

INTRODUCTION (SPECIAL ISSUE ON THE PROGRESS OF AN ON-GOING PROGRAM TO IMPROVE METHODOLOGIES FOR THE ANALYSIS OF PRIORITY POLLUTANTS IN WASTE WATER EFFLUENTS),
Villanova Univ., PA.
R. L. Grob.
Journal of Environmental Science and Health (A), Vol 15, No 5, Special Issue, p 379-391, 1980.

Descriptors: *Pollutant identification, *Analytical techniques, *Data collections, Water pollution sources, Environmental Protection Agency, Separation techniques, Gas chromatography, Industrial wastes, Legislation, Methodology, Waste water(Pollution), Effluents.

A special issue of the journal is devoted to reporting progress in an on-going program to improve analysis methodologies for priority pollutants in industrial waste water effluents. Relevant legislation and the history of the Organic Chemicals Branch of the EPA in developing regulatory guidelines and applicable methodologies are reviewed. A program devised to develop the Best Available Control Technology Economically Achievable (BAT) analytical data base incorporates screening to determine which of the 129 priority pollutants are present, verification to quantify the pollutant load of industrial products/processes and the performance of treatment systems, and self-monitoring to extend the first two stages by adding time depth to the data base. Methods have been published in the Federal Register. Validation of analytical procedures used in these methods, especially in verification, requires the development of new techniques suited to specific matrices. Gas chromatography/conventional detector methodology was selected for verification because it allows generally superior quantification via recovery data, it is more cost effective for samples containing few priority pollutants, it allows faster laboratory turnaround, and instruments and qualified personnel are widely available. Performance and cost expectations have proved accurate. All 13

methods for 14 classes of organic priority pollutants use microextraction, headspace, or purge and trap (heated/unheated) extraction techniques. Cooperation among industry, private laboratories, and government agencies emerges as a dominant theme in this program. (Just-FRC)

AN AUTOMATED METHOD FOR THE SIMULTANEOUS DETERMINATION OF NITROGEN AND PHOSPHORUS IN PLANT MATERIAL, SLUDGE AND SOIL,
Water Research Centre, Stevenage (England).
K. W. Petts, and M. Belcher.
Water Pollution Control, Vol 79, No 3, p 399-404, 1980. 1 Fig, 6 Tab, 1 Ref.

Descriptors: *Analytical techniques, *Colorimetry, *Phosphorus, *Nitrogen, Spectrophotometry, Ammonia, Phosphorus compounds, Sludge, Soil analysis, Nutrients, Chemical analysis, Plant tissues, Sewage sludge, Digestion, Sampling.

This semi-automated method for the determination of nitrogen and phosphorus involves controlled digestion with sulfuric acid of up to 40 samples in a thermostatically regulated heating block, followed by automatic colorimetric analysis of the digest solutions for both amonia and orthophosphate concentrations. Nitrogen and phosphorus are determined in concentration ranges of 0-2.25% and 0-0.75% respectively. Materials with greater concentrations of these elements can be diluted. The method is discussed in detail with a description of the pretreatment of samples, digestion procedure, presision, accuracy, standards, reagents, and analytical procedure. Where the color of the acid digest solution may influence the calculated phosphorus content, a correction may be applied by using a conversion table. Since it is difficult to produce standard samples of plant material, sludge, and soil, it is suggested that the standard samples should be samples of the material being investigated. Using this analytical procedure, one analyst can run 80 samples per day. (McKeon-FRC)

BIOOXIDATION IN A CONTINUOUS ACTIVATED SLUDGE PROCESS,
Instytut Kształtowania Środowiska, Katowice (Poland). Dept. of Water and Wastewater Treatment.
J. Suschka.
Water Research, Vol 14, No 3, p 197-205, March, 1980. 14 Fig, 6 Tab, 16 Ref.

Descriptors: *Oxidation, *Activated sludge, *Mathematical models, Biodegradation, Bilogical treatment, Chemical degradation, Waste water treatment, Equations.

An extensive examination of the biochemical oxidation rate theory in the activated sludge process has suggested the need for a new critical equation to relate the overall biochemical reaction rate on the activated sludge to the oxidation process. The new equation which was based on many years of laboratory tests, pilot studies, and full scale experiements, calculates the substrate removal rate as a function influent and effluent substate concentration and detention time. Application of the equation showed that the overall reaction rate of sludge biochemical oxidation was not dependent on the substrated concentration in the effluent. Results of treatments by single and multistage activated systems may be predicted from the proposed equation. It seems feasible that the suggested equation may be used in process modelling because of its proven validity in wide ranges of activatd sludge loads. However, a commentary on the proposed new equation points out that the evidence to back up the mathematical model proves poor in most cases and this solution to the problems of measuring the kinetics of biodegradation may be illusory. A LABORATORY DATA-PROCESSING SYSTEM,
Severn-Trent Water Authority (England). Upper Trent Div.
D. R. Woods, M. D. Frayn, and R. S. Walker.
Water Pollution Control, Vol 79, No 1, p 42-55, 1980. 3 Fig, 6 Tab, 4 Ref.

Descriptors: *Computer programs, *Data storage and retrieval, *Data processing, *Laboratory tests, *Water sampling, Data collections, Monitoring, Water analysis, Measurement, Chemical analysis, Automation.

An experimental laboratory data-processing system provides a controlled method for the calculation of analytical results from raw data and for compiling routine analytical reports on sewage effluent samples. The system processes data on samples generated by a routine timetable from known sources. It utilizes a desk-top computer and line printer for which a 5 digit coding system was developed. Programs for all calculations of results for regular chemical determinations of water quality were constructed. In addition, utility programs were developed to edit stored data and to list out samples and their values. Raw data is stored in individual files assembled after analysis. Programs and data files for specified analyses are housed on a single tape and can be output separately. Each program includes instructions to flag gross errors and errors of analytical inaccuracy, and checks against predetermined limits. This system is more versatile than manual methods and increases the rate of throughput of samples. It is limited by the small storage capacity of the tapes. (Titus-FRC)

FRESHWATER USE CUSTOMS ON ROTA: AN EXPLORATORY STUDY.
Guam Univ., Agana. Water Resources Research Center.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-131476, Price codes: A08 in paper copy, A01 in microfiche. Technical Report No 17, 1980. R. A. Stephenson and D. Moore, Editors, 141 p, 37 Photo, 10 Fig, 86 Ref, 2 Append. OWRT A-009-GUAM(2), 14-34-0001-8012, 9012.

Descriptors: *Freshwater, *Water supply, *History, Available water, Water utilization, Behavior, Social values, Social aspects, Guam, *Rota, *Mariana Islands, Micronesia.

Seventy-one Rotanese informants recounted in detail their customs, practices and beliefs concerning freshwater uses before and during World War II to the research team. An archaeological survey was also conducted to suggest possible locations of freshwater sources on Rota in prehistoric and historic times. Research on the ethnohistory of Rota serves to link the past to the present. The results of the research suggest that consistency is shown on Rota from the past to the present in regard to the value of freshwater. Before and during the war, local people were resourceful in building catchments, wells, and the like in order to insure sufficient supplies of freshwater. In the present, Rotanese people express confidence that they will continue to have sufficient supplies of freshwater to meet their daily needs.

STRUCTURE CONTOUR MAP OF THE MADISON GROUP, HAVRE 1 DEGREE BY 2 DEGREE QUADRANGLE, NORTH-CENTRAL MONTANA,
Geological Survey, Billings, MT. Water Resources Div.
R. D. Feltis.
Available from Montana Bureau of Mines and Geology, Butte, MT. Price $2.50. Montana Bureau of Mines and Geology Geologic Map 9, 1980. 1 Sheet, 2 Ref.

Descriptors: *Maps, *Hydrogeology, *Geohydrologic units, *Aquifers, *Montana, Structural geology, Faults(Geologic), Carbonate rocks, Subsurface mapping, *Madison Group, *Havre quadrangle, Bearpaw Mountains arch, Little Rocky Mountains, Hogeland basin, *Water-bearing formations.

The configuration of the top of the Madison Group, of Mississippian age, is shown by contours on a base map at a scale 1:250,000. The map is one of a series of maps produced as part of a regional study of the geohydrology of the Madison Group in north-central Montana. Contour intervals are 100 and 500 feet. The configuration map shows the approximately 50-mile-long west-trending Bearpaw Mountain arch (Bearpaw Mountains), with the Hogeland basin to the north along the international boundary. The steep dips along the north edge of the Little Rocky Mountains show the effect of a massive laccolith that uplifted and tilted sedimentary rocks. Detailed structural geology is not shown, but a stippled pattern shows where complex folding and faulting of the rocks probably have occurred. (USGS)

STRUCTURE CONTOUR MAP OF THE TOP OF THE MADISON GROUP, GREAT FALLS 1 DEGREE BY 2 DEGREE QUADRANGLE, NORTH-CENTRAL MONTANA,
Geological Survey, Billings, MT. Water Resources Div.
R. D. Feltis.
Available from Montana Bureau of Mines and Geology, Butte, MT. Price $2.50. Montana Bureau of Mines and Geology Geologic Map 10, 1980. 1 Sheet, 3 Ref.

Descriptors: *Maps, *Hydrogeology, *Geohydrologic units, *Aquifers, *Montana, Structural geology, Faults(Geologic), Carbonate rocks, Subsurface mapping, *Madison Group, *Great Falls quadrangle, Sweetgrass arch, Little Belt mountains, Highwood mountains, Disturbed belt, *Water-bearing formations.

The configuration of the top of the Madison Group, of Mississippian age, is shown by contours on a base map at a scale of 1:250,000. The map is one of a series of maps produced as part of a regional study of the geohydrology of the Madison Group in north-central Montana. Contour intervals are 100 and 500 feet. The configuration map shows mostly a moderate dip northeast from the South arch part of the Sweetgrass arch and from the north flank of the Little Belt Mountains. Southwest of the south arch the dip is steeper into the area of the disturbed belt. At the northeast side of the Little Belt Mountains the dip is into the Judith Basin (east of map area). In the Highwood Mountains area, where igneous instrusions of Tertiary age occur, the Madison Group has not been uplifted enough to be exposed at the surface, and the contour alignment is only slightly more erratic than in surrounding areas. Detailed structural geology is not shown, but a stippled pattern shows areas where complex folding and faulting of the rocks probably have occurred. (USGS)

STRUCTURE CONTOUR MAP OF THE TOP OF THE MADISON GROUP, SHELBY 1 DEGREE BY 2 DEGREE QUADRANGLE, NORTH-CENTRAL MONTANA,
Geological Survey, Billings, MT. Water Resources Div.
R. D. Feltis.
Available from Montana Bureau of Mines and Geology, Butte, MT. Price $2.50. Montana Bureau of

Mines and Geology Geologic Map 11, 1980. 1 Sheet.

Descriptors: *Maps, *Hydrogeology, *Geohydrologic units, *Aquifers, *Montana, Structural geology, Faults(Geologic), Carbonate rocks, Subsurface mapping, *Madison Group, *Shelby quadrangle, Sweetgrass hills, Kevin-Sunburst dome, Scapegoat-Bannatyne trend, *Water-bearing formations.

The configuration of the top of the Madison Group, of Mississippian age, is shown by contours on a base map at a scale of 1:250,000. The map is one of a series of maps produced as part of a regional study of the geohydrology of the Madison Group in north-central Montana. Contour intervals are 100 and 500 feet. The configuration map shows mostly the northeast regional dip from the Sweetgrass arch (southwest of map area). The map also shows most of the Kevin-Sunburst dome. The steeply dipping structure around the laccoliths that formed the Sweet Grass Hills along the international boundary is in marked contrast to the more gentle dips across the rest of the map. Detailed structural geology is not shown, but a stippled pattern shows areas where complex folding and faulting of the rocks probably have occurred. (USGS)

STRUCTURE CONTOUR MAP OF THE TOP OF THE MADISON GROUP, LEWISTOWN 1 DEGREE BY 2 DEGREE QUADRANGLE, NORTH-CENTRAL MONTANA,
Geological Survey, Billings, MT. Water Resources Div.
R. D. Feltis.
Available from Montana Bureau of Mines and Geology, Butte, MT. Price $2.50. Montana Bureau of Mines and Geology Geologic Map 12, 1980. 1 Sheet, 4 Ref.

Descriptors: *Maps, *Hydrogeology, *Geohydrologic units, *Aquifers, *Montana, Structural geology, Faults(Geologic), Carbonate rocks, Subsurface mapping, *Madison Group, *Lewistown quadrangle, Little Rocky Mountains, North Moccasin Mountains, South Moccasin Mountains, Judith Mountains, Cat Creek anticline, Blood Creek syncline, Big Snowy anticlinorium, Judith Basin, *Water-bearing formations.

The configuration of the tip of the Madison Group, of Mississippian age, is shown by contours on a base map at a scale of 1:250,000. The map is one of a series of maps produced as part of a regional study of the geohydrology of the Madison Group in north-central Montana. Contour intervals are 100, 500, and 1,000 feet. The configuration map shows the location of the Blood Creek syncline, a broad, rather shallow, east-plunging structural depression bordered on the northeast by the Little Rocky Mountains and on the south by the Judith Mountains and Cat Creek anticline of the Big Snowy anticlinorium. The steeply dipping structure around the several mountains shows the effect of massive laccolithic intrusions of Tertiary age that uplifted and tilted the sedimentary rocks. A major fault extends along the steep northeast flank of the Cat Creek anticline. West of the North and South Moccasin Mountains, the Judith Basin is shown as a major south-trending reentrant from the Madison Group, which regionally dips northeast. Detailed structural geology is not shown, but a stippled pattern shows where complex folding and faulting of the rocks probably have occurred. (USGS)

WATER RESOURCES DATA FOR MASSACHUSETTS AND RHODE ISLAND, WATER YEAR 1979.
Geological Survey, Boston, MA. Water Resources Div.
Geological Survey Water-Data Report MA-RI-79-1, September, 1980. 349 p, 5 Fig.

Descriptors: *Massachusetts, *Rhode Island, *Hydrologic data, *Surface waters, *Groundwater, *Water quality, Gaging stations, Streamflow, Flow rates, Sediment transport, Water analysis, Water temperature, Chemical analysis, Lakes, Reservoirs, Water wells, Water levels, Data collections, Sites.

Water-resources data for the 1979 water year for Massachusetts and Rhode Island consist of records of stage, discharge, and water quality of streams; contents of lakes and reservoirs; and ground-water levels. This report contains discharge records for 102 gaging stations, monthend contents for 30 lakes and reservoirs, water quality for 26 gaging stations, and water levels for 108 observation wells. Also included are data for 19 low-flow and 20 crest-stage partial-record stations. Additional water data were collected at various sites, not part of the systematic data-collection program, and are published as miscellaneous measurements. A few pertinent stations (not included above) in bordering States are also included in this report. These data represent that portion of the National Water Data System operated by the U.S. Geological Survey and cooperating State and Federal agencies in Massachusetts and Rhode Island. (USGS)

WATER RESOURCES DATA FOR COLORADO, WATER YEAR 1979--VOLUME 1. MISSOURI RIVER BASIN, AKANSAS RIVER BASIN, AND RIO GRANDE BASIN.
Geological Survey, Lakewood, CO. Water Resources Div.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-124992, Price codes: A22 in paper copy, A01 in microfiche. Geological Survey Water-Data Report C0-79-1, August 1980. 499 p, 4 Fig, 4 Tab.

Descriptors: *Colorado, *Hydrologic data, *Surface waters, *Groundwater, *Water quality, Gaging stations, Streamflow, Flow rates, Sediment transport, Water analysis, Water temperature, Chemical analysis, Lakes, Reservoirs, Water wells, Water levels, Data collections, Sites, *Missouri River basin(CO), *Arkansas River basin(CO), *Rio Grande basin(CO).

Water-resources data for Colorado for the 1979 water year consist of records of stage, discharge, and water quality of streams; stage, contents, and water quality of lakes and reservoirs, and water levels and water quality of wells and springs. This report (volumes 1, 2, and 3) contains discharge records for about 460 gaging stations, stage and contents of 22 lakes and reservoirs, 4 patial-record low-flow stations, 93 crest-stage partial-record stations, and 200 miscellaneous sites; water quality for 143 gaging stations and 130 miscellaneous sites; and water levels for 55 observation wells. A few pertinent stations in bordering States are also included in this report. The records were collected and computed by the Water Resources Division of the U.S. Geological Survey. These data represent that portion of the National Water Data System collected by the U.S. Geological Survey and cooperating State and Federal agencies in Colorado. (USGS)

SCREENS FOR WATER INTAKES,
Beaudry (E.) and Cie, Paris (France). (Assignee).
P. Jackson.
U.S. Patent No 4,192,749, 7 p, 3 Fig, 8 Ref; Official Gazette of the United States Patent Office, Vol 992, No 2, p 629, March 11, 1980.

Descriptors: *Patents, *Intakes, *Filters, *Aquatic animals, Preservation, Powerplants, Channels, Intakes structures.

A screen for a water intake has a moveable filter element and a recuperation channel adjacent the filter element arranged below the lowest water level. The concavity of the recuperation channel faces the filter element. Suction is applied at the recuperation channel to cause an opposite circulation of water through the filter element at this point. The recuperation channel acts as a safeguarding device for living elements in the water and the opposite circulation of water at the channel detaches living elements from the filter element without traumatism and urges them into the channel. The channel is provided with a filter spaced from the filter element for preventing living elements being entrained by the filter element and carried to the air. (Sinha - OEIS)

HYDRAULIC LABORATORY TECHNIQUES.
Water and Power Resources Service, Denver, CO. Available from Supt. of Documents, GPO, Washington, DC 20402. A Water Resources Technical Publication, 1980. 228 p, 83 Fig, 3 Tab, 50 Ref.

Descriptors: *Hydraulic models, *Laboratory tests, *Hydraulic engineering, Fluid mechanics, Hydraulic similitude, Spillways, Settling basins, Outlet works, Canals, Rivers, Hydraulic structures, Closed conduit flow, Pumps, Hydraulic turbines, Open channels, Free surfaces.

A guide to applying engineering knowledge to hydraulic studies is presented, based on 50 years of research and testing experience at the Bureau of Reclamation, now renamed the Water and Power Resources Service. Emphasis is placed on basic principles of similitude; techniques of model design, construction, and operation; equipment; and field studies. Individual chapters cover: laboratory equipment; instrumentation; model design; laboratory studies; free-surface flow, spillways, stilling basins, and outlet works; canal structures and river channels; problems of free-surface flow; closed-conduit flow; control of flow; pumps, turbines, and energy absorbers; and field studies. NEW FACILITIES INCREASE CAPACITY, IMPROVE EFFICIENCY,
Louisville Water Co., KY.
F. C. Campbell, and K. W. Cosens.
Journal of the American Water Works Association, Vol 72, No 10, p 558-563, October, 1980. 7 Fig.

Descriptors: *Municipal water, *Treatment facilities, *Construction, Intakes, Conduits, Pumping plants, Costs, Control systems, Remote control, Water treatment, Design, Construction costs.

A study of the water needs for Louisville, Kentucky in 1967 indicated that the building of a second raw water intake and treatment facility would be a better step than continued enlargement of the existing facility. As a consulting engineering firm recommended, the raw water intake and pump station were built to accommodate a 120-mgd flow with no stress, providing space for future pumping capacity up to 200 mgd. The river intake, intake conduits, and raw water pumping station cost $9,939,000. Descriptions and illustrations are given of the intake crib, raw water conduits, and the raw water pump station. Control operations are manually started except for chlorination and screen washing. The control room is situated at the pump station. The plant has been operating for three years with one three-day interruption in service, brought about by the flooding of the mechanical room caused by rupture of a ball valve on the chlorine injection system. The system was redesigned to prevent this problem recurring. The plant should be able to function well beyond the turn of the century before the need for expansion arises. (Baker-FRC)

8G. Materials

SEWER GROUTS AND HOW TO USE THEM.
American City and County, Vol 95, No 1, p 39-41, January, 1980. 1 Fig.

Descriptors: *Grouting, *Sewers, *Infiltration, *Inflow, Pipes, Leakage, Waste water treatment, Treatment facilities, Chemical grouting, Sealants, Safety, Toxicity, Costs, Repairing, Maintenance.

Internal sealing of leaky joints and pipe fractures to prevent infiltration and inflow of unplanned non-sewage flow into sewers may best be achieved through chemical grouts. Grouting of sewer joints has been done in this country for the past 20 yrs. Use of grouting compounds has reduced the cost of sewer repair and maintenance. The two types of sewer grout available, the acrylamide form and an elastomeric urethane prepolymer, are both toxic in their uncured state. When correctly used, both are virtually non-toxic in their cured form. Precuautionary measures to be followed in handling the acrylamide form include the wearing of protective clothing to avoid eye and skin contact and inhalation and the storing of grout in a protected location. Elastomeric grout is flammable, is a mild skin and eye irritant, and should not be inhaled. An insert on the hazards of acrylamide is included. The application of each type is discussed. While the cost per unit is similar for each grout, it has been noted that smaller amounts of the eleastomeric material are needed. A Montgomery County, Ohio sewer rehabilitation project quoted a cost of $5.79/joint sealed with acrylamide grout. Manufacturers of elastomeric grout quote the grouting of an eight-inch joint with the urethane foam at just over $4.00 and claim that acrylamide costs double the Montgomery County price. No grout available today can be used on house laterals. (Baker-FRC)

8I. Fisheries Engineering

ENTRAINMENT OF ICHTHYOPLANKTON BY IRRIGATION WITHDRAWAL SYSTEMS,
Fish and Wildlife Service, Vancouver, WA.
W. R. Nelson, and L. G. Beckman.
Report FWS/OBS-79/16, 1980. 44 p, 5 Fig, 7 Tab, 22 Ref, 2 Append.

Descriptors: *Irrigation engineering, *Reservoirs, *Plankton, *Fry, *Fish eggs, Missouri River, Fish conservation, Entrainment, Intakes, Fish reproduction, Irrigation permits, Bays, Seasonal, Depth, Flow rates.

The use of Missouri River reservoir water for irrigation was generally neglected until the drought of the mid-1970's. Many of the irrigation intakes were installed in shallow areas of embayments where the potential for entraining ichthyoplankton was substantial. This study was designed to: determine the potential for entraining ichthyoplankton by synthesizing the location and number of irrigation structures with knowledge of the reproductive characteristics of Missouri River fishes; develop methodology to sample irrigation pump effluents and determine the extent of ichthyoplankton entrainment; and, evaluate and update the present guidlines for intake system permits. Pumps were operated in Swan Creek embayment to determine the effect of location and depth of intake on entrainment. One system was operated at a shallow site in the upper reaches of the embayment with the intake about 1.5m deep and the other located at a deep site near the embayment mouth with the intake about 5.1 deep. Each pump was operated at flows of 3.4 cu m/min and 5.5 cu m/min weekly during May and June and biweekly during July and August. About 12 times more larval fish and 840 times more fish eggs were entrained at the shallow site than at the deep site. Entrainment of larvel fish was greatest during May and June and decreased to low levels in July and August. Recommendations are made on how entrainment of ichthyoplankton by irrigation systems can be minimized. (Moore - SRC)

OXYGEN TRANSPORT IN SALMON SPAWNING MEDIA,
Alaska Univ., Fairbanks. Inst. of Water Resources.
R. A. Johnson, and R. F. Carlson.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-142119, Price codes: A02 in paper copy, A01 in microfiche. Project Completion Report No 77-7, September, 1980. 9 p, 3 Fig, 1 Tab, 8 Ref. OWRT-B-039-ALAS(2), 14-34-0001-8057.

Descriptors: *Fish eggs, *Fish hatcheries, Fish populations, *Salmon, *Spawning, Fish, Aquatic animals, Aquatic life, Commercial fish, Marine fish, Marine animals, Fish handling facilities, Fish management, Fish reproduction, Research and Development, *Oxygen demand, Oxygen requirements, Design, Engineering, Life cycles.

Transport of sufficient oxygen to the salmon egg capsule to sustain its metabolic growth is critical to fish egg survival. In this study, measurements were confined to collecting data relating to interstitial flows, which related to both hydraulic head loss and dispersive effects in media comprised of either plastic saddles or gravel. Pressure loss data provided a basis for testing the accuracy of the Ergun equation, needed as part of the oxygen-transport predictive model. It was concluded that the Ergun equation could be used to correlate head loss with apparent velocity. A key conclusion was that head loss for the saddles was much less than for the gravels at a given flow rate. That dispersion coefficients for the river gravels were about three-fold greater than for plastic saddles at a given approach velocity, indicated the former have higher mixing efficiencies. Mixing efficiency appeared to peak at intermediate flow velocities for the river gravel, suggesting an optimal regime for mixing. The observations can be used in hatchery design to assist decision for the use of gravels or saddles as incubation media, and for proper flow velocities. (Zielinski-IPA)

10. SCIENTIFIC AND TECHNICAL INFORMATION

10B. Reference and Retrieval

GUIDE TO THE NATIONAL POWER PLANT TEAM'S BIBLIOGRAPHIC DATA BASE,
National Power Plant Team, Ann Arbor, MI.
H. A. Handwerger, and K. A. Gilden.
Report FWS/OBS-80/06, March 1980. 50 p, 2 Append.

Descriptors: *Data collections, *Electric powerplants, *Environmental effects, Libraries, Water resources, Indexing, Wildlife, Construction, Data storage and retrieval.

Today the need for an ever-increasing supply of energy is coupled wih a concern for the protection of the environment and it is imperative that decision-makers and concerned citizens be aware of the costs and benefits of electric power generation. The National Power Plant Team (NPPT) has a library and a bibliographic data base which provide current information on these issues. This guide to the data base facilitates the transfer of information to those who need it, and describes the procedures for accessing the NPPT computerized library. A list of terms used in subject indexing is provided. Subjects covered by the data base include: power plants in general, their effect on the environment, construction and operation, advanced fuels and materials, and power resources. The library has in excess of 1,000 volumes dealing with the impacts of steam electric power plants on aquatic resources. (Moore - SRC)

10C. Secondary Publication And Distribution

A BIBLIOGRAPHY OF STREAM ALTERATION (CHANNELIZATION),

Clemson Univ., SC. Dept. of Entomology and Economic Zoology.
T. R. White, and R. C. Fox.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-131120, Price codes: A04 in paper copy, A01 in microfiche. Water Resources Research Institute, Clemson University, Technical Report No 87, Volume II, May, 1980. 57 p, 836 Ref. OWRT-A-037-SC(1), 14-34-0001-9043, 14-34-0001-8043.

Descriptors: *Bibliographies, *Reviews, *Streamflow, *Alteration of flow, Channel flow, Aquatic environment, Stream stabilization, Documentation, Information retrieval, Channel improvement, Streams, Publications, Research and Development, Streamflow forecasting, Routing, Flow, Stream improvement, Channel erosion, Channel morphology, Distribution patterns, Channelization.

The detrimental effects of stream channelization were increasingly realized by environmentalists and the general public in the past two decades. Evaluation of these effects with respect to all flora and fauna is required to determine how best to preserve our streams and maintain them as important food chain producers. Research results on stream alteration have been most commonly published as government or other public agency reports, which has made papers difficult to find and has led to uncertainty concerning the actual research accomplished on stream alteration. This bibliography, covering over 800 references, was developed to address this research information need. The citations are arranged alphabetically by author, and not grouped by physical or geographical classifications. (Zielinski-IPA)

AQUATIC ANIMALS
Screens for Water Intakes,
W81-00520 8A

Effect of Mild Tannery Pollution on Growth and Emergence of Two Aquatic Insects Rhithrogena Semicolorata and Emphemerella Ignita,
W81-00741 5C

AQUATIC BACTERIA
Concordance of Heavy Metal and Antibiotic Resistance on Plasmids of Chesapeake Bay Bacteria,
W81-00508 5C

Comparison of the Toxicity Thresholds of Water Pollutants to Bacteria, Algae, and Protozoa in the Cell Multiplication Inhibition Test,
W81-00628 5A

AQUATIC PLANTS
Responses of Submersed Vascular Plant Communities to Environmental Change: Summary, W81-00556 5C

AQUATIC WEED CONTROL
Terrestrial-Aquatic Linkages, Component Interactions and Potential Restriction of Growth of the Introduced Aquatic Weed Myriophyllum Spicatum L. (Water Milfoil) I, W81-00687 2H

AQUATIC WEEDS
Terrestrial-Aquatic Linkages, Component Interactions and Potential Restriction of Growth of the Introduced Aquatic Weed Myriophyllum Spicatum L. (Water Milfoil) I, W81-00687 2H

AQUIFER CHARACTERISTICS
Aquifer Tests of the Navajo Sandstone Near Caineville, Wayne County, Utah, W81-00657 2F

AQUIFER TESTING
Aquifer Tests of the Navajo Sandstone Near Caineville, Wayne County, Utah, W81-00657 2F

AQUIFERS
Results of Computer Modeling of Groundwater Flow - The Calcium Carbonate Aquifer of the Central Roswell Basin, W81-00642 2F

Structure Contour Map of the Madison Group, Havre 1 Degree by 2 Degree Quadrangle, North-Central Montana, W81-00652 7C

Structure Contour Map of the Top of the Madison Group, Great Falls 1 Degree by 2 Degree Quadrangle, North-Central Montana, W81-00653 7C

Structure Contour Map of the Top of the Madison Group, Shelby 1 Degree by 2 Degree Quadrangle, North-Central Montana, W81-00654 7C

Structure Contour Map of the Top of the Madison Group, Lewistown 1 Degree by 2 Degree Quadrangle, North-Central Montana, W81-00655 7C

Records of Ground-Water Recharge and Discharge, 1934-78; Water Levels, 1975-78; and Chemical Quality of Water, 1977-78, for the Edwards Aquifer in the San Antonio Area, Texas. W81-00668 2F

ARABLE LAND
The Survival of Salmonellae in Sewage Sludge Applied to Arable Land, W81-00572 5E

ARKANSAS
An Analysis of Residential Water Demand Schedules in Arkansas, W81-00690 6D

A Five Year Water Research Plan for the State of Arkansas, W81-00693 6E

ARKANSAS RIVER BASIN (CO)
Water Resources Data for Colorado, Water Year 1979--Volume 1. Missouri River Basin, Akansas River Basin, and Rio Grande Basin. W81-00669 7C

ARSENIC
The Estimation of Arsenic Concentrations in Sewage Sludges from the Lothian Region, W81-00621 5A

ASSAY
Condensed Report on the Use of Enzymatic Cycling for High Specificity and Precision in the Colorimetric Analysis of Ammonia, W81-00698 5A

ATOMIC ABSORPTION SPECTROPHOTOMETRY
The Estimation of Arsenic Concentrations in Sewage Sludges from the Lothian Region, W81-00621 5A

AUTOMATION
Automated Distillation-Spectophotometry Procedure for Determining ammonia in Water, W81-00576 5A

Blanking System for the Spectrophotometric Determination of Ammonia in Surface Waters, W81-00598 5A

BACTERIA
Endotoxins, Algae and Limulus Amoebocyte Lysate Test in Drinking Water, W81-00740 5F

BANK STABILIZATION
Effects of Bank Stabilization on the Physical and Chemical Characteristics of Streams and Small Rivers: an Annotated Bibliography, W81-00557 4D

Effects of Bank Stabilization on the Physical and Chemical Characteristics of Streams and Small Rivers: A Synthesis, W81-00559 4D

BARD VALLEY (CA)
Dissolved-Solids Concentrations and Loads in Return Flows to the Colorado River from Agricultural Land in Southern California, W81-00664 5B

BASE FLOW
A Baseflow Simulation Model, W81-00516 2E

Predicting Normal Mimimum-Flow Rates for Ungaged Streams in West Virginia, W81-00685 2E

BATHYMETRY
Bathymetric Studies on the Pongolo River Flood Plain, W81-00734 2D

BAYS
Water Quality of Tampa Bay, Florida: June 1972 - May 1976, W81-00662 5A

BENEFICIAL USE
Planning Report for the Irrigation Portion of a Dual Water System for West Jordan City, Salt Lake County, Utah, W81-00649 3C

BENTHIC FAUNA
Effects of Urban Runoff and Treated Municipal Wastewater on a Man-Made Channel in Northeastern Illinois, W81-00626 5C

BENTHOS
Preliminary Observations on the Benthic Macroinvertebrate Communities of Ross Bay, a Polluted Area of Lough Leane, South-West Ireland, W81-00634 5C

The Evolution of Thallus Form and Survival Strategies in Benthic Marine Macroalgae: Field and Laboratory Tests of a Functional Form Model, W81-00706 5C

BIBLIOGRAPHIES
Effects of Bank Stabilization on the Physical and Chemical Characteristics of Streams and Small Rivers: an Annotated Bibliography, W81-00557 4D

BIBLOGRAPHIES
A Bibliography of Stream Alteration (Channelization), W81-00546 10C

BIOASSAY
Concordance of Heavy Metal and Antibiotic Resistance on Plasmids of Chesapeake Bay Bacteria, W81-00508 5C

The Use of Hydrobia Jenkinsi to Detect Intermittent Toxic Discharges to a River, W81-00745 5A

BIODEGRADATION
Biodegradability Determinations in Trickling Filter Units Compared With the OECD Confirmatory Test, W81-00735 5D

Evaluation of Ozone Induced Biodegradability of Wastewater Treatment Plant Effluent, W81-00746 5D

BIOINDICATORS
Interlaboratory Comparison of Determinations of Trace Level Hydrocarbons in Mussels, W81-00602 5A

Comparison of the Toxicity Thresholds of Water Pollutants to Bacteria, Algae, and Protozoa in the Cell Multiplication Inhibition Test, W81-00628 5A

The Use of Hydrobia Jenkinsi to Detect Intermittent Toxic Discharges to a River, W81-00745 5A

BIOLOGICAL COMMUNITIES
The Evolution of Thallus Form and Survival Strategies in Benthic Marine Macroalgae: Field and Laboratory Tests of a Functional Form Model, W81-00706 5C

BIOLOGICAL PROPERTIES
A Limnological Investigation of Lake Liambezi, Caprivi, W81-00551 2H

BIOLOGICAL TREATMENT
Process and Apparatus for the Biological Treatment of Waste Water, W81-00529 5D

Oily Effluent Treatment by the BP Treatment Process, W81-00581 5D

Fluidized- and Expanded-Bed Reactors for Waste-Water Treatment, W81-00584 5D

Design of Biological Filtration Plants, W81-00616 5F

Microbial Viability Measurements and Activated Sludge Kinetics, W81-00627 5D

The Effect of Dissolved Oxygen Concentration on Nitrification, W81-00729 5D

BLEACHING WASTES
Detoxification of Kraft Pulpmill Effluents by Foam Separation. W81-00597 5D

BOREHOLE GEOPHYSICS
Determination of Water Saturation in Subsurface Earth Formations Adjacent Well Boreholes,
W81-00536 4B

BOSTON HARBOR (MA)
Anthropogenic Influence of the Sedimentary Regime of an Urban Estuary - Boston Harbor,
W81-00519 2L

CADMIUM
Primary Flocculation of Cadmium Plating Plant Effluent: Improved Occupational Hygiene and Effluent Quality,
W81-00614 5D

CALCIUM CARBONATE
Results of Computer Modeling of Groundwater Flow - The Calcium Carbonate Aquifer of the Central Roswell Basin,
W81-00642 2F

CALIFORNIA
Agricultural Water Use and Costs in California,
W81-00644 3F

The Effect of San Francisco's Wastewater Plan on Water Quality and Aquatic Biology,
W81-00647 5F

Reclamation Law, Water Districts, and Politics in the Kings River Service Area of California - An Alternative Framework for Analysis,
W81-00650 6E

Dissolved-Solids Concentrations and Loads in Return Flows to the Colorado River from Agricultural Land in Southern California,
W81-00664 5B

CANADA
Seventh Annual Report: Great Lakes Water Quality.
W81-00702 5D

Status Report on Abatement of Water Pollution From the Canadian Pulp and Paper Industry (1978).
W81-00703 5G

Mercury Concentrations in Fish Inhabiting Two Polluted Lakes in Northern Canada,
W81-00742 5B

CANCER
Drinking Water Chlorination: A Practice Unrelated to Cancer Mortality,
W81-00592 5F

CARBONATE ROCKS
Enviromental Controls on Occurrence and Chemistry of Groundwater in a Carbonate Terrane of Eastern Nevada,
W81-00637 2F

CHANNEL FLOW
Measurement of Water Flow Rate,
W81-00714 2E

CHANNELS
Effects of Urban Runoff and Treated Municipal Wastewater on a Man-Made Channel in Northeastern Illinois,
W81-00626 5C

CHEMICAL ANALYSIS
The Estimation of Arsenic Concentrations in Sewage Sludges from the Lothian Region,
W81-00621 5A

Reconnaissance of Chemical Quality of Surface Water and Fluvial Sediment in the Dirty Devil River Basin, Utah,
W81-00659 2K

CHEMICAL OXYGEN DEMAND
Determination of Chemical Oxygen Demand Using an Open-Tube Method,
W81-00571 7B

CHEMICAL PRECIPITATION
In-Ground Precipitation Ends Wellscreen Plugging,
W81-00588 5G

CHEMICAL PROPERTIES
A Limnological Investigation of Lake Liambezi, Caprivi,
W81-00551 2H

Water Quality of Tampa Bay, Florida: June 1972 - May 1976,
W81-00662 5A

CHEMICAL REACTIONS
Improved Method Generates More Chlorine Dioxide,
W81-00610 5F

CHESAPEAKE BAY
Concordance of Heavy Metal and Antibiotic Resistance on Plasmids of Chesapeake Bay Bacteria,
W81-00508 5C

CHLORINATED HYDROCARBON PESTICIDES
Rapid Assays for Microbial Degradation of 2-Chlorophenol,
W81-00697 5D

CHLORINATED PARAFFINS
Chlorinated Paraffins and the Environment. 1. Environmental Occurrence,
W81-00577 5B

Chlorinated Paraffins and the Environment. 2. Aquatic and Avian Toxicology,
W81-00578 5C

CHLORINATION
The Effects of Permanganate Pretreatment on Trihalomethane Formation in Drinking Water,
W81-00570 5F

Drinking Water Chlorination: A Practice Unrelated to Cancer Mortality,
W81-00592 5F

An Empirical Kinetic Model of Trihalomethane Formation: Applications to Meet the Proposed THM Standard,
W81-00596 5F

Gas Chromatographic-Mass Spectrometric Analysis of Chlorination Effects on Commercial Coal-Tar Leachate,
W81-00603 7B

Improved Method Generates More Chlorine Dioxide,
W81-00610 5F

The Development of Chlorine Resistant Ultrathin Film Composite Membranes from Soluble Aromatic Polyimide Thin Films on Polybutylene Terephthalate Supports,
W81-00679 5D

The Mutagenic Activity in a Section of the Sheep River, Alberta Receiving a Chlorinated Sewage Effluent,
W81-00737 5B

CHLOROPHYTA
Endotoxins, Algae and Limulus Amoebocyte Lysate Test in Drinking Water,
W81-00740 5F

CITIES
Institutional Problems of Water Quality Planning (Section 208) in Urbanizing Areas,
W81-00672 6E

CLADOPHORA
Eutrophication in Peel Inlet-I. The Problem-Defining Behavior and a Mathematical Model for the Phosphorus Scenario,
W81-00725 5A

Eutrophication in Peel Inlet-II. Identification of Critical Uncertainties Via Generalized Sensitivity Analysis,
W81-00726 5B

CLAY MINERALS
Reductions in Inactivation Rates of Bacteriophages by Clay Minerals in Lake Water,
W81-00636 5G

COAGULATION
The Clarification of Effluent from an Activated-Sludge Plant Using Dissolved-Air Flotation,
W81-00587 5D

Optimizing Water Treatment Plant Operations for Savings of Water, Energy, and Chemicals,
W81-00686 5F

COAL MINE WASTES
Growth Responses of Selected Freshwater Algae to Trace Elements and Scrubber Ash Slurry Generated by Coal-Fired Power Plants,
W81-00629 5C

COAL MINES
Management of the Hydrologic System in Areas Subject to Coal Mining Activities,
W81-00502 5G

Promising Methodologies for Fish and Wildlife Planning and Impact Assessments,
W81-00565 6G

Water as a Parameter for Development of Energy Resources in the Upper Great Plains -- Effects on Land and Water Resources of Alternative Patterns of Coal-Based Energy Development,
W81-00691 6B

Water as a Parameter for Development of Energy Resources in the Upper Great Plains -- Socioeconomic Effects of Alternative Patterns of Coal-Based Energy Development,
W81-00692 6B

COAL TAR COATINGS
Gas Chromatographic-Mass Spectrometric Analysis of Chlorination Effects on Commercial Coal-Tar Leachate,
W81-00603 7B

COALS
Water Quality Aspects of Coal Transportation by Slurry Pipeline,
W81-00673 5B

COASTS
Development and Application of a Field Instrumentation System for the Investigation of Surf Zone Hydrodynamics,
W81-00518 2J

COLIFORMS
Agricultural Area Impacts within a Natural Area: Cades Cove, a Case History,
W81-00612 5C

COLOR
Method of Lowering the Color of Effluent Which Contains Aryl Azo- or Arly Nitro-Containing Compounds,
W81-00712 5D

COLOR REMOVAL
UV-ozone and UV-oxygen Processes for Color Removal from Textile Dyeing and Finishing Wastewaters,
W81-00503 5D

COLORADO
A Watershed Information System,
W81-00506 7B

Water Resources Data for Colorado, Water Year 1979--Volume 1. Missouri River Basin, Akansas River Basin, and Rio Grande Basin.
W81-00669 7C

Water Resources Data for Colorado, Water Year 1979--Volume 2. Colorado River Basin above Dolores River.
W81-00670 7C

Water Resources Data for Colorado, Water Year 1979--Volume 3. Dolores River Basin, Green River Basin, and San Juan River Basin.
W81-00671 7C

COLORADO RIVER
Dissolved-Solids Concentrations and Loads in Return Flows to the Colorado River from Agricultural Land in Southern California,
W81-00664 5B

COLORADO RIVER BASIN (CO)
Water Resources Data for Colorado, Water Year 1979--Volume 2. Colorado River Basin above Dolores River.
W81-00670 7C

COLORIMETRY
An Automated Method for the Simultaneous Determination of Nitrogen and Phosphorus in Plant Material, Sludge and Soil,
W81-00622 7B

COLUMBIA RIVER
243,244-Cm in Columbia River Sediments,
W81-00611 5B

COMPREHENSIVE PLANNING
Planning Report for the Irrigation Portion of a Dual Water System for West Jordan City, Salt Lake County, Utah,
W81-00649 3C

Explorations in Multiobjective Water Resource History,
W81-00674 6B

COMPUTER MODELS
Water as a Parameter for Development of Energy Resources in the Upper Great Plains -- Socioeconomic Effects of Alternative Patterns of Coal-Based Energy Development,
W81-00692 6B

COMPUTER PROGRAMS
A Laboratory Data-Processing System,
W81-00575 7C

CONNECTICUT
RVRFLO: A Hydraulic Simulator of Water Quality in the Housatonic River in Connecticut,
W81-00651 5B

Five Year Plan of Water Resources Research and Development for Connecticut,
W81-00675 6E

CONSTRUCTION
New Facilities Increase Capacity, Improve Efficiency,
W81-00594 8A

CONTINENTAL SHELF
Environmental Assessment of the Alaskan Continental Shelf: Kodiak Interim Synthesis Report -- 1980.
W81-00512 5C

CONTROL SYSTEMS
Phosphorus Management for the Great Lakes.
W81-00511 5G

Irrigation Pipe Control System,
W81-00539 3F

Automatic Control of the Moisture Content of the Soil,
W81-00708 3F

COPPER
The Effects of Hardness, Alkalinity and PH of Test Water on the Toxicity of Copper to Rainbow Trout (Salmo Gairdneri),
W81-00633 5C

CORES
243,244-Cm in Columbia River Sediments,
W81-00611 5B

COST ANALYSIS
Water Requirements and Costs for South Dakota Rural Manufacturing Firms,
W81-00550 6B

Least Cost Design of Urban Drainage Systems,
W81-00552 4C

Water as a Parameter for Development of Energy Resources in the Upper Great Plains -- Effects on Land and Water Resources of Alternative Patterns of Coal-Based Energy Development,
W81-00691 6B

Water as a Parameter for Development of Energy Resources in the Upper Great Plains -- Socioeconomic Effects of Alternative Patterns of Coal-Based Energy Development,
W81-00692 6B

CROP PRODUCTION
Field Experiments on Application of Treated Municipal Waste Waters to Vegetated Lands,
W81-00620 3C

CROP PRODUCTION BUDGETS
Agricultural Water Use and Costs in California,
W81-00644 3F

CRYOGENICS
On-Column Cryogenic Trapping of Sorbed Organics for Determination by Capillary Gas Chromatography,
W81-00600 7B

CULTURES
The Stability of Bovine Parvovirus and its Possible Use as an Indicator for the Persistence of Enteric Viruses,
W81-00749 5A

CYCLING NUTRIENTS
In-Situ Evaluation of the Filtering Function of a Piedmont Creek Swamp,
W81-00677 5B

DADE CITY AREA (FL)
Ground-Water Hydrology of the Dade City Area, Pasco County, Florida, with Emphasis on the Hydrologic Effects of Pumping from the Floridan Aquifer,
W81-00661 4B

DAM FAILURE
Evaluation of Selected Dam-Break Flood-Wave Models by Using Field Data,
W81-00666 2E

DAMS
Factors Influencing Viable Bacteria in a Turbid Man-Made Impoundment.
W81-00733 2H

DATA COLLECTIONS
Guide to the National Power Plant Team's Bibliographic Data Base,
W81-00561 10B

Introduction (Special Issue on the Progress of an On-Going Program to Improve Methodologies for the Analysis of Priority Pollutants in Waste Water Effluents),
W81-00609 7B

DATA PROCESSING
A Laboratory Data-Processing System,
W81-00575 7C

DATA STORAGE AND RETRIEVAL
A Laboratory Data-Processing System,
W81-00575 7C

DDT
On the Validity of the Codistillation Model for the Evaporation of Pesticides and Other Solutes From Water Solution,
W81-00604 7B

DECISION MAKING
Multiobjective Analysis in the Maumee River Basin: A Case Study,
W81-00507 6A

DEEP-WELL PUMPING
Ground-Water Hydrology of the Dade City Area, Pasco County, Florida, with Emphasis on the Hydrologic Effects of Pumping from the Floridan Aquifer,
W81-00661 4B

DELAWARE BAY
Holocene Geomorphic Evolution of a Barrier-Salt Marsh System, SW Delaware Bay,
W81-00517 2L

DENITRIFICATION
Experience in Operating the Deep-Shaft Activated Sludge Process,
W81-00583 5D

Fluidized- and Expanded-Bed Reactors for Waste-Water Treatment,
W81-00584 5D

DESALINATION
Pilot Plant Study on Marine Microorganisms and Organic Matter in Seawater Desalination by Reverse Osmosis,
W81-00639 3A

DESALINATION APPARATUS
Gravity Wash Column Design, Procurement, and Installation; Followed by Development Tests of the Modified Single-Stage Desalting Pilot Plant at Wrightsville Beach, North Carolina,
W81-00689 3A

DESALINATION PLANTS
Gravity Wash Column Design, Procurement, and Installation; Followed by Development Tests of the Modified Single-Stage Desalting Pilot Plant at Wrightsville Beach, North Carolina,
W81-00689 3A

DESALINATION PROCESSES
Gravity Wash Column Design, Procurement, and Installation; Followed by Development Tests of the Modified Single-Stage Desalting Pilot Plant at Wrightsville Beach, North Carolina,
W81-00689 3A

DESIGN
Design of Biological Filtration Plants,
W81-00616 5F

A Comparison of Models for Completely Mixed Activated Sludge Treatment Design and Operation,
W81-00730 5D

DESIGN CRITERIA
Least Cost Design of Urban Drainage Systems,
W81-00552 4C

DESIGN DATA
Treatment of Industrial Liquid Wastes by Electroflotation,
W81-00567 5D

DEWATERING
The Dewatering of Activated Sludge: Measurement of Specific Resistance to Filtration and Capillary Suction Time,
W81-00613 5E

DIELDRIN
The Use of Hydrobia Jenkinsi to Detect Intermittent Toxic Discharges to a River,
W81-00745 5A

DIFFUSION
Removal of Trace Metals from Sediments under Chemico-Osmotic Gradients,
W81-00504 5B

DIRTY DEVIL RIVER BASIN (UT)
Aquifer Tests of the Navajo Sandstone Near Caineville, Wayne County, Utah,
W81-00657 2F

Reconnaissance of Chemical Quality of Surface Water and Fluvial Sediment in the Dirty Devil River Basin, Utah,
W81-00659 2K

DISEASES
Cross-Connection Control Means Potable Water Safety.
W81-00589 5G

DISSOLVED OXYGEN
Dynamics of Dissolved Oxygen During Algal Bloom in Lake Kasumigaura, Japan,
W81-00635 2H

The Effect of Dissolved Oxygen Concentration on Nitrification,
W81-00729 5D

Effects of Streambank Materials Additions upon Microbial Activities of Two Sub-Arctic Canadian Rivers,
W81-00750 5C

DISSOLVED SOLIDS
Dissolved-Solids Concentrations and Loads in Return Flows to the Colorado River from Agricultural Land in Southern California,
W81-00664 5B

DISTILLATION
Automated Distillation-Spectophotometry Procedure for Determining ammonia in Water,
W81-00576 5A

On the Validity of the Codistillation Model for the Evaporation of Pesticides and Other Solutes From Water Solution,
W81-00604 7B

DOLORES RIVER BASIN (CO)
Water Resources Data for Colorado, Water Year 1979--Volume 3. Dolores River Basin, Green River Basin, and San Juan River Basin.
W81-00671 7C

DOMESTIC WASTES
Sewage Disposal in Developing Countries: Some Throughts,
W81-00574 5D

Pseudomonas Aeruginosa and Escherichia Coli in Sewage and Fresh Water,
W81-00736 5B

DRAINAGE SYSTEMS
Least Cost Design of Urban Drainage Systems,
W81-00552 4C

DRAWDOWN
Ground-Water Hydrology of the Dade City Area, Pasco County, Florida, with Emphasis on the Hydrologic Effects of Pumping from the Floridan Aquifer,
W81-00661 4B

DRIP IRRIGATION
Three Layer Irrigation Tube and Apparatus and Method for Producing Same,
W81-00717 3F

DRYING
Enhanced Solar Drying of Wastewater Sludge,
W81-00682 5D

DYES
UV-ozone and UV-oxygen Processes for Color Removal from Textile Dyeing and Finishing Wastewaters,
W81-00503 5D

E. COLI
Pseudomonas Aeruginosa and Escherichia Coli in Sewage and Fresh Water,
W81-00736 5B

ECOLOGY
The Evolution of Thallus Form and Survival Strategies in Benthic Marine Macroalgae: Field and Laboratory Tests of a Functional Form Model,
W81-00706 5C

ECONOMIC EFFICIENCY
Efficient Government Institution for Water Quality Control,
W81-00648 6E

ECONOMIC FEASIBILITY
Planning Report for the Irrigation Portion of a Dual Water System for West Jordan City, Salt Lake County, Utah,
W81-00649 3C

ECONOMIC IMPACT
The Future of Agricultural Water Use in New Mexico,
W81-00643 6D

ECOSYSTEMS
Ecological Comparison of Intermittent Streams in Different Land Use Patterns in Northeastern Illinois,
W81-00645 2E

EDWARDS AQUIFER (TX)
Records of Ground-Water Recharge and Discharge, 1934-78; Water Levels, 1975-78; and Chemical Quality of Water, 1977-78, for the Edwards Aquifer in the San Antonio Area, Texas.
W81-00668 2F

EFFICIENCIES
Investigation of Factors Affecting Energy for Irrigation Pumping,
W81-00509 3F

ELASTICITY OF DEMAND
An Analysis of Residential Water Demand Schedules in Arkansas,
W81-00690 6D

ELECTRIC POWERPLANTS
Guide to the National Power Plant Team's Bibliographic Data Base,
W81-00561 10B

ELECTRICAL DESIGN
Treatment of Industrial Liquid Wastes by Electroflotation,
W81-00567 5D

ELECTRODES
Selective Multiple Electrode Waste Water Treating System,
W81-00532 5D

ENERGY
Environmental Assessment of the Alaskan Continental Shelf: Kodiak Interim Synthesis Report -- 1980.
W81-00512 5C

ENERGY LOSS
Investigation of Factors Affecting Energy for Irrigation Pumping,
W81-00509 3F

ENGLAND
The Use of Hydrobia Jenkinsi to Detect Intermittent Toxic Discharges to a River,
W81-00745 5A

ENVIRONMENTAL ASSESSMENT
Environmental Assessments in Water Resources Planning,
W81-00704 6B

ENVIRONMENTAL EFFECTS
Environmental Assessment of the Alaskan Continental Shelf: Kodiak Interim Synthesis Report -- 1980.

Use of the Deep-Shaft-Process in Upgrading and Extending Existing Sewage-Treatment Works,
W81-00608 5D

The Dewatering of Activated Sludge: Measurement of Specific Resistance to Filtration and Capillary Suction Time,
W81-00613 5E

Development of Chlorine Resistant Membrane, Asymmetric Polyimide Membrane and Porous Substrates,
W81-00681 5G

Feasibility of Purification and Concentration of Selected Wastewater Streams by Ultrafiltration,
W81-00701 5D

Pleated Filter Underdrain, Method and Apparatus,
W81-00721 5G

FISH
Impacts of Uranium Mining and Milling Upon the Fish and Wildlife Resources of the New Mexico San Juan Basin Region,
W81-00555 5C

Strategy for Assessing Impacts of Power Plants on Fish and Shellfish Populations,
W81-00563 6B

Mercury Concentrations in Fish Inhabiting Two Polluted Lakes in Northern Canada,
W81-00742 5B

Sensory Properties and Analysis of Two Muddy Odour Compounds, Geosmin and 2-Methylisoborneol, in Water and Fish,
W81-00748 5A

FISH EGGS
Entrainment of Ichthyoplankton by Irrigation Withdrawal Systems,
W81-00560 8I

Oxygen Transport in Salmon Spawning Media,
W81-00676 8I

FISH FARMING
Factors Influencing Viable Bacteria in a Turbid Man-Made Impoundment.
W81-00733 2H

Bathymetric Studies on the Pongolo River Flood Plain,
W81-00734 2D

FISH HATCHERIES
Oxygen Transport in Salmon Spawning Media,
W81-00676 8I

FISH MANAGEMENT
A Limnological Investigation of Lake Liambezi, Caprivi,
W81-00551 2H

FISH PHYSIOLOGY
Potential Impacts of Low pH on Fish and Fish Populations,
W81-00564 5C

FISHKILL
Aluminum Pollution and Fish Toxicity,
W81-00619 5C

FIVE-YEAR PLANS
Regional Five-Year Research and Development Plan for Period 1982-1987. Pacific Northwest/ Oceania Region.
W81-00547 6E

Water Resources Research Needs in New England,
W81-00548 6E

Five Year Plan of Water Resources Research and Development for Connecticut,
W81-00675 6E

Five-Year Research Plan,
W81-00683 6E

1982-1986 Research and Development Plan for Florida Water Resources Research Center,
W81-00684 6E

A Five Year Water Research Plan for the State of Arkansas,
W81-00693 6E

Five-Year Water Resources Research and Development Plan: Fiscal Years 1982-1986.
W81-00694 6E

Regional Five-Year Water Research and Development Goals and Objectives.
W81-00699 6E

Water Resources Research Program: Five-Year Projection (1982-1986), Pennsylvania Water Resources Research Center,
W81-00700 6E

FLOCCULATION
Selective Multiple Electrode Waste Water Treating System,
W81-00532 5D

Ferrite Flocculating System,
W81-00533 5D

Primary Flocculation of Cadmium Plating Plant Effluent: Improved Occupational Hygiene and Effluent Quality,
W81-00614 5D

FLOOD FREQUENCY
Flood Magnitude and Frequency of Streams in Indiana: Preliminary Estimating Equations,
W81-00667 2E

FLOOD PLAINS
Bathymetric Studies on the Pongolo River Flood Plain,
W81-00734 2D

FLOODS
Evaluation of Selected Dam-Break Flood-Wave Models by Using Field Data,
W81-00666 2E

Flood Magnitude and Frequency of Streams in Indiana: Preliminary Estimating Equations,
W81-00667 2E

FLORIDA
Ground-Water Hydrology of the Dade City Area, Pasco County, Florida, with Emphasis on the Hydrologic Effects of Pumping from the Floridan Aquifer,
W81-00661 4B

Water Quality of Tampa Bay, Florida: June 1972 - May 1976,
W81-00662 5A

1982-1986 Research and Development Plan for Florida Water Resources Research Center,
W81-00684 6E

FLORIDAN AQUIFER
Ground-Water Hydrology of the Dade City Area, Pasco County, Florida, with Emphasis on the Hydrologic Effects of Pumping from the Floridan Aquifer,
W81-00661 4B

FLOTATION
Treatment of Industrial Liquid Wastes by Electroflotation,
W81-00567 5D

The Clarification of Effluent from an Activated-Sludge Plant Using Dissolved-Air Flotation,
W81-00587 5D

Effluent Treatment and Algae Recovery by Ozone-Induced Flotation,
W81-00744 5D

FLOW CHARACTERISTICS
Low-Flow Characteristics of Louisiana Streams,
W81-00665 2E

FLOW MEASUREMENT
Measurement of Water Flow Rate,
W81-00714 2E

FLOW RESISTANCE
The Dewatering of Activated Sludge: Measurement of Specific Resistance to Filtration and Capillary Suction Time,
W81-00613 5E

FLUVIAL SEDIMENTS
Reconnaissance of Chemical Quality of Surface Water and Fluvial Sediment in the Dirty Devil River Basin, Utah,
W81-00659 2K

FOAM FRACTIONATION
Detoxification of Kraft Pulpmill Effluents by Foam Separation.
W81-00597 5D

FOOD PROCESSING INDUSTRY
Recovery of Protein and Fat From Food Industry Waste Waters,
W81-00580 5D

FORECASTING
An Analysis of Residential Water Demand Schedules in Arkansas,
W81-00690 6D

FORT MOJAVE AREA (CA)
Dissolved-Solids Concentrations and Loads in Return Flows to the Colorado River from Agricultural Land in Southern California,
W81-00664 5B

FOULING
Pilot Plant Study on Marine Microorganisms and Organic Matter in Seawater Desalination by Reverse Osmosis,
W81-00639 3A

FRESHWATER
Creating and Maintaining a Pool of Fresh Water on a Tabular Iceberg,
W81-00537 3B

Freshwater Use Customs on Rota: An Exploratory Study.
W81-00640 7C

FRY
Entrainment of Ichthyoplankton by Irrigation Withdrawal Systems,
W81-00560 8I

FULVIC ACIDS
Characterization and Activated Carbon Adsorption of Several Humic Substances,
W81-00630 5F

GAS CHROMATOGRAPHY
Base Peak Profiles of Gas Chromatography-Mass Spectrometric Data Obtained From Thermal Desorption of Activated Carbons,
W81-00569 7B

On-Column Cryogenic Trapping of Sorbed Organics for Determination by Capillary Gas Chromatography,
W81-00600 7B

Determination of Alpha-Chloroacetanilides in Water by Gas Chromatography and Infrared Spectrometry,
W81-00601 7B

GC/MS Identification of Trace Organics in Philadelphia Drinking Waters During a 2-Year Period,
W81-00623 5A

GASTROPODS
The Use of Hydrobia Jenkinsi to Detect Intermittent Toxic Discharges to a River,
W81-00745 5A

GEOCHEMISTRY
Enviromental Controls on Occurrence and Chemistry of Groundwater in a Carbonate Terrane of Eastern Nevada,
W81-00637 2F

GEOHYDROLOGIC UNITS
Structure Contour Map of the Madison Group, Havre 1 Degree by 2 Degree Quadrangle, North-Central Montana,
W81-00652 7C

Structure Contour Map of the Top of the Madison Group, Great Falls 1 Degree by 2 Degree Quadrangle, North-Central Montana,
W81-00653 7C

Structure Contour Map of the Top of the Madison Group, Shelby 1 Degree by 2 Degree Quadrangle, North-Central Montana,
W81-00654 7C

Structure Contour Map of the Top of the Madison Group, Lewistown 1 Degree by 2 Degree Quadrangle, North-Central Montana,
W81-00655 7C

Aquifer Tests of the Navajo Sandstone Near Caineville, Wayne County, Utah,
W81-00657 2F

GEOMORPHOLOGY
Holocene Geomorphic Evolution of a Barrier-Salt Marsh System, SW Delaware Bay,
W81-00517 2L

GOVERNMENT INTERRELATIONS
Efficient Government Institution for Water Quality Control,
W81-00648 6E

Reclamation Law, Water Districts, and Politics in the Kings River Service Area of California - An Alternative Framework for Analysis,
W81-00650 6E

GREAT BASIN
Basin Development and Water Allocation,
W81-00514 6A

GREAT FALLS QUADRANGLE
Structure Contour Map of the Top of the Madison Group, Great Falls 1 Degree by 2 Degree Quadrangle, North-Central Montana,
W81-00653 7C

GREAT LAKES
Phosphorus Management for the Great Lakes.
W81-00511 5G

Seventh Annual Report: Great Lakes Water Quality.
W81-00702 5D

GREAT PLAINS
Water as a Parameter for Development of Energy Resources in the Upper Great Plains -- Effects on Land and Water Resources of Alternative Patterns of Coal-Based Energy Development,
W81-00691 6B

Water as a Parameter for Development of Energy Resources in the Upper Great Plains -- Socioeconomic Effects of Alternative Patterns of Coal-Based Energy Development,
W81-00692 6B

GREAT SALT LAKE
Estimated Inflow and Evaporation for Great Salt Lake, Utah, 1931-76, with Revised Model for Evaluating the Effects of Dikes on the Water and Salt Balance of the Lake,
W81-00658 2H

GREEN RIVER BASIN (CO)
Water Resources Data for Colorado, Water Year 1979--Volume 3. Dolores River Basin, Green River Basin, and San Juan River Basin.
W81-00671 7C

GROUNDWATER
Reasonable Ground Water Pumping Levels Under the Appropriation Doctrine: Law, Policy and Alternatives,
W81-00510 6E

Water Resources Data for Massachusetts and Rhode Island, Water Year 1979.
W81-00656 7C

Ground-Water Hydrology of the Dade City Area, Pasco County, Florida, with Emphasis on the Hydrologic Effects of Pumping from the Floridan Aquifer,
W81-00661 4B

Water Resources Data for Colorado, Water Year 1979--Volume 1. Missouri River Basin, Akansas River Basin, and Rio Grande Basin.
W81-00669 7C

Water Resources Data for Colorado, Water Year 1979--Volume 2. Colorado River Basin above Dolores River.
W81-00670 7C

Water Resources Data for Colorado, Water Year 1979--Volume 3. Dolores River Basin, Green River Basin, and San Juan River Basin.
W81-00671 7C

GROUNDWATER MOVEMENT
Enviromental Controls on Occurrence and Chemistry of Groundwater in a Carbonate Terrane of Eastern Nevada,
W81-00637 2F

Results of Computer Modeling of Groundwater Flow - The Calcium Carbonate Aquifer of the Central Roswell Basin,
W81-00642 2F

GROUNDWATER RECHARGE
Records of Ground-Water Recharge and Discharge, 1934-78; Water Levels, 1975-78; and Chemical Quality of Water, 1977-78, for the Edwards Aquifer in the San Antonio Area, Texas.
W81-00668 2F

GROUNDWATER SOURCES
Enviromental Controls on Occurrence and Chemistry of Groundwater in a Carbonate Terrane of Eastern Nevada,
W81-00637 2F

GROUTING
Sewer Grouts and How to Use Them.
W81-00728 8G

GUAM
Regional Five-Year Research and Development Plan for Period 1982-1987. Pacific Northwest/Oceania Region.
W81-00547 6E

HALOCENE
Holocene Geomorphic Evolution of a Barrier-Salt Marsh System, SW Delaware Bay,
W81-00517 2L

HARDNESS (WATER)
The Effects of Hardness, Alkalinity and PH of Test Water on the Toxicity of Copper to Rainbow Trout (Salmo Gairdneri),
W81-00633 5C

HAVRE QUADRANGLE
Structure Contour Map of the Madison Group, Havre 1 Degree by 2 Degree Quadrangle, North-Central Montana,
W81-00652 7C

HAWAII
Regional Five-Year Research and Development Plan for Period 1982-1987. Pacific Northwest/ Oceania Region.
W81-00547 6E

HEAVY METALS
Concordance of Heavy Metal and Antibiotic Resistance on Plasmids of Chesapeake Bay Bacteria,
W81-00508 5C

Exchange of Comments on Scheme for Classification of Heavy Metal Species in Natural Waters,
W81-00599 5A

The Use of Hydrobia Jenkinsi to Detect Intermittent Toxic Discharges to a River,
W81-00745 5A

An Ecological Risk Index for Aquatic Pollution Control. A Sedimentological Approach,
W81-00747 5C

HISTORY
Freshwater Use Customs on Rota: An Exploratory Study.
W81-00640 7C

HOUSATONIC RIVER (CT)
RVRFLO: A Hydraulic Simulator of Water Quality in the Housatonic River in Connecticut,
W81-00651 5B

HUMIC ACIDS
Characterization and Activated Carbon Adsorption of Several Humic Substances,
W81-00630 5F

HYDRAULIC ENGINEERING
Hydraulic Laboratory Techniques.
W81-00566 8A

HYDRAULIC MODELS
Hydraulic Laboratory Techniques.
W81-00566 8A

HYDRAULIC SIMILITUDE
RVRFLO: A Hydraulic Simulator of Water Quality in the Housatonic River in Connecticut,
W81-00651 5B

HYDRAULIC SYSTEMS
Argicultural Irrigation System and Components Therefor,
W81-00542 3F

HYDRAULIC TRANSPORTATION
Water Quality Aspects of Coal Transportation by Slurry Pipeline,
W81-00673 5B

HYDRODYNAMICS
Development and Application of a Field Instrumentation System for the Investigation of Surf Zone Hydrodynamics,
W81-00518 2J

HYDROELECTRIC PLANTS
Operational Study for Planning Purposes of a Pump-Storage Reservior System,
W81-00646 6B

HYDROGEN ION CONCENTRATION
The Effects of Hardness, Alkalinity and PH of Test Water on the Toxicity of Copper to Rainbow Trout (Salmo Gairdneri),
W81-00633 5C

HYDROGEOLOGY
Structure Contour Map of the Madison Group, Havre 1 Degree by 2 Degree Quadrangle, North-Central Montana,
W81-00652 7C

Structure Contour Map of the Top of the Madison Group, Great Falls 1 Degree by 2 Degree Quadrangle, North-Central Montana,
W81-00653 7C

Structure Contour Map of the Top of the Madison Group, Shelby 1 Degree by 2 Degree Quadrangle, North-Central Montana,
W81-00654 7C

Structure Contour Map of the Top of the Madison Group, Lewistown 1 Degree by 2 Degree Quadrangle, North-Central Montana,
W81-00655 7C

Aquifer Tests of the Navajo Sandstone Near Caineville, Wayne County, Utah,
W81-00657 2F

Ground-Water Hydrology of the Dade City Area, Pasco County, Florida, with Emphasis on the Hydrologic Effects of Pumping from the Floridan Aquifer,
W81-00661 4B

HYDROLOGIC DATA
Water Resources Data for Massachusetts and Rhode Island, Water Year 1979.
W81-00656 7C

Analysis of Stream Quality in the Yampa River Basin, Colorado and Wyoming,
W81-00660 5B

Water Resources Data for Colorado, Water Year 1979--Volume 1. Missouri River Basin, Akansas River Basin, and Rio Grande Basin.
W81-00669 7C

Water Resources Data for Colorado, Water Year 1979--Volume 2. Colorado River Basin above Dolores River.
W81-00670 7C

Water Resources Data for Colorado, Water Year 1979--Volume 3. Dolores River Basin, Green River Basin, and San Juan River Basin.
W81-00671 7C

HYDROLOGY
Applications of Remote Sensing in Hydrology,
W81-00505 7B

HYDROSTATIC PRESSURE
Use of the Deep-Shaft-Process in Upgrading and Extending Existing Sewage-Treatment Works,
W81-00608 5D

HYPOLIMNIOM
The Influence of River Water Quality on Storage Reservoir Management,
W81-00515 2H

ICE
Concentration of Impurities by Progressive Freezing,
W81-00731 5D

ILLINOIS
Ecological Comparison of Intermittent Streams in Different Land Use Patterns in Northeastern Illinois,
W81-00645 2E

IMPAIRED WATER USE
Planning Report for the Irrigation Portion of a Dual Water System for West Jordan City, Salt Lake County, Utah,
W81-00649 3C

INDIANA
Flood Magnitude and Frequency of Streams in Indiana: Preliminary Estimating Equations,
W81-00667 2E

Institutional and Legal Prescription of Water Use and Management,
W81-00678 6E

INDUSTRIAL PLANTS
Water Requirements and Costs for South Dakota Rural Manufacturing Firms,
W81-00550 6B

INDUSTRIAL WASTE
Reclamation of Cement Slurry,
W81-00530 5D

INDUSTRIAL WASTES
Implementation of the Control of Pollution Act, 1974,
W81-00579 6E

Recovery of Protein and Fat From Food Industry Waste Waters,
W81-00580 5D

Industrial Surcharges that Industry Likes,
W81-00607 5F

Primary Flocculation of Cadmium Plating Plant Effluent: Improved Occupational Hygiene and Effluent Quality,
W81-00614 5D

Feasibility of Purification and Concentration of Selected Wastewater Streams by Ultrafiltration,
W81-00701 5D

INFILTRATION
Sewer Grouts and How to Use Them.
W81-00728 8G

INFLOW
Sewer Grouts and How to Use Them.
W81-00728 8G

INLETS
Eutrophication in Peel Inlet-I. The Problem-Defining Behavior and a Mathematical Model for the Phosphorus Scenario,
W81-00725 5A

Eutrophication in Peel Inlet-II. Identification of Critical Uncertainties Via Generalized Sensitivity Analysis,
W81-00726 5B

INORGANIC CARBON
Nitrogen Loading: Influence on Dissolved Inorganic Carbon in Natural Waters,
W81-00688 2H

INSECTICIDES
Persistence of 12 Insecticides in Water,
W81-00625 5B

INSTITUTIONAL CONSTRAINTS
Institutional Problems of Water Quality Planning (Section 208) in Urbanizing Areas,
W81-00672 6E

Institutional and Legal Prescription of Water Use and Management,
W81-00678 6E

INSTRUMENTATION
Applications of Remote Sensing in Hydrology,
W81-00505 7B

Development and Application of a Field Instrumentation System for the Investigation of Surf Zone Hydrodynamics,
W81-00518 2J

INTAKES
Screens for Water Intakes,
W81-00520 8A

INTERMITTENT STREAMS
Ecological Comparison of Intermittent Streams in Different Land Use Patterns in Northeastern Illinois,
W81-00645 2E

INTERNATIONAL COMMISSIONS
Seventh Annual Report: Great Lakes Water Quality.
W81-00702 5D

INVERTEBRATES
The Mutagenic Activity in a Section of the Sheep River, Alberta Receiving a Chlorinated Sewage Effluent,
W81-00737 5B

ION EXCHANGE
Ion Exchange Method and Apparatus,
W81-00524 5G

ION TRANSPORT
Removal of Trace Metals from Sediments under Chemico-Osmotic Gradients,
W81-00504 5B

IRON
In-Ground Precipitation Ends Wellscreen Plugging,
W81-00588 5G

IRRIGATION
High Capacity Sprinkler Head with Improved Brake Mechanism,
W81-00544 3F

Automatic Control of the Moisture Content of the Soil,
W81-00708 3F

Irrigation Emitter System,
W81-00709 3F

Method and Device for Enhancing the Distribution of Water from a Sprinkler Operated at Low Pressures,
W81-00716 3F

IRRIGATION DESIGN
Planning Report for the Irrigation Portion of a Dual Water System for West Jordan City, Salt Lake County, Utah,
W81-00649 3C

IRRIGATION EFFECTS
Field Experiments on Application of Treated Municipal Waste Waters to Vegetated Lands,
W81-00620 3C

IRRIGATION EFFICIENCY
Automatic Wind Brace for Side Roll Irrigation System,
W81-00540 3F

IRRIGATION ENGINEERING
Entrainment of Ichthyoplankton by Irrigation Withdrawal Systems,
W81-00560 8I

IRRIGATION SYSTEMS
Drip Irrigation System for Agriculture,
W81-00538 3F

Irrigation Pipe Control System,
W81-00539 3F

Automatic Wind Brace for Side Roll Irrigation System,
W81-00540 3F

Wheel Rut Closing Device for Irrigation System,
W81-00541 3F

Argicultural Irrigation System and Components Therefor,
W81-00542 3F

Guidance System for Irrigation Sprinkling Apparatus,
W81-00543 3F

Flow control Valve for Subsurface Irrigation System,
W81-00545 3F

Agricultural Water Use and Costs in California,
W81-00644 3F

Self-Propelled Irrigation Apparatus,
W81-00715 3F

Three Layer Irrigation Tube and Apparatus and Method for Producing Same,
W81-00717 3F

IRRIGATION WELLS
Investigation of Factors Affecting Energy for Irrigation Pumping,
W81-00509 3F

ITERATIVE OPEN PLANNING PROCESS (IOPP)
Environmental Assessments in Water Resources Planning,
W81-00704 6B

JOHNSTOWN (PA)
Evaluation of Selected Dam-Break Flood-Wave Models by Using Field Data,
W81-00666 2E

KINETICS
The Effect of Dissolved Oxygen Concentration on Nitrification,
W81-00729 5D

LABORATORY EQUIPMENT
Determination of Chemical Oxygen Demand Using an Open-Tube Method,
W81-00571 7B

LABORATORY TEST
Improved Method Generates More Chlorine Dioxide,
W81-00610 5F

LABORATORY TESTS
Hydraulic Laboratory Techniques.
W81-00566 8A

A Laboratory Data-Processing System,
W81-00575 7C

Interlaboratory Comparison of Determinations of Trace Level Hydrocarbons in Mussels,
W81-00602 5A

LAKES
Saving the Lakes,
W81-00549 2H

A Limnological Investigation of Lake Liambezi, Caprivi,
W81-00551 2H

Preliminary Observations on the Benthic Macroinvertebrate Communities of Ross Bay, a Polluted Area of Lough Leane, South-West Ireland,
W81-00634 5C

Dynamics of Dissolved Oxygen During Algal Bloom in Lake Kasumigaura, Japan,
W81-00635 2H

Reductions in Inactivation Rates of Bacteriophages by Clay Minerals in Lake Water,
W81-00636 5G

Nitrogen Loading: Influence on Dissolved Inorganic Carbon in Natural Waters,
W81-00688 2H

A Conceptual Model of a Siltation System in Shallow Lakes with Littoral Vegetation,
W81-00739 2H

Mercury Concentrations in Fish Inhabiting Two Polluted Lakes in Northern Canada,
W81-00742 5B

LAND MANAGEMENT
Management of the Hydrologic System in Areas Subject to Coal Mining Activities,
W81-00502 5G

Disposal of Sewage Sludge to Land: Chemical and Microbiological Aspect of Sludge to Land Policy,
W81-00615 5E

LAND RECLAMATION
Water as a Parameter for Development of Energy Resources in the Upper Great Plains -- Effects on Land and Water Resources of Alternative Patterns of Coal-Based Energy Development,
W81-00691 6B

LAND USE
Ecological Comparison of Intermittent Streams in Different Land Use Patterns in Northeastern Illinois,
W81-00645 2E

LANDSAT
Applications of Remote Sensing in Hydrology,
W81-00505 7B

A Watershed Information System,
W81-00506 7B

LEGAL ASPECTS
Reasonable Ground Water Pumping Levels Under the Appropriation Doctrine: Law, Policy and Alternatives,
W81-00510 6E

Threading the Regulatory Maze: A Small Utility's View,
W81-00595 6E

Institutional Problems of Water Quality Planning (Section 208) in Urbanizing Areas,
W81-00672 6E

Institutional and Legal Prescription of Water Use and Management,
W81-00678 6E

Assessment and Recommendations for Community Water Resources Planning.
W81-00696 6B

LEGISLATION
Implementation of the Control of Pollution Act, 1974,
W81-00579 6E

How to Keep Ahead of the Regulators,
W81-00590 6E

The New Regulatory Constraints: From Conflict toward Compromise,
W81-00591 6E

LEWISTOWN QUADRANGLE
Structure Contour Map of the Top of the Madison Group, Lewistown 1 Degree by 2 Degree Quadrangle, North-Central Montana,
W81-00655 7C

LIGNITE
Texas Lignite: Environmental Planning Opportunities,
W81-00562 6A

LIMESTONES
Laboratory Application of Secondary Sewage Effluent to Argillaceous Limestone,
W81-00641 5D

LIMNOLOGY
A Limnological Investigation of Lake Liambezi, Caprivi,
W81-00551 2H

Playa Lakes Characterization Study,

Evaluation of Selected Dam-Break Flood-Wave Models by Using Field Data,
W81-00666 2E

A Variable-Discharge Model for Facultative Oxidation Ponds,
W81-00680 5D

A Comparison of Models for Completely Mixed Activated Sludge Treatment Design and Operation,
W81-00730 5D

An Ecological Risk Index for Aquatic Pollution Control. A Sedimentological Approach,
W81-00747 5C

MAUMEE RIVER BASIN
Multiobjective Analysis in the Maumee River Basin: A Case Study,
W81-00507 6A

MAYFLIES
Effect of Mild Tannery Pollution on Growth and Emergence of Two Aquatic Insects Rhithrogena Semicolorata and Emphemerella Ignita,
W81-00741 5C

MELTON HILL RESERVOIR (TN)
Terrestrial-Aquatic Linkages, Component Interactions and Potential Restriction of Growth of the Introduced Aquatic Weed Myriophyllum Spicatum L. (Water Milfoil) I,
W81-00687 2H

MEMBRANE PROCESSES
The Development of Chlorine Resistant Ultrathin Film Composite Membranes from Soluble Aromatic Polyimide Thin Films on Polybutylene Terephthalate Supports,
W81-00679 5D

MEMBRANES
The Development of Chlorine Resistant Ultrathin Film Composite Membranes from Soluble Aromatic Polyimide Thin Films on Polybutylene Terephthalate Supports,
W81-00679 5D

Development of Chlorine Resistant Membrane, Asymmetric Polyimide Membrane and Porous Substrates,
W81-00681 5G

Feasibility of Purification and Concentration of Selected Wastewater Streams by Ultrafiltration,
W81-00701 5D

MERCURY
Mercury Concentrations in Fish Inhabiting Two Polluted Lakes in Northern Canada,
W81-00742 5B

METAZOA
A Study of the Protozoan and Metazoan Populations of Three Oxidation Ditches,
W81-00573 5D

MICROBIAL DEGRADATION
Persistence of 12 Insecticides in Water,
W81-00625 5B

Rapid Assays for Microbial Degradation of 2-Chlorophenol,
W81-00697 5D

MICROBIOLOGY
Factors Influencing Viable Bacteria in a Turbid Man-Made Impoundment.
W81-00733 2H

MINE WASTES
Impacts of Uranium Mining and Milling Upon the Fish and Wildlife Resources of the New Mexico San Juan Basin Region,
W81-00555 5C

MISSISSIPPI RIVER
Water Conservation on the Upper Missouri and Mississippi Rivers Through Thermal Standards Modifications,
W81-00695 3E

MISSOURI RIVER
Water Conservation on the Upper Missouri and Mississippi Rivers Through Thermal Standards Modifications,
W81-00695 3E

Regional Five-Year Water Research and Development Goals and Objectives.
W81-00699 6E

MISSOURI RIVER BASIN (CO)
Water Resources Data for Colorado, Water Year 1979--Volume 1. Missouri River Basin, Akansas River Basin, and Rio Grande Basin.
W81-00669 7C

MODEL STUDIES
A Watershed Information System,
W81-00506 7B

Basin Development and Water Allocation,
W81-00514 6A

A Baseflow Simulation Model,
W81-00516 2E

Least Cost Design of Urban Drainage Systems,
W81-00552 4C

Optimal Parameter Estimation and Investigation of Objective Functions of Urban Runoff Models,
W81-00553 4C

An Empirical Kinetic Model of Trihalomethane Formation: Applications to Meet the Proposed THM Standard,
W81-00596 5F

On the Validity of the Codistillation Model for the Evaporation of Pesticides and Other Solutes From Water Solution,
W81-00604 7B

Microbial Viability Measurements and Activated Sludge Kinetics,
W81-00627 5D

Results of Computer Modeling of Groundwater Flow - The Calcium Carbonate Aquifer of the Central Roswell Basin,
W81-00642 2F

Estimated Inflow and Evaporation for Great Salt Lake, Utah, 1931-76, with Revised Model for Evaluating the Effects of Dikes on the Water and Salt Balance of the Lake,
W81-00658 2H

Extension of Transient-Flow Model of the Sacramento River at Sacramento, California,
W81-00663 2L

Evaluation of Selected Dam-Break Flood-Wave Models by Using Field Data,
W81-00666 2E

An Analysis of Residential Water Demand Schedules in Arkansas,
W81-00690 6D

Eutrophication in Peel Inlet-I. The Problem-Defining Behavior and a Mathematical Model for the Phosphorus Scenario,
W81-00725 5A

Eutrophication in Peel Inlet-II. Identification of Critical Uncertainties Via Generalized Sensitivity Analysis,
W81-00726 5B

A Conceptual Model of a Siltation System in Shallow Lakes with Littoral Vegetation,
W81-00739 2H

MONTANA

Structure Contour Map of the Madison Group, Havre 1 Degree by 2 Degree Quadrangle, North-Central Montana,
W81-00652 7C

Structure Contour Map of the Top of the Madison Group, Great Falls 1 Degree by 2 Degree Quadrangle, North-Central Montana,
W81-00653 7C

Structure Contour Map of the Top of the Madison Group, Shelby 1 Degree by 2 Degree Quadrangle, North-Central Montana,
W81-00654 7C

Structure Contour Map of the Top of the Madison Group, Lewistown 1 Degree by 2 Degree Quadrangle, North-Central Montana,
W81-00655 7C

MOUNTAIN WATERSHEDS

A Watershed Information System,
W81-00506 7B

MULTIPLE-PURPOSE PROJECTS

Management of the Hydrologic System in Areas Subject to Coal Mining Activities,
W81-00502 5G

Explorations in Multiobjective Water Resource History,
W81-00674 6B

MUNICIPAL WASTES

Use of the Deep-Shaft-Process in Upgrading and Extending Existing Sewage-Treatment Works,
W81-00608 5D

MUNICIPAL WATER

Cross-Connection Control Means Potable Water Safety.
W81-00589 5G

New Facilities Increase Capacity, Improve Efficiency,
W81-00594 8A

Threading the Regulatory Maze: A Small Utility's View,
W81-00595 6E

Industrial Surcharges that Industry Likes,
W81-00607 5F

Planning Report for the Irrigation Portion of a Dual Water System for West Jordan City, Salt Lake County, Utah,
W81-00649 3C

MUTAGENS

The Mutagenic Activity in a Section of the Sheep River, Alberta Receiving a Chlorinated Sewage Effluent,
W81-00737 5B

NATURAL GAS

Environmental Assessment of the Alaskan Continental Shelf: Kodiak Interim Synthesis Report -- 1980.
W81-00512 5C

NATURAL STREAMS

Pseudomonas Aeruginosa and Escherichia Coli in Sewage and Fresh Water,
W81-00736 5B

NAVAJO SANDSTONE

Aquifer Tests of the Navajo Sandstone Near Caineville, Wayne County, Utah,
W81-00657 2F

NETHERLANDS

An Investigation Into the Long-Term Effects of Rhine Water on Rainbow Trout,
W81-00743 5C

NEVADA

Basin Development and Water Allocation,
W81-00514 6A

Enviromental Controls on Occurrence and Chemistry of Groundwater in a Carbonate Terrane of Eastern Nevada,
W81-00637 2F

Variable Sources of Suspended Sediment and Nutrients from Small Watersheds,
W81-00638 5A

NEW ENGLAND

Water Resources Research Needs in New England,
W81-00548 6E

NEW MEXICO

Results of Computer Modeling of Groundwater Flow - The Calcium Carbonate Aquifer of the Central Roswell Basin,
W81-00642 2F

The Future of Agricultural Water Use in New Mexico,
W81-00643 6D

NITRIFICATION

The Effect of Dissolved Oxygen Concentration on Nitrification,
W81-00729 5D

NITROGEN

An Automated Method for the Simultaneous Determination of Nitrogen and Phosphorus in Plant Material, Sludge and Soil,
W81-00622 7B

NITROGEN LOADING

Nitrogen Loading: Influence on Dissolved Inorganic Carbon in Natural Waters,
W81-00688 2H

NUCLEAR WASTES

243,244-Cm in Columbia River Sediments,
W81-00611 5B

NUMERICAL ANALYSIS

Characteristic Evaluation of Trickling Filter Process,
W81-00732 5D

NUTRIENTS

Effects of Nutrients on Algal Growth in Waters of the Canberra Region and Related Control Measures,
W81-00586 5C

Agricultural Area Impacts within a Natural Area: Cades Cove, a Case History,
W81-00612 5C

Field Experiments on Application of Treated Municipal Waste Waters to Vegetated Lands,
W81-00620 3C

Preliminary Observations on the Benthic Macroinvertebrate Communities of Ross Bay, a Polluted Area of Lough Leane, South-West Ireland,
W81-00634 5C

Variable Sources of Suspended Sediment and Nutrients from Small Watersheds,
W81-00638 5A

ODOR

Experiences of High-Rate Biological Filtration at Derby Sewage-Treatment Works,
W81-00568 5D

Sensory Properties and Analysis of Two Muddy Odour Compounds, Geosmin and 2-Methylisoborneol, in Water and Fish,
W81-00748 5A

OIL POLLUTION

Oil-Collecting Ship for Oil Spills,
W81-00521 5G

Method for Breaking an Oil-in-Water Emulsion,
W81-00711 5D

Floating, Surface Liquids Retrieval System,
W81-00724 5G

OIL SPILLS

Oil-Collecting Ship for Oil Spills,
W81-00521 5G

Floating, Surface Liquids Retrieval System,
W81-00724 5G

OIL WASTES

Oily Effluent Treatment by the BP Treatment Process,
W81-00581 5D

ON-SITE TESTS

Dynamics of Dissolved Oxygen During Algal Bloom in Lake Kasumigaura, Japan,
W81-00635 2H

ORGANIC COMPOUNDS

The Effects of Permanganate Pretreatment on Trihalomethane Formation in Drinking Water,
W81-00570 5F

An Empirical Kinetic Model of Trihalomethane Formation: Applications to Meet the Proposed THM Standard,
W81-00596 5F

ORGANIC COMPOUNDS

On-Column Cryogenic Trapping of Sorbed Organics for Determination by Capillary Gas Chromatography,
W81-00600 7B

Gas Chromatographic-Mass Spectrometric Analysis of Chlorination Effects on Commercial Coal-Tar Leachate,
W81-00603 7B

GC/MS Identification of Trace Organics in Philadelphia Drinking Waters During a 2-Year Period,
W81-00623 5A

ORGANIC MATTER
Pilot Plant Study on Marine Microorganisms and Organic Matter in Seawater Desalination by Reverse Osmosis,
W81-00639 3A

ORGANIC WASTES
Water Solubility and Octanol/Water Partition Coefficients of Organics. Limitations of the Solubility-Partition Coefficient Correlation,
W81-00605 7B

On Farm Aerobic Treatment of Piggery Waste. The Effect of Residence Time and Storage on Effluent Quality,
W81-00738 5D

OXIDATION
Biooxidation in a Continuous Activated Sludge Process,
W81-00624 7B

OXIDATION LAGOONS
A Study of the Protozoan and Metazoan Populations of Three Oxidation Ditches,
W81-00573 5D

A Variable-Discharge Model for Facultative Oxidation Ponds,
W81-00680 5D

Effluent Treatment and Algae Recovery by Ozone-Induced Flotation,
W81-00744 5D

OXYGEN DEMAND
Oxygen Transport in Salmon Spawning Media,
W81-00676 8I

OZONE
Effluent Treatment and Algae Recovery by Ozone-Induced Flotation,
W81-00744 5D

Evaluation of Ozone Induced Biodegradability of Wastewater Treatment Plant Effluent,
W81-00746 5D

PACIFIC NORTHWEST U.S.
Regional Five-Year Research and Development Plan for Period 1982-1987. Pacific Northwest/Oceania Region.
W81-00547 6E

PALO VERDE VALLEY (CA)
Dissolved-Solids Concentrations and Loads in Return Flows to the Colorado River from Agricultural Land in Southern California,
W81-00664 5B

PASCO COUNTY (FL)
Ground-Water Hydrology of the Dade City Area, Pasco County, Florida, with Emphasis on the Hydrologic Effects of Pumping from the Floridan Aquifer,
W81-00661 4B

PATENTS
Screens for Water Intakes,
W81-00520 8A

Oil-Collecting Ship for Oil Spills,
W81-00521 5G

Apparatus for Filter Backwashing,
W81-00522 5G

Treatment of Aqueous Systems,
W81-00523 5G

Ion Exchange Method and Apparatus,
W81-00524 5G

Flushing System for Reverse Osmosis Water Purification Units,
W81-00525 5F

Filtration System for Household Sewage,
W81-00526 5D

Self Washing Belt Strainer,
W81-00527 5D

Two Zone Process for Biological Treatment of Waste Water,
W81-00528 5D

Process and Apparatus for the Biological Treatment of Waste Water,
W81-00529 5D

Reclamation of Cement Slurry,
W81-00530 5D

Liquid Clarification System,
W81-00531 5D

Selective Multiple Electrode Waste Water Treating System,
W81-00532 5D

Ferrite Flocculating System,
W81-00533 5D

Wastewater and Wastewater Solid Processing System,
W81-00534 5D

Apparatus for Clarifying Liquid,
W81-00535 5D

Determination of Water Saturation in Subsurface Earth Formations Adjacent Well Boreholes,
W81-00536 4B

Creating and Maintaining a Pool of Fresh Water on a Tabular Iceberg,
W81-00537 3B

Drip Irrigation System for Agriculture,
W81-00538 3F

Irrigation Pipe Control System,
W81-00539 3F

Automatic Wind Brace for Side Roll Irrigation System,
W81-00540 3F

Wheel Rut Closing Device for Irrigation System,
W81-00541 3F

Argicultural Irrigation System and Components Therefor,
W81-00542 3F

Guidance System for Irrigation Sprinkling Apparatus,
W81-00543 3F

High Capacity Sprinkler Head with Improved Brake Mechanism,
W81-00544 3F

Flow control Valve for Subsurface Irrigation System,
W81-00545 3F

Automatic Control of the Moisture Content of the Soil,
W81-00708 3F

Irrigation Emitter System,
W81-00709 3F

Method for Storing Waste Materials and Their Combustion Residues in a Manner Harmless to Underground Water,
W81-00710 5E

Method for Breaking an Oil-in-Water Emulsion,
W81-00711 5D

Method of Lowering the Color of Effluent Which Contains Aryl Azo- or Arly Nitro-Containing Compounds,
W81-00712 5D

Method and Device for Removing Solid and/or Liquid Means Containing Harmful Substances,
W81-00713 5G

Measurement of Water Flow Rate,
W81-00714 2E

Self-Propelled Irrigation Apparatus,
W81-00715 3F

Method and Device for Enhancing the Distribution of Water from a Sprinkler Operated at Low Pressures,
W81-00716 3F

Three Layer Irrigation Tube and Apparatus and Method for Producing Same,
W81-00717 3F

Kraft Pulp Bleaching and Recovery Process,
W81-00718 5D

Sewage Treatment,
W81-00719 5D

Process and Apparatus for Dewatering Granulated Material, Especially Granulated Blast Furnace Slag,
W81-00720 3E

Pleated Filter Underdrain, Method and Apparatus,
W81-00721 5G

Apparatus for Emergency Water Purification,
W81-00722 5F

Combination of a Biological Dry Toilet and a Biological Waste Water Purifying Plant,
W81-00723 5D

Floating, Surface Liquids Retrieval System,
W81-00724 5G

PATH OF POLLUTANTS
Chlorinated Paraffins and the Environment. 2. Aquatic and Avian Toxicology,
W81-00578 5C

PATHOGENIC BACTERIA
Reductions in Inactivation Rates of Bacteriophages by Clay Minerals in Lake Water,
W81-00636 5G

PENNSYLVANIA
Water Resources Research Program: Five-Year Projection (1982-1986), Pennsylvania Water Resources Research Center,
W81-00700 6E

PERSISTENCE
Persistence of 12 Insecticides in Water,
W81-00625 5B

PESTICIDE KINETICS
Persistence of 12 Insecticides in Water,
W81-00625 5B

PESTICIDES
On the Validity of the Codistillation Model for the Evaporation of Pesticides and Other Solutes From Water Solution,
W81-00604 7B

PHENOLS
Rapid Assays for Microbial Degradation of 2-Chlorophenol,
W81-00697 5D

PHOSPHORUS
Phosphorus Management for the Great Lakes.
W81-00511 5G

An Automated Method for the Simultaneous Determination of Nitrogen and Phosphorus in Plant Material, Sludge and Soil,
W81-00622 7B

Eutrophication in Peel Inlet-I. The Problem-Defining Behavior and a Mathematical Model for the Phosphorus Scenario,
W81-00725 5A

Eutrophication in Peel Inlet-II. Identification of Critical Uncertainties Via Generalized Sensitivity Analysis,
W81-00726 5B

PHOTOACTIVATION
UV-ozone and UV-oxygen Processes for Color Removal from Textile Dyeing and Finishing Wastewaters,
W81-00503 5D

PHYSICAL PROPERTIES
A Limnological Investigation of Lake Liambezi, Caprivi,
W81-00551 2H

PILOT PLANTS
Use of the Deep-Shaft-Process in Upgrading and Extending Existing Sewage-Treatment Works,
W81-00608 5D

Gravity Wash Column Design, Procurement, and Installation; Followed by Development Tests of the Modified Single-Stage Desalting Pilot Plant at Wrightsville Beach, North Carolina,
W81-00689 3A

PIPELINES
Water Quality Aspects of Coal Transportation by Slurry Pipeline,
W81-00673 5B

PLANKTON
Entrainment of Ichthyoplankton by Irrigation Withdrawal Systems,
W81-00560 8I

PLANNING
Multiobjective Analysis in the Maumee River Basin: A Case Study,
W81-00507 6A

Phosphorus Management for the Great Lakes.
W81-00511 5G

Involving the Public in Water and Power Resources Decisions,
W81-00558 6A

Development of the Bristol Regional Sewage-Treatment Works and Associated Sewerage Scheme,
W81-00618 5D

Operational Study for Planning Purposes of a Pump-Storage Reservior System,
W81-00646 6B

Explorations in Multiobjective Water Resource History,
W81-00674 6B

Five-Year Research Plan,
W81-00683 6E

1982-1986 Research and Development Plan for Florida Water Resources Research Center,
W81-00684 6E

A Five Year Water Research Plan for the State of Arkansas,
W81-00693 6E

Five-Year Water Resources Research and Development Plan: Fiscal Years 1982-1986.
W81-00694 6E

Assessment and Recommendations for Community Water Resources Planning.
W81-00696 6B

Water Resources Research Program: Five-Year Projection (1982-1986), Pennsylvania Water Resources Research Center,
W81-00700 6E

Urban Runoff Pollution and Water Quality Planning,
W81-00705 5B

PLANNNING
Texas Lignite: Environmental Planning Opportunities,
W81-00562 6A

PLANT GROWTH
Responses of Submersed Vascular Plant Communities to Environmental Change: Summary,
W81-00556 5C

PLAYAS
Playa Lakes Characterization Study,
W81-00554 2H

POLLUTANT IDENTIFICATION
Introduction (Special Issue on the Progress of an On-Going Program to Improve Methodologies for the Analysis of Priority Pollutants in Waste Water Effluents),
W81-00609 7B

Comparison of the Toxicity Thresholds of Water Pollutants to Bacteria, Algae, and Protozoa in the Cell Multiplication Inhibition Test,
W81-00628 5A

Methods for Detection of Virus in Wastewater, Applied to Samples from Small Scale Treatment Systems,
W81-00631 5A

Methods for the Isolation of Virus from Raw and Digested Wastewater Sludge,
W81-00632 5G

POLLUTANTS
Chlorinated Paraffins and the Environment. 1. Environmental Occurrence,
W81-00577 5B

POLLUTION ABATEMENT
Status Report on Abatement of Water Pollution From the Canadian Pulp and Paper Industry (1978).
W81-00703 5G

POLYCHLORINATED BIPHENYLS
On the Validity of the Codistillation Model for the Evaporation of Pesticides and Other Solutes From Water Solution,
W81-00604 7B

POLYMERS
Development of Chlorine Resistant Membrane, Asymmetric Polyimide Membrane and Porous Substrates,
W81-00681 5G

PONDS
A Variable-Discharge Model for Facultative Oxidation Ponds,
W81-00680 5D

POTABLE WATER
Cross-Connection Control Means Potable Water Safety.
W81-00589 5G

Drinking Water Chlorination: A Practice Unrelated to Cancer Mortality,
W81-00592 5F

An Empirical Kinetic Model of Trihalomethane Formation: Applications to Meet the Proposed THM Standard,
W81-00596 5F

Gas Chromatographic-Mass Spectrometric Analysis of Chlorination Effects on Commercial Coal-Tar Leachate,
W81-00603 7B

Rebuilding Lengthens Filter Runs for Algae-Plagued Utility,
W81-00606 5F

GC/MS Identification of Trace Organics in Philadelphia Drinking Waters During a 2-Year Period,
W81-00623 5A

Endotoxins, Algae and Limulus Amoebocyte Lysate Test in Drinking Water,
W81-00740 5F

POWERPLANTS
Strategy for Assessing Impacts of Power Plants on Fish and Shellfish Populations,
W81-00563 6B

PRICING
Designing Equitable Water Rates: What Managers Need Know,
W81-00593 6C

An Analysis of Residential Water Demand Schedules in Arkansas,
W81-00690 6D

PRIMARY PRODUCTIVITY
Sources of Variability in Macroalgal Primary Productivity: Sampling and Interpretative Problems,
W81-00707 5C

PROTOZOA
A Study of the Protozoan and Metazoan Populations of Three Oxidation Ditches,
W81-00573 5D

Comparison of the Toxicity Thresholds of Water Pollutants to Bacteria, Algae, and Protozoa in the Cell Multiplication Inhibition Test,
W81-00628 5A

PSEUDOMONAS
Pseudomonas Aeruginosa and Escherichia Coli in Sewage and Fresh Water,
W81-00736 5B

PUBLIC HEALTH
Disposal of Sewage Sludge to Land: Chemical and Microbiological Aspect of Sludge to Land Policy,
W81-00615 5E

PULP AND PAPER INDUSTRY
Detoxification of Kraft Pulpmill Effluents by Foam Separation.
W81-00597 5D

Status Report on Abatement of Water Pollution From the Canadian Pulp and Paper Industry (1978).
W81-00703 5G

PULP WASTES
Status Report on Abatement of Water Pollution From the Canadian Pulp and Paper Industry (1978).
W81-00703 5G

PUMPED STORAGE
Operational Study for Planning Purposes of a Pump-Storage Reservior System,
W81-00646 6B

PUMPING PLANTS
Investigation of Factors Affecting Energy for Irrigation Pumping,
W81-00509 3F

Reasonable Ground Water Pumping Levels Under the Appropriation Doctrine: Law, Policy and Alternatives,
W81-00510 6E

PUMPING TESTS
Investigation of Factors Affecting Energy for Irrigation Pumping,
W81-00509 3F

RADIOACTIVE WASTES
Impacts of Uranium Mining and Milling Upon the Fish and Wildlife Resources of the New Mexico San Juan Basin Region,
W81-00555 5C

RAINBOW TROUT
The Effects of Hardness, Alkalinity and PH of Test Water on the Toxicity of Copper to Rainbow Trout (Salmo Gairdneri),
W81-00633 5C

An Investigation Into the Long-Term Effects of Rhine Water on Rainbow Trout,
W81-00743 5C

RAINFALL-RUNOFF RELATIONSHIPS
Optimal Parameter Estimation and Investigation of Objective Functions of Urban Runoff Models,
W81-00553 4C

RECYCLING
Want Not, Waste Not. Sensible Sludge Recycling,
W81-00585 5E

REGIONAL ANALYSIS
Regional Five-Year Water Research and Development Goals and Objectives.
W81-00699 6E

REMOTE SENSING
Applications of Remote Sensing in Hydrology,
W81-00505 7B

A Watershed Information System,
W81-00506 7B

RESEARCH AND DEVELOPMENT
Five Year Plan of Water Resources Research and Development for Connecticut,
W81-00675 6E

Development of Chlorine Resistant Membrane, Asymmetric Polyimide Membrane and Porous Substrates,
W81-00681 5G

Five-Year Research Plan,
W81-00683 6E

1982-1986 Research and Development Plan for Florida Water Resources Research Center,
W81-00684 6E

A Five Year Water Research Plan for the State of Arkansas,
W81-00693 6E

Five-Year Water Resources Research and Development Plan: Fiscal Years 1982-1986.
W81-00694 6E

Regional Five-Year Water Research and Development Goals and Objectives.
W81-00699 6E

Water Resources Research Program: Five-Year Projection (1982-1986), Pennsylvania Water Resources Research Center,
W81-00700 6E

RESEARCH PRIORITIES
Regional Five-Year Research and Development Plan for Period 1982-1987. Pacific Northwest/ Oceania Region.
W81-00547 6E

Water Resources Research Needs in New England,
W81-00548 6E

Explorations in Multiobjective Water Resource History,
W81-00674 6B

Five Year Plan of Water Resources Research and Development for Connecticut,
W81-00675 6E

Five-Year Research Plan,
W81-00683 6E

1982-1986 Research and Development Plan for Florida Water Resources Research Center,
W81-00684 6E

A Five Year Water Research Plan for the State of Arkansas,
W81-00693 6E

Five-Year Water Resources Research and Development Plan: Fiscal Years 1982-1986.
W81-00694 6E

Regional Five-Year Water Research and Development Goals and Objectives.
W81-00699 6E

Water Resources Research Program: Five-Year Projection (1982-1986), Pennsylvania Water Resources Research Center,
W81-00700 6E

RESERVOIRS
The Influence of River Water Quality on Storage Reservoir Management,
W81-00515 2H

Entrainment of Ichthyoplankton by Irrigation Withdrawal Systems,
W81-00560 8I

243,244-Cm in Columbia River Sediments,
W81-00611 5B

Operational Study for Planning Purposes of a Pump-Storage Reservior System,
W81-00646 6B

Terrestrial-Aquatic Linkages, Component Interactions and Potential Restriction of Growth of the Introduced Aquatic Weed Myriophyllum Spicatum L. (Water Milfoil) I,
W81-00687 2H

RESPIRATION
Dynamics of Dissolved Oxygen During Algal Bloom in Lake Kasumigaura, Japan,
W81-00635 2H

Effects of Streambank Materials Additions upon Microbial Activities of Two Sub-Arctic Canadian Rivers,
W81-00750 5C

RETURN FLOW
Field Experiments on Application of Treated Municipal Waste Waters to Vegetated Lands,
W81-00620 3C

Dissolved-Solids Concentrations and Loads in Return Flows to the Colorado River from Agricultural Land in Southern California,
W81-00664 5B

REVERSE OSMOSIS
Flushing System for Reverse Osmosis Water Purification Units,
W81-00525 5F

Pilot Plant Study on Marine Microorganisms and Organic Matter in Seawater Desalination by Reverse Osmosis,
W81-00639 3A

The Development of Chlorine Resistant Ultrathin Film Composite Membranes from Soluble Aromatic Polyimide Thin Films on Polybutylene Terephthalate Supports,
W81-00679 5D

Development of Chlorine Resistant Membrane, Asymmetric Polyimide Membrane and Porous Substrates,
W81-00681 5G

REVIEWS
A Bibliography of Stream Alteration (Channelization),
W81-00546 10C

The Effect of Dissolved Oxygen Concentration on Nitrification,
W81-00729 5D

RHODE ISLAND
Water Resources Data for Massachusetts and Rhode Island, Water Year 1979.
W81-00656 7C

RIO GRANDE BASIN (CO)
Water Resources Data for Colorado, Water Year 1979--Volume 1. Missouri River Basin, Akansas River Basin, and Rio Grande Basin.
W81-00669 7C

RIVER BASIN DEVELOPMENT
Multiobjective Analysis in the Maumee River Basin: A Case Study,
W81-00507 6A

RIVER BASINS
Multiobjective Analysis in the Maumee River Basin: A Case Study,
W81-00507 6A

RIVER FLOW
RVRFLO: A Hydraulic Simulator of Water Quality in the Housatonic River in Connecticut,
W81-00651 5B

RIVERS
The Influence of River Water Quality on Storage Reservoir Management,
W81-00515 2H

Effects of Streambank Materials Additions upon Microbial Activities of Two Sub-Arctic Canadian Rivers,
W81-00750 5C

ROCKY MOUNTAINS
A Watershed Information System,
W81-00506 7B

ROTA
Freshwater Use Customs on Rota: An Exploratory Study.
W81-00640 7C

RURAL AREAS
Water Requirements and Costs for South Dakota Rural Manufacturing Firms,
W81-00550 6B

SACRAMENTO RIVER (CA)
Extension of Transient-Flow Model of the Sacramento River at Sacramento, California,
W81-00663 2L

SALMON
Oxygen Transport in Salmon Spawning Media,
W81-00676 8I

SALMONELLA
The Survival of Salmonellae in Sewage Sludge Applied to Arable Land,
W81-00572 5E

SALT BALANCE
Estimated Inflow and Evaporation for Great Salt Lake, Utah, 1931-76, with Revised Model for Evaluating the Effects of Dikes on the Water and Salt Balance of the Lake,
W81-00658 2H

SAMPLING
Urban Runoff Pollution and Water Quality Planning,
W81-00705 5B

SAN ANTONIO AREA (TX)
Records of Ground-Water Recharge and Discharge, 1934-78; Water Levels, 1975-78; and Chemical Quality of Water, 1977-78, for the Edwards Aquifer in the San Antonio Area, Texas.
W81-00668 2F

SAN FRANCISCO
The Effect of San Francisco's Wastewater Plan on Water Quality and Aquatic Biology,
W81-00647 5F

SAN JUAN RIVER BASIN (CO)
Water Resources Data for Colorado, Water Year 1979--Volume 3. Dolores River Basin, Green River Basin, and San Juan River Basin.
W81-00671 7C

SANITARY ENGINEERING
Sewage Disposal in Developing Countries: Some Throughts,
W81-00574 5D

SATELLITES (ARTIFICIAL)
Applications of Remote Sensing in Hydrology,
W81-00505 7B

SEA WATER
Pilot Plant Study on Marine Microorganisms and Organic Matter in Seawater Desalination by Reverse Osmosis,
W81-00639 3A

SEDIMENT TRANSPORT
Variable Sources of Suspended Sediment and Nutrients from Small Watersheds,
W81-00638 5A

SEDIMENT YIELD
Variable Sources of Suspended Sediment and Nutrients from Small Watersheds,
W81-00638 5A

SEDIMENTATION
Anthropogenic Influence of the Sedimentary Regime of an Urban Estuary - Boston Harbor,
W81-00519 2L

Responses of Submersed Vascular Plant Communities to Environmental Change: Summary,
W81-00556 5C

SEDIMENTOLOGY
Holocene Geomorphic Evolution of a Barrier-Salt Marsh System, SW Delaware Bay,
W81-00517 2L

SEDIMENTS
Removal of Trace Metals from Sediments under Chemico-Osmotic Gradients,
W81-00504 5B

Mercury Concentrations in Fish Inhabiting Two Polluted Lakes in Northern Canada,
W81-00742 5B

An Ecological Risk Index for Aquatic Pollution Control. A Sedimentological Approach,
W81-00747 5C

Effects of Streambank Materials Additions upon Microbial Activities of Two Sub-Arctic Canadian Rivers,
W81-00750 5C

SELF PURIFICATION
Removal of Trace Metals from Sediments under Chemico-Osmotic Gradients,
W81-00504 5B

SEMIARID CLIMATES
Basin Development and Water Allocation,
W81-00514 6A

SEPARATION TECHNIQUES
On-Column Cryogenic Trapping of Sorbed Organics for Determination by Capillary Gas Chromatography,
W81-00600 7B

Gravity Wash Column Design, Procurement, and Installation; Followed by Development Tests of the Modified Single-Stage Desalting Pilot Plant at Wrightsville Beach, North Carolina,
W81-00689 3A

SEWAGE
The Effect of San Francisco's Wastewater Plan on Water Quality and Aquatic Biology,
W81-00647 5F

Pseudomonas Aeruginosa and Escherichia Coli in Sewage and Fresh Water,
W81-00736 5B

SEWAGE BACTERIA
The Effect of San Francisco's Wastewater Plan on Water Quality and Aquatic Biology,
W81-00647 5F

SEWAGE DISTRICTS
Development of the Bristol Regional Sewage-Treatment Works and Associated Sewerage Scheme,
W81-00618 5D

SEWAGE EFFLUENTS
Implementation of the Control of Pollution Act, 1974,
W81-00579 6E

Effects of Urban Runoff and Treated Municipal Wastewater on a Man-Made Channel in Northeastern Illinois,
W81-00626 5C

Preliminary Observations on the Benthic Macroinvertebrate Communities of Ross Bay, a Polluted Area of Lough Leane, South-West Ireland,
W81-00634 5C

The Mutagenic Activity in a Section of the Sheep River, Alberta Receiving a Chlorinated Sewage Effluent,
W81-00737 5B

Evaluation of Ozone Induced Biodegradability of Wastewater Treatment Plant Effluent,
W81-00746 5D

SEWAGE SLUDGE
The Survival of Salmonellae in Sewage Sludge Applied to Arable Land,
W81-00572 5E

Want Not, Waste Not. Sensible Sludge Recycling,
W81-00585 5E

Activated Sludge Settlement - Some Suppositions and Suggestions,
W81-00617 5D

The Estimation of Arsenic Concentrations in Sewage Sludges from the Lothian Region,
W81-00621 5A

Methods for the Isolation of Virus from Raw and Digested Wastewater Sludge,
W81-00632 5G

SEWAGE TREATMENT
Saving the Lakes,
W81-00549 2H

Sewage Disposal in Developing Countries: Some Throughts,
W81-00574 5D

Uprating Activated-Sludge Plants Using Rotary Biological Contactors,
W81-00582 5D

Experience in Operating the Deep-Shaft Activated Sludge Process,
W81-00583 5D

Fluidized- and Expanded-Bed Reactors for Waste-Water Treatment,
W81-00584 5D

Effects of Nutrients on Algal Growth in Waters of the Canberra Region and Related Control Measures,
W81-00586 5C

The Clarification of Effluent from an Activated-Sludge Plant Using Dissolved-Air Flotation,
W81-00587 5D

Use of the Deep-Shaft-Process in Upgrading and Extending Existing Sewage-Treatment Works,
W81-00608 5D

Design of Biological Filtration Plants,
W81-00616 5F

Activated Sludge Settlement - Some Suppositions and Suggestions,
W81-00617 5D

Development of the Bristol Regional Sewage-Treatment Works and Associated Sewerage Scheme,
W81-00618 5D

Laboratory Application of Secondary Sewage Effluent to Argillaceous Limestone,
W81-00641 5D

Sewage Treatment,
W81-00719 5D

Biodegradability Determinations in Trickling Filter Units Compared With the OECD Confirmatory Test,
W81-00735 5D

SEWERS
Sewer Grouts and How to Use Them.
W81-00728 8G

SHALLOW WATER
A Conceptual Model of a Siltation System in Shallow Lakes with Littoral Vegetation,
W81-00739 2H

SHELBY QUADRANGLE
Structure Contour Map of the Top of the Madison Group, Shelby 1 Degree by 2 Degree Quadrangle, North-Central Montana,
W81-00654 7C

SHELLFISH
Strategy for Assessing Impacts of Power Plants on Fish and Shellfish Populations,
W81-00563 6B

SILTING
A Conceptual Model of a Siltation System in Shallow Lakes with Littoral Vegetation,
W81-00739 2H

SIMULALTION ANALYSIS
RVRFLO: A Hydraulic Simulator of Water Quality in the Housatonic River in Connecticut,
W81-00651 5B

SIMULATION ANALYSIS
Operational Study for Planning Purposes of a Pump-Storage Reservior System,
W81-00646 6B

SLUDGE DIGESTION
Use of the Deep-Shaft-Process in Upgrading and Extending Existing Sewage-Treatment Works,
W81-00608 5D

SLUDGE DISPOSAL
Recovery of Protein and Fat From Food Industry Waste Waters,
W81-00580 5D

Want Not, Waste Not. Sensible Sludge Recycling,
W81-00585 5E

Disposal of Sewage Sludge to Land: Chemical and Microbiological Aspect of Sludge to Land Policy,
W81-00615 5E

Development of the Bristol Regional Sewage-Treatment Works and Associated Sewerage Scheme,
W81-00618 5D

Methods for the Isolation of Virus from Raw and Digested Wastewater Sludge,
W81-00632 5G

Enhanced Solar Drying of Wastewater Sludge,
W81-00682 5D

SLUDGE TREATMENT
Treatment of Industrial Liquid Wastes by Electroflotation,
W81-00567 5D

A Comparison of Models for Completely Mixed Activated Sludge Treatment Design and Operation,
W81-00730 5D

SLURRIES
Water Quality Aspects of Coal Transportation by Slurry Pipeline,
W81-00673 5B

SMALL WATERSHEDS
Variable Sources of Suspended Sediment and Nutrients from Small Watersheds,
W81-00638 5A

SOCIAL IMPACT
Water as a Parameter for Development of Energy Resources in the Upper Great Plains – Socioeconomic Effects of Alternative Patterns of Coal-Based Energy Development,
W81-00692 6B

SOIL CONTAMINATION
Disposal of Sewage Sludge to Land: Chemical and Microbiological Aspect of Sludge to Land Policy,
W81-00615 5E

SOIL MOISTURE
Automatic Control of the Moisture Content of the Soil,
W81-00708 3F

SOLAR DISTILLATION
Enhanced Solar Drying of Wastewater Sludge,
W81-00682 5D

SOLID WASTES
Enhanced Solar Drying of Wastewater Sludge,
W81-00682 5D

SOLUBILITY
Water Solubility and Octanol/Water Partition Coefficients of Organics. Limitations of the Solubility-Partition Coefficient Correlation,
W81-00605 7B

SOLUTES
Concentration of Impurities by Progressive Freezing,
W81-00731 5D

SOUTH DAKOTA
Water Requirements and Costs for South Dakota Rural Manufacturing Firms,
W81-00550 6B

SPAWNING
Oxygen Transport in Salmon Spawning Media,
W81-00676 8I

SPECIATION
Exchange of Comments on Scheme for Classification of Heavy Metal Species in Natural Waters,
W81-00599 5A

SPECTROMETRY
Determination of Alpha-Chloroacetanilides in Water by Gas Chromatography and Infrared Spectrometry,
W81-00601 7B

SPECTROPHOTOMETRY
Base Peak Profiles of Gas Chromatography-Mass Spectrometric Data Obtained From Thermal Desorption of Activated Carbons,
W81-00569 7B

Automated Distillation-Spectophotometry Procedure for Determining ammonia in Water,
W81-00576 5A

Blanking System for the Spectrophotometric Determination of Ammonia in Surface Waters,
W81-00598 5A

SPRINGS
Enviromental Controls on Occurrence and Chemistry of Groundwater in a Carbonate Terrane of Eastern Nevada,
W81-00637 2F

SPRINKLER IRRIGATION
Guidance System for Irrigation Sprinkling Apparatus,
W81-00543 3F

High Capacity Sprinkler Head with Improved Brake Mechanism,
W81-00544 3F

Method and Device for Enhancing the Distribution of Water from a Sprinkler Operated at Low Pressures,
W81-00716 3F

ST. CROIX
Pilot Plant Study on Marine Microorganisms and Organic Matter in Seawater Desalination by Reverse Osmosis,
W81-00639 3A

STANDING WATERS
Bathymetric Studies on the Pongolo River Flood Plain,
W81-00734 2D

STATE GOVERNMENTS
Efficient Government Institution for Water Quality Control,
W81-00648 6E

STATISTICAL METHODS
Analysis of Stream Quality in the Yampa River Basin, Colorado and Wyoming,
W81-00660 5B

STATISTICAL MODELS
An Analysis of Residential Water Demand Schedules in Arkansas,
W81-00690 6D

STORM RUNOFF
Effects of Urban Runoff and Treated Municipal Wastewater on a Man-Made Channel in Northeastern Illinois,
W81-00626 5C

STRATIFICATION
Dynamics of Dissolved Oxygen During Algal Bloom in Lake Kasumigaura, Japan,
W81-00635 2H

STREAMFLOW
A Baseflow Simulation Model,
W81-00516 2E

A Bibliography of Stream Alteration (Channelization),
W81-00546 10C

Analysis of Stream Quality in the Yampa River Basin, Colorado and Wyoming,
W81-00660 5B

Extension of Transient-Flow Model of the Sacramento River at Sacramento, California,
W81-00663 2L

Low-Flow Characteristics of Louisiana Streams,
W81-00665 2E

STREAMFLOW FORECASTING
Predicting Normal Mimimum-Flow Rates for Ungaged Streams in West Virginia,
W81-00685 2E

STREAMS
Flood Magnitude and Frequency of Streams in Indiana: Preliminary Estimating Equations,
W81-00667 2E

STRIP MINES
Texas Lignite: Environmental Planning Opportunities,
W81-00562 6A

SUBARCTIC
Effects of Streambank Materials Additions upon Microbial Activities of Two Sub-Arctic Canadian Rivers,
W81-00750 5C

SUBSURFACE FLOW
A Baseflow Simulation Model,
W81-00516 2E

SUBSURFACE IRRIGATION
Flow control Valve for Subsurface Irrigation System,
W81-00545 3F

SUBURBAN AREAS
Assessment and Recommendations for Community Water Resources Planning.
W81-00696 6B

SURFACE WATER AVAILABILITY
Water as a Parameter for Development of Energy Resources in the Upper Great Plains -- Effects on Land and Water Resources of Alternative Patterns of Coal-Based Energy Development,
W81-00691 6B

SURFACE WATERS
Direct Filtration of Virginia Surface Waters: Feasibility and Costs,
W81-00501 5F

The Influence of River Water Quality on Storage Reservoir Management,
W81-00515 2H

Automated Distillation-Spectophotometry Procedure for Determining ammonia in Water,
W81-00576 5A

Blanking System for the Spectrophotometric Determination of Ammonia in Surface Waters,
W81-00598 5A

Water Resources Data for Massachusetts and Rhode Island, Water Year 1979.
W81-00656 7C

Reconnaissance of Chemical Quality of Surface Water and Fluvial Sediment in the Dirty Devil River Basin, Utah,
W81-00659 2K

Water Resources Data for Colorado, Water Year 1979--Volume 1. Missouri River Basin, Akansas River Basin, and Rio Grande Basin.
W81-00669 7C

Water Resources Data for Colorado, Water Year 1979--Volume 2. Colorado River Basin above Dolores River.
W81-00670 7C

Water Resources Data for Colorado, Water Year 1979--Volume 3. Dolores River Basin, Green River Basin, and San Juan River Basin.
W81-00671 7C

SURVEYS
Bathymetric Studies on the Pongolo River Flood Plain,
W81-00734 2D

SWAMPS. *FILTRATION
In-Situ Evaluation of the Filtering Function of a Piedmont Creek Swamp,
W81-00677 5B

TAMPA BAY (FL)
Water Quality of Tampa Bay, Florida: June 1972 - May 1976,
W81-00662 5A

TANNERY WASTES
Effect of Mild Tannery Pollution on Growth and Emergence of Two Aquatic Insects Rhithrogena Semicolorata and Emphemerella Ignita,
W81-00741 5C

TERTIARY TREATMENT
Methods for the Isolation of Virus from Raw and Digested Wastewater Sludge,
W81-00632 5G

TESTING PROCEDURES
Determination of Chemical Oxygen Demand Using an Open-Tube Method,
W81-00571 7B

Biodegradability Determinations in Trickling Filter Units Compared With the OECD Confirmatory Test,
W81-00735 5D

TETON DAM (ID)
Evaluation of Selected Dam-Break Flood-Wave Models by Using Field Data,
W81-00666 2E

TEXTILES
UV-ozone and UV-oxygen Processes for Color Removal from Textile Dyeing and Finishing Wastewaters,
W81-00503 5D

THERMAL POLLUTION
Water Conservation on the Upper Missouri and Mississippi Rivers Through Thermal Standards Modifications,
W81-00695 3E

THERMAL POWERPLANTS
Water Conservation on the Upper Missouri and Mississippi Rivers Through Thermal Standards Modifications,
W81-00695 3E

THERMODYNAMIC BEHAVIOR
Exchange of Comments on Scheme for Classification of Heavy Metal Species in Natural Waters,
W81-00599 5A

THIRD SISTER LAKE (MI)
Nitrogen Loading: Influence on Dissolved Inorganic Carbon in Natural Waters,
W81-00688 2H

TIDAL STREAMS
Extension of Transient-Flow Model of the Sacramento River at Sacramento, California,
W81-00663 2L

TOCCA FALLS (GA)
Evaluation of Selected Dam-Break Flood-Wave Models by Using Field Data,
W81-00666 2E

TOXICITY
Potential Impacts of Low pH on Fish and Fish Populations,
W81-00564 5C

Chlorinated Paraffins and the Environment. 2. Aquatic and Avian Toxicology,
W81-00578 5C

Growth Responses of Selected Freshwater Algae to Trace Elements and Scrubber Ash Slurry Generated by Coal-Fired Power Plants,
W81-00629 5C

The Effects of Hardness, Alkalinity and PH of Test Water on the Toxicity of Copper to Rainbow Trout (Salmo Gairdneri),
W81-00633 5C

An Investigation Into the Long-Term Effects of Rhine Water on Rainbow Trout,
W81-00743 5C

TOXINS
Disposal of Sewage Sludge to Land: Chemical and Microbiological Aspect of Sludge to Land Policy,
W81-00615 5E

TRACE ELEMENTS
Growth Responses of Selected Freshwater Algae to Trace Elements and Scrubber Ash Slurry Generated by Coal-Fired Power Plants,
W81-00629 5C

In-Situ Evaluation of the Filtering Function of a Piedmont Creek Swamp,
W81-00677 5B

TRACE METALS
Removal of Trace Metals from Sediments under Chemico-Osmotic Gradients,
W81-00504 5B

TREATMENT FACILITIES
New Facilities Increase Capacity, Improve Efficiency,
W81-00594 8A

TRICKLING FILTERS
Design of Biological Filtration Plants,
W81-00616 5F

Characteristic Evaluation of Trickling Filter Process,
W81-00732 5D

Biodegradability Determinations in Trickling Filter Units Compared With the OECD Confirmatory Test,
W81-00735 5D

TROPIC
A Limnological Investigation of Lake Liambezi, Caprivi,
W81-00551 2H

TURBIDITY
Responses of Submersed Vascular Plant Communities to Environmental Change: Summary,
W81-00556 5C

UNGAGED STREAMS
Predicting Normal Mimimum-Flow Rates for Ungaged Streams in West Virginia,
W81-00685 2E

UNITED STATES
Seventh Annual Report: Great Lakes Water Quality.
W81-00702 5D

UNSTEADY FLOW
Extension of Transient-Flow Model of the Sacramento River at Sacramento, California,
W81-00663 2L

UPPER COLORADO RIVER BASIN (UT)
Reconnaissance of Chemical Quality of Surface Water and Fluvial Sediment in the Dirty Devil River Basin, Utah,
W81-00659 2K

URANIUM RADIOISOTOPES
Impacts of Uranium Mining and Milling Upon the Fish and Wildlife Resources of the New Mexico San Juan Basin Region,
W81-00555 5C

URBAN DRAINAGE
Least Cost Design of Urban Drainage Systems,
W81-00552 4C

URBAN HYDROLOGY
Optimal Parameter Estimation and Investigation of Objective Functions of Urban Runoff Models,
W81-00553 4C

URBAN RUNOFF
Optimal Parameter Estimation and Investigation of Objective Functions of Urban Runoff Models,
W81-00553 4C

Urban Runoff Pollution and Water Quality Planning,
W81-00705 5B

UTAH
Planning Report for the Irrigation Portion of a Dual Water System for West Jordan City, Salt Lake County, Utah,
W81-00649 3C

Estimated Inflow and Evaporation for Great Salt Lake, Utah, 1931-76, with Revised Model for Evaluating the Effects of Dikes on the Water and Salt Balance of the Lake,
W81-00658 2H

UTILITIES
Designing Equitable Water Rates: What Managers Need Know,
W81-00593 6C

VEGETATION
Playa Lakes Characterization Study,
W81-00554 2H

A Conceptual Model of a Siltation System in Shallow Lakes with Littoral Vegetation,
W81-00739 2H

VIRGINIA
Direct Filtration of Virginia Surface Waters: Feasibility and Costs,
W81-00501 5F

VIRUSES
Methods for Detection of Virus in Wastewater, Applied to Samples from Small Scale Treatment Systems,
W81-00631 5A

Methods for the Isolation of Virus from Raw and Digested Wastewater Sludge,
W81-00632 5G

Reductions in Inactivation Rates of Bacteriophages by Clay Minerals in Lake Water,
W81-00636 5G

VIRUSES

The Stability of Bovine Parvovirus and its Possible Use as an Indicator for the Persistence of Enteric Viruses,
W81-00749 5A

WASHINGTON
Saving the Lakes,
W81-00549 2H

Five-Year Water Resources Research and Development Plan: Fiscal Years 1982-1986.
W81-00694 6E

WASTE DISPOSAL
Anthropogenic Influence of the Sedimentary Regime of an Urban Estuary - Boston Harbor,
W81-00519 2L

Method for Storing Waste Materials and Their Combustion Residues in a Manner Harmless to Underground Water,
W81-00710 5E

The Stability of Bovine Parvovirus and its Possible Use as an Indicator for the Persistence of Enteric Viruses,
W81-00749 5A

WASTE SPILLS
Method and Device for Removing Solid and/or Liquid Means Containing Harmful Substances,
W81-00713 5G

WASTE STORAGE
Method for Storing Waste Materials and Their Combustion Residues in a Manner Harmless to Underground Water,
W81-00710 5E

WASTE TREATMENT
The Development of Chlorine Resistant Ultrathin Film Composite Membranes from Soluble Aromatic Polyimide Thin Films on Polybutylene Terephthalate Supports,
W81-00679 5D

Enhanced Solar Drying of Wastewater Sludge,
W81-00682 5D

WASTE WATER DISPOSAL
Field Experiments on Application of Treated Municipal Waste Waters to Vegetated Lands,
W81-00620 3C

The Effect of San Francisco's Wastewater Plan on Water Quality and Aquatic Biology,
W81-00647 5F

WASTE WATER TREATMENT
UV-ozone and UV-oxygen Processes for Color Removal from Textile Dyeing and Finishing Wastewaters,
W81-00503 5D

Self Washing Belt Strainer,
W81-00527 5D

Two Zone Process for Biological Treatment of Waste Water,
W81-00528 5D

Process and Apparatus for the Biological Treatment of Waste Water,
W81-00529 5D

Reclamation of Cement Slurry,
W81-00530 5D

Liquid Clarification System,
W81-00531 5D

Selective Multiple Electrode Waste Water Treating System,
W81-00532 5D

Ferrite Flocculating System,
W81-00533 5D

Wastewater and Wastewater Solid Processing System,
W81-00534 5D

Apparatus for Clarifying Liquid,
W81-00535 5D

Treatment of Industrial Liquid Wastes by Electroflotation,
W81-00567 5D

Experiences of High-Rate Biological Filtration at Derby Sewage-Treatment Works,
W81-00568 5D

Recovery of Protein and Fat From Food Industry Waste Waters,
W81-00580 5D

Oily Effluent Treatment by the BP Treatment Process,
W81-00581 5D

Fluidized- and Expanded-Bed Reactors for Waste-Water Treatment,
W81-00584 5D

Detoxification of Kraft Pulpmill Effluents by Foam Separation.
W81-00597 5D

Microbial Viability Measurements and Activated Sludge Kinetics,
W81-00627 5D

Methods for Detection of Virus in Wastewater, Applied to Samples from Small Scale Treatment Systems,
W81-00631 5A

A Variable-Discharge Model for Facultative Oxidation Ponds,
W81-00680 5D

Feasibility of Purification and Concentration of Selected Wastewater Streams by Ultrafiltration,
W81-00701 5D

Method for Breaking an Oil-in-Water Emulsion,
W81-00711 5D

Method of Lowering the Color of Effluent Which Contains Aryl Azo- or Arly Nitro-Containing Compounds,
W81-00712 5D

Method and Device for Removing Solid and/or Liquid Means Containing Harmful Substances,
W81-00713 5G

Kraft Pulp Bleaching and Recovery Process,
W81-00718 5D

Sewage Treatment,
W81-00719 5D

Process and Apparatus for Dewatering Granulated Material, Especially Granulated Blast Furnace Slag,
W81-00720 3E

Combination of a Biological Dry Toilet and a Biological Waste Water Purifying Plant,
W81-00723 5D

Characteristic Evaluation of Trickling Filter Process,
W81-00732 5D

Evaluation of Ozone Induced Biodegradability of Wastewater Treatment Plant Effluent,
W81-00746 5D

WASTEWATER TREATMENT
Study of the Potential for Water Reuse in the Steel Industry,
W81-00513 3E

Filtration System for Household Sewage,
W81-00526 5D

WATER ANALYSIS
Exchange of Comments on Scheme for Classification of Heavy Metal Species in Natural Waters,
W81-00599 5A

Determination of Alpha-Chloroacetanilides in Water by Gas Chromatography and Infrared Spectrometry,
W81-00601 7B

Interlaboratory Comparison of Determinations of Trace Level Hydrocarbons in Mussels,
W81-00602 5A

WATER BALANCE
Estimated Inflow and Evaporation for Great Salt Lake, Utah, 1931-76, with Revised Model for Evaluating the Effects of Dikes on the Water and Salt Balance of the Lake,
W81-00658 2H

WATER-BEARING FORMATIONS
Structure Contour Map of the Madison Group, Havre 1 Degree by 2 Degree Quadrangle, North-Central Montana,
W81-00652 7C

Structure Contour Map of the Top of the Madison Group, Great Falls 1 Degree by 2 Degree Quadrangle, North-Central Montana,
W81-00653 7C

Structure Contour Map of the Top of the Madison Group, Shelby 1 Degree by 2 Degree Quadrangle, North-Central Montana,
W81-00654 7C

Structure Contour Map of the Top of the Madison Group, Lewistown 1 Degree by 2 Degree Quadrangle, North-Central Montana,
W81-00655 7C

WATER CONSERVATION
Study of the Potential for Water Reuse in the Steel Industry,
W81-00513 3E

Water Conservation on the Upper Missouri and Mississippi Rivers Through Thermal Standards Modifications,
W81-00695 3E

WATER COSTS
The Future of Agricultural Water Use in New Mexico,
W81-00643 6D

Agricultural Water Use and Costs in California,
W81-00644 3F

WATER DEMAND
An Analysis of Residential Water Demand Schedules in Arkansas,
W81-00690 6D

WATER DISTRIBUTION (APPLIED)
Cross-Connection Control Means Potable Water Safety.
W81-00589 5G

WATER DISTRICTS
How to Keep Ahead of the Regulators,
W81-00590 6E

WATER LAW
The New Regulatory Constraints: From Conflict toward Compromise,
W81-00591 6E

The Effect of San Francisco's Wastewater Plan on Water Quality and Aquatic Biology,
W81-00647 5F

Efficient Government Institution for Water Quality Control,
W81-00648 6E

Reclamation Law, Water Districts, and Politics in the Kings River Service Area of California - An Alternative Framework for Analysis,

Institutional and Legal Prescription of Water Use and Management,
W81-00678 6E

WATER LEVEL FLUCTUATIONS
Records of Ground-Water Recharge and Discharge, 1934-78; Water Levels, 1975-78; and Chemical Quality of Water, 1977-78, for the Edwards Aquifer in the San Antonio Area, Texas.
W81-00668 2F

WATER MANAGEMENT (APPLIED)
Management of the Hydrologic System in Areas Subject to Coal Mining Activities,
W81-00502 5G

WATER POLICY REGULATION
Threading the Regulatory Maze: A Small Utility's View,
W81-00595 6E

WATER POLLUTION
Chlorinated Paraffins and the Environment. 1. Environmental Occurrence,
W81-00577 5B

Agricultural Area Impacts within a Natural Area: Cades Cove, a Case History,
W81-00612 5C

Preliminary Observations on the Benthic Macroinvertebrate Communities of Ross Bay, a Polluted Area of Lough Leane, South-West Ireland,
W81-00634 5C

An Investigation Into the Long-Term Effects of Rhine Water on Rainbow Trout,
W81-00743 5C

An Ecological Risk Index for Aquatic Pollution Control. A Sedimentological Approach,
W81-00747 5C

WATER POLLUTION CONTROL
Study of the Potential for Water Reuse in the Steel Industry,
W81-00513 3E

Implementation of the Control of Pollution Act, 1974,
W81-00579 6E

Efficient Government Institution for Water Quality Control,
W81-00648 6E

WATER POLLUTION EFFECTS
Concordance of Heavy Metal and Antibiotic Resistance on Plasmids of Chesapeake Bay Bacteria,
W81-00508 5C

Anthropogenic Influence of the Sedimentary Regime of an Urban Estuary - Boston Harbor,
W81-00519 2L

Saving the Lakes,
W81-00549 2H

WATER POLLUTION SOURCES
Chlorinated Paraffins and the Environment. 2. Aquatic and Avian Toxicology,
W81-00578 5C

An Empirical Kinetic Model of Trihalomethane Formation: Applications to Meet the Proposed THM Standard,
W81-00596 5F

Aluminum Pollution and Fish Toxicity,
W81-00619 5C

Status Report on Abatement of Water Pollution From the Canadian Pulp and Paper Industry (1978).
W81-00703 5G

WATER POLLUTION TREATMENT
Filtration System for Household Sewage,
W81-00526 5D

Two Zone Process for Biological Treatment of Waste Water,
W81-00528 5D

Process and Apparatus for the Biological Treatment of Waste Water,
W81-00529 5D

Liquid Clarification System,
W81-00531 5D

Ferrite Flocculating System,
W81-00533 5D

Wastewater and Wastewater Solid Processing System,
W81-00534 5D

Apparatus for Clarifying Liquid,
W81-00535 5D

Saving the Lakes,
W81-00549 2H

Oily Effluent Treatment by the BP Treatment Process,
W81-00581 5D

Method for Breaking an Oil-in-Water Emulsion,
W81-00711 5D

Method of Lowering the Color of Effluent Which Contains Aryl Azo- or Arly Nitro-Containing Compounds,
W81-00712 5D

Method and Device for Removing Solid and/or Liquid Means Containing Harmful Substances,
W81-00713 5G

Pleated Filter Underdrain, Method and Apparatus,
W81-00721 5G

Combination of a Biological Dry Toilet and a Biological Waste Water Purifying Plant,
W81-00723 5D

WATER PURIFICATION
Flushing System for Reverse Osmosis Water Purification Units,
W81-00525 5F

Feasibility of Purification and Concentration of Selected Wastewater Streams by Ultrafiltration,
W81-00701 5D

Apparatus for Emergency Water Purification,
W81-00722 5F

Concentration of Impurities by Progressive Freezing,
W81-00731 5D

Effluent Treatment and Algae Recovery by Ozone-Induced Flotation,
W81-00744 5D

WATER QUALITY
Phosphorus Management for the Great Lakes.
W81-00511 5G

Water Resources Research Needs in New England,
W81-00548 6E

Saving the Lakes,
W81-00549 2H

Effects of Bank Stabilization on the Physical and Chemical Characteristics of Streams and Small Rivers: an Annotated Bibliography,
W81-00557 4D

Effects of Bank Stabilization on the Physical and Chemical Characteristics of Streams and Small Rivers: A Synthesis,
W81-00559 4D

Effects of Nutrients on Algal Growth in Waters of the Canberra Region and Related Control Measures,
W81-00586 5C

Effects of Urban Runoff and Treated Municipal Wastewater on a Man-Made Channel in Northeastern Illinois,
W81-00626 5C

The Future of Agricultural Water Use in New Mexico,
W81-00643 6D

RVRFLO: A Hydraulic Simulator of Water Quality in the Housatonic River in Connecticut,
W81-00651 5B

Water Resources Data for Massachusetts and Rhode Island, Water Year 1979.
W81-00656 7C

Reconnaissance of Chemical Quality of Surface Water and Fluvial Sediment in the Dirty Devil River Basin, Utah,
W81-00659 2K

Analysis of Stream Quality in the Yampa River Basin, Colorado and Wyoming,
W81-00660 5B

Water Quality of Tampa Bay, Florida: June 1972 - May 1976,
W81-00662 5A

Dissolved-Solids Concentrations and Loads in Return Flows to the Colorado River from Agricultural Land in Southern California,
W81-00664 5B

Records of Ground-Water Recharge and Discharge, 1934-78; Water Levels, 1975-78; and Chemical Quality of Water, 1977-78, for the Edwards Aquifer in the San Antonio Area, Texas.
W81-00668 2F

Water Resources Data for Colorado, Water Year 1979--Volume 1. Missouri River Basin, Akansas River Basin, and Rio Grande Basin.
W81-00669 7C

Water Resources Data for Colorado, Water Year 1979--Volume 2. Colorado River Basin above Dolores River.
W81-00670 7C

Water Resources Data for Colorado, Water Year 1979--Volume 3. Dolores River Basin, Green River Basin, and San Juan River Basin.
W81-00671 7C

Water Quality Aspects of Coal Transportation by Slurry Pipeline,
W81-00673 5B

In-Situ Evaluation of the Filtering Function of a Piedmont Creek Swamp,
W81-00677 5B

Seventh Annual Report: Great Lakes Water Quality.
W81-00702 5D

Urban Runoff Pollution and Water Quality Planning,
W81-00705 5B

WATER QUALITY

Sensory Properties and Analysis of Two Muddy Odour Compounds, Geosmin and 2-Methylisoborneol, in Water and Fish,
W81-00748 5A

WATER QUALITY CONTROL
Apparatus for Filter Backwashing,
W81-00522 5G

Treatment of Aqueous Systems,
W81-00523 5G

Laboratory Application of Secondary Sewage Effluent to Argillaceous Limestone,
W81-00641 5D

Institutional Problems of Water Quality Planning (Section 208) in Urbanizing Areas,
W81-00672 6E

The Development of Chlorine Resistant Ultrathin Film Composite Membranes from Soluble Aromatic Polyimide Thin Films on Polybutylene Terephthalate Supports,
W81-00679 5D

WATER QUALITY STANDARDS
Water Conservation on the Upper Missouri and Mississippi Rivers Through Thermal Standards Modifications,
W81-00695 3E

WATER RATES
Designing Equitable Water Rates: What Managers Need Know,
W81-00593 6C

Industrial Surcharges that Industry Likes,
W81-00607 5F

WATER REQUIREMENTS
Water Requirements and Costs for South Dakota Rural Manufacturing Firms,
W81-00550 6B

WATER RESOURCES
Water Resources Research Needs in New England,
W81-00548 6E

Involving the Public in Water and Power Resources Decisions,
W81-00558 6A

Five Year Plan of Water Resources Research and Development for Connecticut,
W81-00675 6E

Five-Year Research Plan,
W81-00683 6E

A Five Year Water Research Plan for the State of Arkansas,
W81-00693 6E

Five-Year Water Resources Research and Development Plan: Fiscal Years 1982-1986.
W81-00694 6E

Regional Five-Year Water Research and Development Goals and Objectives.
W81-00699 6E

Water Resources Research Program: Five-Year Projection (1982-1986), Pennsylvania Water Resources Research Center,
W81-00700 6E

WATER RESOURCES DEVELOPMENT
Basin Development and Water Allocation,
W81-00514 6A

Promising Methodologies for Fish and Wildlife Planning and Impact Assessments,
W81-00565 6G

The New Regulatory Constraints: From Conflict toward Compromise,
W81-00591 6E

Explorations in Multiobjective Water Resource History,
W81-00674 6B

1982-1986 Research and Development Plan for Florida Water Resources Research Center,
W81-00684 6E

Assessment and Recommendations for Community Water Resources Planning.
W81-00696 6B

WATER RESOURCES PLANNING
Environmental Assessments in Water Resources Planning,
W81-00704 6B

WATER REUSE
Study of the Potential for Water Reuse in the Steel Industry,
W81-00513 3E

Process and Apparatus for Dewatering Granulated Material, Especially Granulated Blast Furnace Slag,
W81-00720 3E

WATER RIGHTS
Basin Development and Water Allocation,
W81-00514 6A

Reclamation Law, Water Districts, and Politics in the Kings River Service Area of California - An Alternative Framework for Analysis,
W81-00650 6E

WATER SAMPLING
A Laboratory Data-Processing System,
W81-00575 7C

Effect of Mild Tannery Pollution on Growth and Emergence of Two Aquatic Insects Rhithrogena Semicolorata and Emphemerella Ignita,
W81-00741 5C

WATER SUPPLY
Direct Filtration of Virginia Surface Waters: Feasibility and Costs,
W81-00501 5F

Reasonable Ground Water Pumping Levels Under the Appropriation Doctrine: Law, Policy and Alternatives,
W81-00510 6E

Water Resources Research Needs in New England,
W81-00548 6E

Water Requirements and Costs for South Dakota Rural Manufacturing Firms,
W81-00550 6B

Freshwater Use Customs on Rota: An Exploratory Study.
W81-00640 7C

WATER TABLE
Reasonable Ground Water Pumping Levels Under the Appropriation Doctrine: Law, Policy and Alternatives,
W81-00510 6E

WATER TEMPERATURE
Analysis of Stream Quality in the Yampa River Basin, Colorado and Wyoming,
W81-00660 5B

WATER TREATMENT
Direct Filtration of Virginia Surface Waters: Feasibility and Costs,
W81-00501 5F

Apparatus for Filter Backwashing,
W81-00522 5G

Treatment of Aqueous Systems,
W81-00523 5G

Ion Exchange Method and Apparatus,
W81-00524 5G

Flushing System for Reverse Osmosis Water Purification Units,
W81-00525 5F

The Effects of Permanganate Pretreatment on Trihalomethane Formation in Drinking Water,
W81-00570 5F

How to Keep Ahead of the Regulators,
W81-00590 6E

Improved Method Generates More Chlorine Dioxide,
W81-00610 5F

Optimizing Water Treatment Plant Operations for Savings of Water, Energy, and Chemicals,
W81-00686 5F

Apparatus for Emergency Water Purification,
W81-00722 5F

WATER USE
Institutional and Legal Prescription of Water Use and Management,
W81-00678 6E

WATER YIELD
Records of Ground-Water Recharge and Discharge, 1934-78; Water Levels, 1975-78; and Chemical Quality of Water, 1977-78, for the Edwards Aquifer in the San Antonio Area, Texas.
W81-00668 2F

WATERSHED MANAGEMENT
Ecological Comparison of Intermittent Streams in Different Land Use Patterns in Northeastern Illinois,
W81-00645 2E

WATERSHEDS (BASINS)
Factors Influencing Viable Bacteria in a Turbid Man-Made Impoundment.
W81-00733 2H

WAYNE COUNTY (UT)
Aquifer Tests of the Navajo Sandstone Near Caineville, Wayne County, Utah,
W81-00657 2F

WELFARE (ECONOMICS)
Water as a Parameter for Development of Energy Resources in the Upper Great Plains -- Socioeconomic Effects of Alternative Patterns of Coal-Based Energy Development,
W81-00692 6B

WELLS
In-Ground Precipitation Ends Wellscreen Plugging,
W81-00588 5G

WEST VIRGINIA
Predicting Normal Mimimum-Flow Rates for Ungaged Streams in West Virginia,
W81-00685 2E

WILDLIFE
Playa Lakes Characterization Study,
W81-00554 2H

Impacts of Uranium Mining and Milling Upon the Fish and Wildlife Resources of the New Mexico San Juan Basin Region,
W81-00555 5C

WILDLIFE HABITATS
Promising Methodologies for Fish and Wildlife Planning and Impact Assessments,
W81-00565 6G

YAMPA RIVER BASIN (CO-WY)
Analysis of Stream Quality in the Yampa River Basin, Colorado and Wyoming,
W81-00660 5B

AUTHOR INDEX

SELECTED WATER RESOURCES ABSTRACTS

VOLUME 14, NUMBERS 5 & 6
MARCH 15, 1981

W81-00751 -- W81-01000
CODEN: SWRABW

SELECTED WATER RESOURCES ABSTRACTS (SWRA) is produced by the Office of Water Research and Technology, U.S. Department of the Interior, and published twice monthly by the National Technical Information Service (NTIS), U.S. Department of Commerce.

SWRA is available to Federal agencies and their contractors or grantees in water resources research upon request, citing contract or grant number and sponsoring agency. Write: Office of Water Research and Technology, U.S. Department of the Interior, Washington, DC 20240. The **SWRA Journal** is also available on subscription from NTIS, 5285 Port Royal Road, Springfield, VA 22161. Annual subscription rates for the North American Continent are: Journal only, $100; Journal and Annual Indexes, $125; Indexes only, $50. Other addressees, write for prices.

Some documents abstracted in this journal can be purchased from NTIS. Price codes are given in the entries and a current code-price conversion table is printed on the outside back cover. Other documents are available from originating organizations or authors as indicated in the citation.

Notice to Subscribers

The input system within the Office of Water Research and Technology, U.S. Department of the Interior, is undergoing transition. This action has temporarily reduced the number of reports available for announcement.

Volume 14, Numbers 5 and 6 are combined in this issue. Some future issues may also be combined until normal input flow is resumed.

SELECTED WATER RESOURCES ABSTRACTS

A semimonthly publication of the Office of Water Research and Technology,
U.S. Department of the Interior

VOLUME 14, NUMBERS 5 & 6
MARCH 15, 1981

W81-00751 -- W81-01000

The Secretary of the Interior has determined that the publication of the periodical is necessary in the transaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1983.

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

PREFACE

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. These documents cover water resources as treated in the life, physical, and social sciences and the related engineering and legal aspects of the characteristics, supply condition, conservation, control, use, or management of water resources. Each abstract includes a full bibliographic citation and a set of descriptors which are listed in the **Water Resources Thesaurus.** The abstract entries are classified into 10 fields and 60 groups similar to the water resources research categories established by the Committee on Water Resources Research of the then Federal Council for Science and Technology.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several services of the Office of Water Research and Technology. The cumlative SWRA file from 1968 and montlhy updates are available also in magnetic tape through lease from NTIS.

THE OFFICE OF WATER RESEARCH AND TECHNOLOGY DOES NOT PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Comments and suggestions concerning the contents and arrangement of this bulletin are welcome.

CONTENTS

SUBJECT FIELDS AND GROUPS

Please use the edge index on the back cover to locate Subject Fields and Indexes.

01 NATURE OF WATER

Includes the following Groups: Properties; Aqueous Solutions and Suspensions.

02 WATER CYCLE

Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION

Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL

Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Nonwater Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION

Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING

Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA

Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS

Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES

Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION

Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

STUDIES DIRECTED TOWARD COUPLING AN ENERGY BALANCE SNOWMELT MODEL TO A STREAMFLOW RUNOFF MODEL,
California Univ., Santa Barbara. Computer Systems Lab.
J. Dozier, R. Davis, M. Frampton, J. Frew, and B. Marks.
1980 Final Technical Report for University of California Water Resources Center, Davis, California. Grant W-546. 173 p, 35 Fig, 12 Tab, 162 Ref.

Descriptors: *Snowmelt, *Runoff, *Streamflow, Model studies, Snowpacks, Snow cover, Micrometeorological instrumentation, Alpine regions, Snow hydrology, *Energy budget, Mathematical modelling, Remote sensing, Solar radiation, California, Alpine climatology, Watersheds, Stream forecasts, Satellite radiometry, Albedo, Irradiance.

Snowmelt models using the energy balance approach do not rely on statistical relationships and can thus provide reliable data on melt rates even during extremes such as drought or flood. If properly coupled to a streamflow model, an energy balance snowmelt model driven by calibrated satellite data can improve the short-term prediction of spring runoff during extreme snow years. Six papers describe: (1) A clear-sky spectral solar radiation model calculating incident, net, or reflected solar radiation at any point on a snow surface in mountainous terrain if point albedos are known; (2) Measurement of vegetation densities and analysis of the effect of varying canopy densities on irradiance received at the surface contributing to an accurate model of radiation exchange at the snow surface over a large alpine area; (3) Thermal satellite data used to develop an areal simulation of the surface energy budget of an alpine snowcover; (4) Digital terrain information and numerical atmospheric models combined with spaceborne radiance measurements to compute a surface albedo for any given terrain location; (5) A micro-meteorological station in the southern Sierra Nevada contributing to the testing and development of an energy balance snowmelt model by providing undisturbed measurements of energy exchange components, snow mass balance, and snow and soil properties; (6) Measurements of the heat and mass transfer across air-snow and soil-snow interfaces to compute the melt rates and magnitudes from a snowpack. HIGH WATER LEVELS IN GROUND-WATER DOMINANT LAKES--A CASE STUDY FROM NORTHWESTERN WISCONSIN,
Residuals Management Technology, Inc., Madison, WI.
M. B. Rinaldo-Lee, and M. P. Anderson.
Ground Water, Vol 18, No 4, p 334-339, July-August, 1980. 5 Fig, 1 Tab, 14 Ref. OWRT A-075-WIS(3).

Descriptors: *Wisconsin, *Surface-groundwater relationships, *Water level fluctuations, *Lakes, *Groundwater, Aquifers, Water table, On-site data collections, Computer models, Model studies, Precipitation(Atmospheric), Groundwater movement, Piezometers, Reservoirs, Flow nets, Potentiometric level, Observation wells, Groundwater recharge.

An investigation into the cause of high lake levels during the early 1970s in a groundwater dominant lake in northwestern Wisconsin was conducted from December 1976 to July 1978, in part to address allegations by shoreline property owners that regulation of water levels in a reservoir 2.4 km south of the lake had caused the high lake levels. High lake levels also coincided with above average precipitation. Data collected during the study allowed the definition of the groundwater flow system around the lake and the calculation of the water budget for the lake. Field data indicated that there is no groundwater flow between the reservoir and the lake and that groundwater flowing out of the reservoir is intercepted by a trough in the potentiometric surface. The trough is probably oriented along a permeable fault zone or a buried river valley. A groundwater flow model was used to determine whether increased recharge rates of the magnitude that probably occurred as a result of above average precipitation in the early 1970s would be sufficient to account for the observed rise in lake level or whether regulation of the water level in the reservoir could be expected to affect lake level. (Visocky-ISWS)

2B. Precipitation

PRACTICAL CONSIDERATIONS IN THE APPLICATION OF SURFACE FITTING TECHNIQUES FOR ESTIMATIONS OF AREAL RAINFALL,
Natal Univ., Pietermaritzburg (South Africa). Dept. of Agricultural Engineering.
R. E. Schulze.
In: Preprint Volume, Tenth Conference on Severe Local Storms, October 18-21, 1977, Omaha, Nebraska, p 104-109, 1977. 5 Fig, 1 Tab, 16 Ref. American Meteorological Society, Boston, Massachusetts.

Descriptors: *Mathematical studies, *Rainfall, *Distribution patterns, *Estimating, *Water resources, Least squares method, Evaluation, Rain gages, Simulated rainfall, Precipitation(Atmospheric), Sampling, Gaging stations, Geomorphology, Drainage density, Hydrogeology, Runoff, Watersheds(Basins), Topography, Altitude, Planning, Maps, Mountains, Forecasting, South Africa.

Trend surface analysis of point and areal rainfall in the mountainous Drakensburg area, South Africa, was evaluated for accuracy and used to estimate water resources in the region. The technique is essentially an application of the least squares theory and the physiographic factors such as altitude yield and the adequacy of the rainage network in the area must be included in the analysis for meaningful results. These 4-dimensional hypersurfaces give more realistic rainfall patterns than 3-dimensional surfaces. More improvement in the rainfall maps can be made if the longitudinal and latitudinal grid is aligned with major trends. A comparison of rainfall surfaces and residuals of a small catchment at Cathedral Peak with the Drakensberg area indicated rainfall anomalies associated with local topography. The presence or absence of key stations, especially in peripheral and isolated high altitude stations, can significantly alter rainfall estimations. Supression of variables in order to normalize them in respect to other variables does not improve the analysis. High order polynomials should not be used if the gaging network is incomplete, otherwise erroneous results are obtained. Trend surface analysis of physiographic-dependent rainfall data is an extremely useful tool for water resource planning if coupled with an adequate rainage network. (Sidney-IPA)

RIPARIAN HABITAT AND INSTREAM FLOW STUDIES, LOWER VERDE RIVER: FORT MCDOWELL RESERVATION, ARIZONA,
Fish and Wildlife Service, Albuquerque, NM.
R. M. McNatt, R. J. Hallock, and A. W. Anderson.
Report, June, 1980. 58 p, 16 Fig, 8 Tab, 50 Ref, 1 Append.

Descriptors: *Streamflow, *Fish populations, *Riparian plants, *Cottonwoods, Arizona, Wildlife, Dams, Groundwater resources, Flow control, Aquatic habitats, Rainbow trout, Carp, Channel catfish, Sunfishes, Bass, Brown trout, Suckers, Minnows, Habitat improvement, Verde River.

The Fort McDowell reach of the Verde River in Arizona contains high quality riparian habitat which supports a wide variety of fish and wildlife species, and riparian vegetation. The riparian zone has value for recreation, flood control, groundwater recharge, bank stabilization, erosion control, honey production, livestock grazing, and fuel wood production. Weighted Usable Area (WUA) curves are provided for selected fishes (rainbow trout, carp, channel catfish, bluegill, green sunfish, largemouth bass) that commonly occur in the Fort McDowell Reach. WUA curves are also provided for brown trout, small mouth bass and white sucker (closely related to native suckers). WUA curves for adult rainbow and brown trout show maximum values at stream flows ranging from 200 to 300 cfs; other species, such as channel catfish and native suckers and minnows, would also be enhanced, if flows of this magnitude can be maintained. A high rate of mortality of cottonwood trees coincided with the 1977 drought, when water releases from Bartlet Dam were nearly eliminated. Tree mortality was greatest (60 to 84%) in the stream reach influenced by groundwater withdrawals by the City of Phoenix. It is recommended that a streamflow of at least 200 cfs be maintained along the Fort McDowell reach to maintain and enhance fish and wildlife resources and riparian habitat. (Moore-SRC)
W81-00756

ON THE ELEVEN-YEAR SOLAR CYCLE AND RIVER FLOW,
University of the Witwatersrand, Johannesburg (South Africa).
T. G. J. Dyer.
Water SA (Pretoria), Vol 4, No 4, p 157-160, 1978. 2 Fig, 3 Ref.

Descriptors: *Solar radiation, *River flow, *Dams, *Mathematical studies, *Climatology, *Time series analysis, Correlation anlysis, Africa, Flow, Rivers, Forecasting, Reliability.

Temporal ten-year patterns are shown in a theoretical study covering seven river flows (Zambezi, Okavango, Komati, Pongola, Mooi, Mzimkulu, Steenbras) and in-flows of three dams (Gaberone, Marico-Bosveld, Hartbeespoort), covering the length of South Africa for the intercomparison of flow fluctuations with the solar cycle. No simple relationship was found. In some cases, river flow and solar cycle were in-phase, in other cases they were in anti-phase while in others there were periods of in-phase followed by an abrupt discontinuity leading to anti-phase. It is concluded that an hypothesis of no relationship between river flow and the solar cycle could not be accepted, and further study is recommended. (Zielinski-IPA)
W81-00778

2F. Groundwater

ESSENTIALS OF GROUND-WATER HYDROLOGY PERTINENT TO WATER-RESOURCES PLANNING,
Water Resources Council, Washington, D. C. Hydrology Committee.
Available from Supt. of Documents, GPO, Washington, DC 20402. Bulletin 16 (revised), 1980. 45 p, 6 Fig, 1 Tab, 68 Ref.

Descriptors: *Groundwater resources, *Hydrology, *Planning, Model studies, Water resources, Decision making, Water management(Applied), Aquifers, Surface-groundwater relationships.

With current emphasis on regional and river basin planning for water and related land resources, and increased emphasis on environmental protection and management, it is important that ground water be investigated as a basic element of water supply to determine its availability and utility within local-

ized areas and to consider its broader role in regionwide water resources planning and management. Well-established fundamental principles of groundwater behavior and a fund of descriptive knowledge of the groundwater reservoirs, coupled with recent advances in investigative and analytical methods of groundwater hydrology, provide firm footing for improved planning for management of the resource. Modeling methods constitute powerful tools for prediction of the effects of groundwater withdrawals and for the design of rational programs of management and protection. Incorporating groundwater into water systems management and into broader land and water programs is both feasible and practical. (Moore-SRC)

A COMPARISON OF ANALOG AND DIGITAL MODELING TECHNIQUES FOR SIMULATING THREE-DIMENSIONAL GROUNDWATER FLOW ON LONG ISLAND, NEW YORK,
Geological Survey, Syosset, NY. Water Resources Div.
T. E. Reilly, and A. W. Harbaugh.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-226095, Price codes: A03 in paper copy, A01 in microfiche. Geological Survey Water-Resources Investigations 80-14, 1980. 40 p, 16 Fig, 2 Tab, 18 Ref.

Descriptors: *Analog models, *Digital computers, *Model studies, *Numerical analysis, Analytical techniques, Groundwater movement, Hydraulic conductivity, Hydrogeology, Aquifer characteristics, Water storage, Water table, Regional analysis, New York, *Long Island(NY), Finite-difference method.

A three-dimensional electric-analog model of the Long Island, NY, groundwater system constructed by the U.S. Geological Survey in the early 1970's was used as the basis for developing a digital, three-dimensional finite-difference model. The digital model was needed to provide faster modifications and more rapid solutions to water-management questions. Results generated by the two models are depicted as potentiometric-surface maps of the upper glacial and Magothy aquifers. Results compare favorably for all parts of Long Island except the northwestern part, where hydrologic discontinuities are most prevalent and which the two models represent somewhat differently. The mathematical and hydrologic principles used in development of ground-water models, and the procedures for calibration and acceptance, are presented in nontechnical terms. (USGS)

2H. Lakes

THE CHEMICAL AND BIOLOGICAL EFFECTS OF ANNUAL DIEBACK OF MYRIOPHYLLUM SPICATUM L. AND THE IMPORTANCE RELATIVE TO NUTRIENT CYCLING IN MONROE RESERVOIR, MONROE CO., INDIANA,
Indiana Univ. at Bloomington. Dept. of Biology.
D. H. Landers.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-142986, Price codes: A07 in paper copy, A01 in microfiche. Doctor of Philosophy Thesis, 1979. 129 p, 20 Fig, 15 Tab, 70 Ref, 1 Append. OWRT-B-099-IND(2).

Descriptors: *Myriophyllum spicatum, *Nitrogen, *Phosphorus, *Cycling nutrients, *Senescence, Lakes, Standing crops, Environmental effects, Nutrients, Phytoplankton, Chlorophyll, Aerial photography, Evaluation, *Monroe Reservoir(IN).

Enclosures (2-m diameter) were placed in the littoral zone of Monroe Reservoir, Monroe Co., Indiana, to evaluate the chemical and biological effects of late summer dieback of Myriophyllum spicatum. Aerial photography, combined with quadrat sampling, was used to measure the standing crop at peak summer biomass. Plant tissue analysis was applied to total biomass estimates to determine potential N and P release from senescing macrophytes. At the time of dieback, considerable pulses of SRP, HN3-N and N03-N were detected in the enclosures containing plants and in the adjacent open-water sites. These nutrient inputs were associated with episodes of normal macrophyte senescence and decay. Chlorophyll a increased greatly in response to these nutrient inputs, indicating important increases in phytoplankton production as a direct consequence of macrophyte dieback. Crashing autumn phytoplankton populations were responsible for additional pulsed inputs of SRP, NH3-N and N03-N in enclosed and open-water locations. Realized nutrient inputs from senescent M. spicatum are estimated to represent as much as 20% of the annual P. budget, and not more than 2.2% of the annual N. budget for the reservoir.

PENETRATION OF SOLAR RADIATION IN SNOW-ICE COVERED WATER RESERVOIRS: WINTERKILL,
Missouri Water Resources Research Center, Rolla.
A. L. Crosbie, and W. Davidson.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-149643, Price codes: A06 in paper copy, A01 in microfiche. Completion Report, November 28, 1980. 118 p, 14 Fig, 17 Ref, 2 Append. OWRT-A-113-MO(1), 14-34-0001-9027 & 0127.

Descriptors: *Model studies, *Winterkilling, *Aquatic life, Forecasting, *Iced lakes, *Solar radiation, Ice cover, Reservoirs, Light penetration, Light intensity, Reflectance, Optical properties, Albedo, Snow cover.

A snow-ice covered water reservoir is modeled by two absorbing-scattering planar layers. The scattering centers in the snow layer are assumed to be ice spheres, while the scattering centers in the ice layer are assumed to be spherical voids. The scattering characteristics of each layer are predicted by Mie theory. A Dirac-delta function approximation to the scattering phase function is introduced to simplify the analysis and account for strong forward scattering due to diffraction. An invariant imbedding solution technique is then used to solve the transport equation including multiple scattering for the penetration of solar radiation through the snow-ice layer. Both collimated and diffuse solar radiation are considered. The results show good agreement between the isotropic and anisotropic approximations except at large incident angles and small depths. The penetration of solar radiation is strongly dependent on the asymmetry factor, single scattering albedo and optical thickness of the snow layer. Simplified expressions valid for large optical depths are presented. The reflection of solar radiation is also predicted. The results of this investigation should help predict winterkill (the suffocation of aquatic animal life in the winter months).

2I. Water In Plants

IMPACT OF WATER LEVEL CHANGES ON WOODY RIPARIAN AND WETLAND COMMUNITIES, VOLUME VII, MEDITERRANEAN REGION , WESTERN ARID AND SEMI-ARID REGION,
Missouri Univ., Columbia. School of Forestry, Fisheries and Wildlife.
M. A. Walters, R. O. Teskey, and T. M. Hinckley.
Fish and Wildlife Service, Office of Biological Services, Report FWS/OBS-78/93, July 1980. 90 p, 19 Fig, 6 Tab, 47 Ref. USDI 92365-0110.

Descriptors: *Riparian plants, *Water level fluctuations, *Arid lands, Semiarid climates, Wetlands, Trees, Shrubs, Floods, Droughts, Seasonal, Arizona, New Mexico, California, Utah, Nevada, Idaho, Washington, Oregon, Groundwater.

This literature review synthesizes existing information on the effect of water level changes on woody plants found in riparian and wetland communities in the Mediterranean, Western Arid and Semi-arid Regions. These regions cover Arizona, New Mexico, California, Utah, Nevada, southern Idaho, eastern Washington and Oregon. In addition, the effect of drought on woody plants of these regions is described. Riparian vegetation is normally exposed to high groundwater levels as well as to periods of excess water due to flooding. The effect of excess water often causes stress to the plant resulting in decreased growth or even death. A plant's response to flooded conditions depends on many factors, including the species tolerance, water level, duration of flooding and time of year. Available information for individual species of the region is listed in a tabular format. (Moore-SRC)

INPUT AND EARLY DIAGENESIS OF CHLOROPHYLLS IN A TEMPERATE INTERTIDAL SEDIMENT,
Melbourne Univ., Parkville (Australia), Dept. of Organic Chemistry.
F. T. Gillan, and R. B. Johns.
Marine Chemistry, Vol 9, No 4, p 243-253, August, 1980. 2 Fig, 4 Tab, 19 Ref.

Descriptors: *Chlorophyll, *Diagenesis, *Intertidal areas, *Sediments, Coasts, Temperate, Australia, Diatoms, Degradation(Decomposition), Stability, Sampling, Algae, Cores.

The initial steps of chlorophyll-a decomposition in temperate sandy intertidal sediment samples from a low-energy coastline of Corner Inlet, SE Victoria were examined. Diatom input into the surface layers was noted as the major source of chlorophyll-a. In the study area, relative stabilities were chlorophyll-a > chlorophyllide-C2 > chlorophyllide-C1. Chlorophyll-b was present only in trace quantities and was observed to be stable down to 10 mm in depth. In the upper sedimentary layers, bacteriochlorophyll-a and bacteriopheophytin-a levels were found to be stable throughout the

depth profile and inversely proportional to one another. Depth profile results on chlorophyll-a derivatives including pheophytin-a gave no evidence that these compounds were intermediates of chlorophyll-a degradation in the environment examined. With greater depth, further degradation of chlorophyll-a to colorless products occurred, presumably in intact algal cells. (Geiger-FRC)

2K. Chemical Processes

THE EFFECT OF DISSOLUTION OF VOLCANIC GLASS ON THE WATER CHEMISTRY IN A TUFFACEOUS AQUIFER, RAINIER MESA, NEVADA,
Geological Survey, Lakewood, CO. Water Resources Div.
A. F. White, H. C. Claassen, and L. V. Benson.
Available from Supt. of Documents, GPO, Washington, DC 20402, Price, $2.25. Geological Survey Water-Supply Paper 1535-Q, 1980. 34 p, 11 Fig, 5 Tab, 36 Ref.

Descriptors: *Water chemistry, *Geochemistry, Hydrogeology, Aquifer characteristics, *Groundwater movement, Chemical reactions, Kinetics, Rhyolites, Zeolites, Ion exchange, Adsorption, Nevada, *Volcanic glass, *Tuffaceous rocks, *Rainier Mesa(NV), Nevada test site.

Geochemistry of ground water associated with the Tertiary tuffs within Rainier Mesa, southern Nevada, was investigated to determine the relative importance of glass dissolution in controlling water chemistry. Water samples were obtained both from interstitial pores in core sections and from free-flowing fractures. Cation compositions showed that calcium and magnesium decreased as a function of depth in the mesa, as sodium increased. The maximum effect occurs within alteration zones containing clinoptilolite and montmorillonite, suggesting these minerals effectively remove bivalent cations from the system. Comparisons are made between compositions of ground waters found within Rainier Mesa that apparently have not reacted with secondary minerals and compositions of waters produced by experimental dissolution of vitric and crystalline tuffs which comprise the principal aquifers in the area. The two tuff phases have the same bulk chemistry but produce aqueous solutions of different chemistry. Rapid parabolic dissolution of sodium and silica from, and the retention of potassium within, the vitric phase verify previous predictions concerning water compositions associated with vitric volcanic rocks. Parabolic dissolution of the crystalline phase results in solutions high in calcium and magnesium and low in silica. Extrapolation of the parabolic dissolution mechanism for the vitric tuff to long times successfully reproduces at comparable pH, cation ratios existing in Rainier Mesa ground water. Comparison of mass-transfer rates of the vitric and crystalline tuffs indicates that the apparent high glass-surface to aqueous-volume ratio associated with interstitial permeability may account for dominance of the glass reaction. QUANTIFYING THE EUTROPHICATION PROCESS: DIFFICULTIES CAUSED, FOR EXAMPLE, BY SEDIMENTS,
H. Golterman.
Progress in Water Technology, Vol 12, No 2, p 63-80, 1980. 5 Fig, 22 Ref.

Descriptors: *Eutrophication, *Lakes, *Rivers, *Limnology, Model studies, Sediments, Aquatic environment, Water chemistry, Water properties, Algal control, Algae.

Even though present day information regarding the processes of eutrophication and their outcome is not complete, initial steps must be taken toward maintaining water quality. Knowledge is presently available to provide practical guidance for policy makers. The limitations of the models presently available are reviewed. The relation between algal biomass or algal growth rate and nutrients may be described using two separate submodels. The first deals with the relation between nutrient input and nutrient concentration. The second deals with the relation between nutrient concentration and algal growth. The adsorption model and the loading plus algal biomass model may also be employed. While each of these models is acceptable for a particular circumstance, a much greater understanding of the background mechanisms must be attained before conceptual models can be generated. (Baker-FRC).

EUTROPHICATION IN RELATION TO THE LOAD OF POLLUTION,
Uppsala Univ. (Sweden). Inst. of Limnology.
T. Ahl.
Progress in Water Technology, Vol 12, No 2, p 49-61, 1980. 10 Fig, 1 Tab, 30 Ref.

Descriptors: *Eutrophication, *Limnology, *Precipitation(Atmospheric), *Nutrients, Oligotrophy, Water properties, Water quality, Lakes, Geomorphology, Soiltypes.

Eutrophication is defined as a process which leads to nutrient-rich conditions in a body of water, regardless of the biological effects of such enrichment. In most cases such an enrichment will lead to increased biological activity. However, in cases of toxic enrichment, the effect will be opposite. Increases in nutrient load can result from precipitation and atmospheric deposition, from the soil, or from sources related to man's activities. The geographic distribution of the wet fallout of total nitrogen is described for 1968-1969 and compared with 1958-1959. While the wet deposition of phosphorus is not as well known, some data are presented. The terrestrial contribution of undisturbed soil to nutrients in a lake is influenced by climate, type of soil, topography, and vegetation. Disturbances of soil can alter the contribution of the area to the nutrients in nearby lakes. Such disturbances would include the use of inorganic fertilizers, cultivation of soil and other activities. Point sources of nutrients to the water come from urban areas and result from discharge of untreated domestic sewage and other activities. The annual discharge of nitrogen from Swedish industry has been estimated at 10,400 tons. If the average N/P ratio in industrial waste water is 7.5, this would yield a phosphorus discharge of 1,500 tons/yr. Studies indicated that the difference between a nutrient load giving oligotrophic conditions and one giving eutrophic conditions is much greater than would be suggested by the total amounts of nutrients involved. THE APPLICATION OF AN ECOSYSTEM MODEL TO THE BRISTOL CHANNEL AND SEVERN ESTUARY,
Institute for Marine Environmental Research, Plymouth (England).
P. J. Radford, and I. R. Joint.
Water Pollution Control, Vol 79, No 2, p 244-254, 1980. 8 Fig, 7 Ref.

Descriptors: *Model studies, *Channels, *Estuaries, Aquatic ecosystems, Recycling, Nutrients, Environmental effects, Pollutants, On-site data collections, Monitoring, Data collections, Bristol channel, Severn estuary, England.

The formulation and application of the GEMBASE model, an ecosystem model describing the Bristol Channel and Severn Estuary, are presented. Research in the channel, data from the literature, and laboratory experiments were used to derive the model. The model showed that the riverine input of nutrients was not sufficient to support the observed primary production rate and that local nutrient recycling must occur. Nutrient regeneration studies in the Carmarthen Bay have commenced as a result of model information. GEMBASE will also be utilized to answer applied problems and to predict the consequences of building a tidal barrage on the channel ecosystem. Expansions on the model could be used to evaluate the effects of pollutants on the ecosystem where data on effects already exist. The hydrodynamic subsystem would simulate the distribution of any conservative pollutant and, if the relationship is known between a pollutant's concentration and its biological effect, the effect on the entire ecosystem could be simulated. Data collected from 1977 to 1981 on monitoring cruises in the British Channel will be used to validate the verified version of GEMBASE. (Geiger-FRC)

EFFECTS OF ALTERED FRESHWATER INFLOW ON ESTUARINE SYSTEMS,
Texas Univ. at Austin. Environmental Health Engineering Lab.
N. E. Armstrong.
In: Proceedings of the Gulf of Mexico Coastal Ecosystems Workshop, September 4-7, 1979, Port Aransas, Texas, Fore, P. L., and Peterson, R. D., Eds., Fish and Wildlife Service, Office of Environment, Report FWS/OBS-80/30, May, 1980, p 17-31. 6 Fig, 9 Ref. 14-16-0002-79-152.

Descriptors: *Estuaries, *Freshwater, *Inflow, *Water quality, Ecology, Flow, *Environmental effects, Salinity, Mathematical models, Productivity, Spatial distribution, Temporal distribution, Biota, Commercial fishing.

There are three critical elements in this framework for determining freshwater release needs for estuarine systems. The first is the determination of appropriate water quality levels needed to sustain the diversity and productivity of the bay system, particularly commercially important species. The second is the process or predictive basis by which the effects of spatial and temporal distributions of freshwater flows are determined. The third is the determination of the quality and scheduling of freshwater inflows. Studies have related inflows to biological changes in estuaries using the community approach, the population approach, and the individual approach. The method chosen for such studies should be a function of the data available for the analysis. By exercising mathematical models for the system being studied, freshwater inflows may be correlated with changes in water quality at any point. Using this information and estimates of freshwater inflows to the bay, the effects of changes in freshwater inflows can be determined. (Moore-SRC)

STUDIES OF FRESHWATER NEEDS OF FISH AND WILDLIFE RESOURCES IN NUECES-CORPUS CHRISTI BAYS, TEXAS,
Fish and Wildlife Service, Austin, TX.
N. A. Funicelli.
In: Proceedings of the Gulf of Mexico Coastal Ecosystems Workshop, September 4-7, 1979, Port Aransas, Texas, Fore, P. L., and Peterson, R. D., Eds., Fish and Wildlife Service, Office of Environment, Report FWS/OBS-80/30, May, 1980, p 97-102. 1 Tab, 4 Ref.

Descriptors: *Estuarine environment, *Inflow, *Freshwater, *Salinity, *Biota, Ecology, Texas, Wildlife, Development stages, Water chemistry, Fish, Nutrients, Water quality, Aquatic plants, Shellfish, Seasonal, Management, Sediments, Productivity, Seagrasses, *Nueces-Corpus Christi Bays(TX).

The proposed Choke Canyon Reservoir could adversely affect the productivity of the Corpus

Christi, Nueces estuarine system by reducing the inflows of fresh water, nutrients, and sediments. Plants were collected and production measured from September 1978 to June 1979 from 10 transects representative of the Nueces delta, Harbor Island and Mustang Barrier Island study areas. Dissolved nutrient parameters were monitored during diurnal sampling. Larval, post-larval, juvenile, and adult fish and shellfish were sampled at various stations in the seagrass beds. Physiochemical data were also collected at all stations. Live standing crop was highest during the late spring, summer, and early fall, and lowest during the winter months. Inorganic nutrient concentrations were typically higher in the Nueces Marsh than in the seagrass beds. Analysis of nutrient exchange data during the period October 1978 to June 1979 indicated that the net annual flow of all nutrients was into Nueces marsh. Analysis of fish data indicated decreased use of marsh habitat during the winter months. Preliminary study indicates that fresh water inflow management cannot be tied to salinity management in Nueces, Corpus Christi Bays. Fresh water inflow must be considered as a transport system for estuarine nutrients and a mechanism for flooding which allows optimum habitat utilization. (Moore-SRC)

3. WATER SUPPLY AUGMENTATION AND CONSERVATION

3A. Saline Water Conversion

THE INFLUENCE OF ACCELERATION AND FLOW ON CONCENTRATION POLARIZATION IN REVERSE OSMOSIS,
SRI International, Menlo Park, CA.
G. B. Andeen, and M. S. Colah.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-134926. Final Report to Office of Water Research and Technology, November, 1980. 167 p, 17 Fig, 3 Tab, 16 Ref, 1 Append. OWRT-C-80364-S(No 9462)(1), 14-34-0001-9462.

Descriptors: *Reverse Osmosis, *Boundary layers, *Centrifugation, *Desalination processes, Testing procedures, Mass transfer, Evaluation, Concentration polarization, Acceleration.

'Concentration polarization' is the buildup of enriched brine at the membrane surface during reverse osmosis desalination. The usual techniques for limiting the buildup involve diffusion and flushing. The tests show that acceleration, as in a centrifuge, also can control the concentration polarization. Acceleration forces act preferentially on the enriched, more dense brine, pulling it from the membrane surface. Acceleration can also control flow distribution and reduce fouling. Hollow-fiber reverse osmosis elements were operated in a continuous flow centrifuge up to 1000 g. Increased flow and quality of desalted water indicated reduced concentration polarization under acceleration or increased brine flow. The effective mass transfer coefficient for removal of salt from the membrane surface was changed as much by doubling the acceleration as by doubling the flushing flow. Use of acceleration would allow use of higher transport rate membranes. This, together with fouling reduction, may make use of centrifuges in reverse osmosis economically attractive.

3B. Water Yield Improvement

MASS AND HEAT TRANSFER IN A CIRCULAR TUBE WITH BIOFOULING,
Rice Univ., Houston. Dept. of Chemical Engineering.
J. P. Kirkpatrick, L. V. McIntire, and W. G. Characklis.
Water Research, Vol 14, No 2, p 117-127, February, 1980. 14 Fig, 26 Ref.

Descriptors: *Mass transfer, *Heat transfer, *Fouling, *Mathematical models, Laminar flow, Microorganisms, Heat, Heat flow, Temperature, Heat exchangers, Fluid mechanics, Thermodynamics, Pipelines.

A phenomenological model for development of biofilm in a circular tube is presented, and its effect on heat transfer is examined under conditions of both laminar flow and turbulent flow. With laminar flow, radial mass transfer takes place solely by molecular diffusion, and with turbulent flow it takes place by both molecular and convective diffusion. Determination of heat transfer involves equations analogous to those for mass transfer, except that heat produced in the biofilm is assumed to be negligible and that a fluid is held at a constant temperature outside the tube. The presence of biofilm was found to decrease heat transfer significantly in both laminar and turbulent flow. As the thickness of the film increases in turbulent flow, there is a related change in the bulk concentration profile. For coupled heat and mass transfer, mass diffusivity, viscosity, and reaction rate are strongly temperature dependent. Biofilm thickness varies with fluid temperature. The results of the model are widely applicable in fouling systems. They suggest that for quantitative estimates of coupled heat and mass transfer, computations for particular parameters are necessary. (Titus-FRC)

A PRELIMINARY SITE EVALUATION METHOD FOR TREATMENT OF MUNICIPAL WASTEWATER BY SPRAY IRRIGATION OF FOREST LAND,
Law Engineering Testing Co., Marietta, GA.
G. L. Taylor.
In: Third Annual Madison Conference of Applied Research & Practice on Municipal & Industrial Waste, September 10-12, 1980, p 22-33, 1980. 4 Tab, 12 Ref. University of Wisconsin-Extension, Department of Engineering & Applied Sciences, 432 N. Lake Street, Madison, WI 53706.

Descriptors: *Land treatment, *Wastewater, *Waste treatment, *Irrigation waste water, *Hydrologic budget evapotranspiration, Percolation, Precipitation, Design criteria, Climactic data, Data collection, Topography.

Specific knowledge of the hydrologic and chemical interactions between soil, climate, topography, and vegetation is necessary to properly design land treatment systems and predict with some certainty the long-range impacts of the system. Land treatment system evaluation can be divided into two major phases: site evaluation and hydrologic budget evaluation, with the former being completed first. Seven primary factors are used to evaluate a site for land treatment and to determine if spray irrigation of wastewater can be utilized at a specific site. Nine secondary factors are also used to evaluate the site but are not as critical as site suitability. The hydrologic budget for a spray irrigation, land treatment site has four components: design precipitation, evapotranspiration, percolation of water to the groundwater, and wastewater hydraulic loading. Wastewater must be applied uniformly at the proper hydraulic loading and application rates for adequate renovation. Proper design and diligent management are critical. Unicoi State Park in southeastern United States was used to develop the design information base. Soil percolate samples have shown that the Park has been adequately renovating municipal wastewater for seven years. (Atkins-Omniplan)

SALINE CULTURE OF CROPS: A GENETIC APPROACH,
California Univ., Davis. Agricultural Experimental Station.
E. Epstein, J. D. Norlyn, D. W. Rush, R. W. Kingsbury, and D. B. Kelley.
Science, Vol 210, No 4468, p 399-404, October, 1980. 3 Fig, 3 Tab, 55 Ref.

Descriptors: *Salinity, *Irrigation practices, *Genetics, *Saline water, *Crop production, Water requirements, Irrigation water, Soil chemical properties, Barley, Wheat, Tomatoes, Osmotic pressure, Available water, Adaptation, Fruit crops, Salts, Sea water, Saline water intrusion.

Countries that depend upon irrigation of crops for agriculture are often faced with the problem of high levels of salts in irrigation and groundwater supplies. High salt levels in soils create high osmotic pressures, making water even less available to plants. Since engineering approaches to the problem of water supply salinity can only manipulate the environment to try to provide adequate irrigation water, often at high expense, it was suggested that a genetic approach involving the development of salt-tolerant plants be used to increase crop yields. Although saline soils exist in subhumid regions, they are most prevalent in arid and semi-arid regions. California suffers from high soil salinity in three agricultural valleys. Work done on salt-tolerant plants at the University of California includes experiments on various barley and wheat genotypes and some tomato cultivars. Preliminary results indicate that species tolerant to salt levels near that of sea water should be attained soon in crops of wheat and barley; however, salt-tolerant tomato plants suffer drastic reductions in fruit size and possess limited value for commercial use. Use of certain rhizobial fungi may enhance the salt tolerance of nitrogen-fixing legumes. Grafting techniques have been studied to increase salt-tolerance levels of woody plants and fruit trees. Research is presently being conducted on the mechanisms of salt tolerance in plants. Further work is needed on international collaboration and wild halophytes. Geographical, economic and social areas where research on saline crop culture would have the most benefits should also be considered. (Geiger-FRC)

RECYCLING OF SEWAGE EFFLUENT BY SUGARCANE IRRIGATION: A DILUTION STUDY, OCTOBER 1976 TO OCTOBER 1978, PHASE II-A,
Hawaii Univ., Honolulu.
S. L. Lau, P. C. Ekern, P. C. S. Loh, R. H. F. Young, and G. L. Dugan.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-144669, Price codes: A06 in paper copy, A01 in microfiche. Water Resources Research Center, University of Hawaii, Honolulu, Technical Report No 130, March, 1980. 3 Fig, 21 Tab, 39 Ref, 6 Append. 14-34-0001-3811.

Descriptors: *Sugarcane, *Sewage effluents, *Water reuse, Furrow irrigation, Viruses, On-site tests, Hawaii, Agriculture, Dilution(Wastes).

An extension of the project, 'Recycling of Sewage Effluent by Irrigation: A Field Study on Oahu.' This portion's objective was to determine the dilution with Waiahole Ditch water necessary for optimal sugar yield when chlorinated, secondarily treated sewage was used for irrigation of cane. Hawaiian sugarcane variety 59-3775 was planted to a random-block design of treatments with 6 replicates in central Oahu near the Mililani Sewage Treatment Plant. The 5 irrigation treatments for the two-cane cycle were: (1) ditch water; (2) 12.5%; (3) 25%; (4) 50% effluent diluted with ditch water; and (5) effluent the first year and ditch water the second. The ripener 'Polaris' was applied prior to harvesting. Crop logs monitored the cane growth and test plots were hand harvested for assessment of cane and sugar yield. Soil water percolate and sewage effluent were chemically analyzed to check for human enteric viruses. Sugar yields for effluent concentrations up 25%, or for effluent the first year and ditch water the second.

were equal to those from conventional ditch-water irrigation. There was a significant loss in juice quality and sugar yield for the 50% effluent concentrations. Immediately after each application of fertilizer and with effluent concentrations of 50 to 100%, the nitrate nitrogen concentrations in the percolate exceeded the critical level of 10 ppm for potable water. Total applications exceeded the sugarcane's ability to take up nitrogen; however, an apparent nitrogen deficit was assigned to gaseous nitrogen loss. No virus was recovered but 40% of the effluent reservoir samples were positive. At least 96% of the virus was inactivated after 1 day of storage. (Author's abstract)

3D. Conservation In Domestic and Municipal Use

DISTRIBUTION PATTERNS OF HOME LAWN SPRINKLERS,
Wyoming Univ., Laramie.
G. L. Kerr, L. O. Pochop, J. Borrelli, and D. A. Anderson.
Transactions of the ASAE, Vol 23, No 2, p 387-392, 1980. 1 Fig, 7 Tab, 8 Ref. OWRT B-035-WYO(8), 14-34-0001-7201.

Descriptors: *Lawns, *Sprinkler irrigation, *Application methods, Irrigation practices, *Water conservation, Irrigation efficiency, Municipal water, Testing procedures, Evaluation.

Distribution patterns of six typical lawn sprinkler types were determined during the summer of 1977. Tests were conducted on four sprinklers of each type under three pressure levels. Christiansen's Uniformity Coefficients (UCC) were calculated for the orginal pattern and for various overlaps of the sprinklers. Overlaps required to achieve minimum acceptable UCC values were then determined. The output of each sprinkler was measured and application rates were calculated for individual pattern sizes at the three pressure levels. Two important factors for effective lawn watering are: (1) use of the proper overlap for an individual sprinkler type, and (2) determining the application rate in order to apply the proper amount of water.

WATER-CONSERVING WHEAT IRRIGATION SCHEDULES BASED ON CLIMATIC DATA,
Oklahoma Water Resources Research Inst., Stillwater.
M. B. Kirkham.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-143661, Price codes: A03 in paper copy, A01 in microfiche. Project Completion Report, 1980. 40 p, 4 Append. OWRT-B-045-OKLA(1), 14-34-0001-9129.

Descriptors: *Oklahoma, *Irrigation efficiency, *Wheat, *Irrigation practices, Scheduling, Agriculture, Crop response, Irrigation programs, Water conservation, Semiarid climates, Rainfall, Plant growth, Groundwater, Climatic data.

Irrigation schedules were developed based on correlations between yield and rainfall for the Oklahoma area. Historical records show that wheat yields are best when rain falls within a five day interval in late March. Past irrigation scheduling did not call for water applications to begin until after April 1. The records used to develop the correlations were for spring rainfall and grain yield on winter wheat grown between 1960 and 1977 at Stillwater and Goodwell, Oklahoma. Dates of high correlation were identified and field plots were established to test the resulting revised irrigation schedule. The revised schedule called for 15.2 cm of water applied in 7.6 cm increments on March 20 and April 24. The other schedule, the normal schedule, called for 22.8 cm of water applied in 7.6 cm increments on March 20, April 3, and April 24. A control of plants grown dryland was also used. To quantify plant water stress, plants were monitored for water potential, osmotic potential, stomatal resistance, and leaf temperature. Results show that greater water-use efficiency and higher yields were obtained with the revised irrigation schedule. Four related publications resulting from Office of Water Resources and Technology funding are attached. (Seigler-IPA)

4. WATER QUANTITY MANAGEMENT AND CONTROL

4A. Control Of Water On The Surface

A SYSTEMS APPROACH TO SOLVING RESOURCE ALLOCATION PROBLEMS WITH MULTIPLE OBJECTIVES,
California Univ., Los Angeles. Dept. of Engineering Systems.
G. A. O'Keefe.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-140683, Price codes: A04 in paper copy, A01 in microfiche. M.S. Thesis, 1980. 45 p, 5 Fig, 8 Tab, (California Water Resources Center Project UCAL-WRC-W-576). OWRT-A-077-CAL(1).

Descriptors: *Resource allocation, *Model studies, *Economics, *Conjunctive use, Water management(Applied), Water storage, Water supply, Optimum development plans.

A resource allocation program is developed to assist in basin management where there are multiple objectives. The problem involves the allocation of: (1) water from groundwater and imported supplies to the users of a watershed, (2) wastewater from each user to the treatment plants of the region, and (3) treated water from the treatment plants to the disposal sites. The objectives which are of concern are minimization of the total cost of transporting and treating the water, and optimization of the water quality in the groundwater basin. The program consists of a simulation model, a single objective optimization model and a modification subroutine. The simulation model utilizes the Gauss-Seidel method of finite differences to solve the governing equations for groundwater flow and mass transport. Flow values for this model are obtained from the allocation pattern derived from the single objective optimization. The output from the simulation model is the final water levels and quality for the given allocation plan. An iterative procedure is then used to generate further allocation plans. This is done by varying the coefficients of the objective function in a consistent pattern so that an improvement in the second objective is obtained at each step. Three separate modification procedures are developed and tested, each one utilizing a different method to update the objective function. All three methods were found to be similar in their final results, the only major difference being rates of convergence and total cost. The program is tested on a hypothetical basin set up for this project, using each of the modification processes. All three methods traced the identical solution. (Snyder-Calif)

EXPANDED FLOOD PLAIN INFORMATION STUDY WILLOW, ALASKA.
Corps of Engineers, Anchorage, AK. Alaska District.
Report, June, 1980. 112 p, 11 Fig, 4 Tab, 23 Ref, 7 Append.

Descriptors: *Flood plains, *Flood forecasting, *Land use, *Urbanization, Planning, Flood damage, Flood stages, *Alaska, Computer models, Watershed management, Economic impact, Hydrologic aspects, Environmental effects, Habitats, Maps.

The Willow Creek area is the proposed site for a new capital city for Alaska. Hydrologic, economic and environmental information were developed for use as a decision framework for State and local officials relative to the implications of land use change, based on the existing (1978) land use condition and two assumed land use conditions. Three flood plain regulatory policies were also evaluated to determine their effects on future flood damage potential. A data management and comprehensive analysis system was developed for this area. The system is not limited to flood plain management aspects, but is also capable of addressing many other aspects of Water Resource Planning. The analyses centered on the use of a computerized grid cell data bank containing spatially specific data. The future land uses in the Willow Creek basin will increase the frequency and the depth of flooding. Encroachment on the flood plain will also increase flood stages and flood damages. Future flood damages can be reduced if future construction allows for the hydrologic effects of that development. Increased growth pressures will cause a conversion from rural to urban habitat types. Therefore, there will be a decrease in number and diversity of species and stability of community types. (Moore-SRC)

AQUATIC PESTS ON IRRIGATION SYSTEMS, IDENTIFICATION GUIDE,
Water and Power Resources Service, Denver, CO.
N. E. Otto, T. R. Bartley, and J. S. Thullen.
Available from Supt. of Documents, GPO, Washington, DC 20402. A Water Resources Technical Publication, Second Edition, 1980. 96 p, 37 Fig, 26 Ref.

Descriptors: *Irrigation systems, *Invertebrates, *Aquatic weeds, *Phreatophytes, *Nuisance algae, Aquatic plants, Submerged plants, Aquatic animals, Floating plants, Weeds.

Extensive infestations of obnoxious plants and certain aquatic animals cause problems on irrigation systems, such as reduction in carrying capacity of the system, increased evaporation and seepage, clogging of structures, adverse environmental impacts, and water loss through transpiration. This simplified identification guide was prepared in response to requests from irrigation project operators and other personnel involved with biological problems requiring identification aids. An illustration and narrative description are provided for some of the commonly observed organisms that become pests of irrigation systems in the Western United States. Submersed aquatic weeds, algae, floating aquatic weeds, emersed aquatic weeds, marginal weeds, woody plants (phreatophytes), and invertebrate aquatic animals are included. The illustrations include drawings of the entire organism, with inserts to depict key identifying features. (Moore-SRC)

THE EFFECT OF PHOTOCHEMICAL TREATMENT OF WATER ON ALGAL GROWTH,
Volcani Inst. of Agricultrual Research, Bet-Dagan (Israel). Inst. of Soil and Water.
A. J. Acher, and A. Elgavish.
Water Research, Vol 14, No 5, p 539-543, May, 1980. 3 Fig, 2 Tab, 17 Ref.

Descriptors: *Algae, *Growth rates, *Dyes, *Chlorophyta, *Dinoflagellates, Phytoplankton, Water quality, Lakes, Eutrophication, Laboratory tests, Solar radiation, Toxicity.

The effects of various concentrations of dye-sensitizer at different sunlight exposure times on the destruction of algae in batch cultures of three algae from Lake Kinneret were determined. The Lake is subject to algal blooms which impair its water quality, thus algal destruction was desirable. Peridinium, Pediastrum, or Cosmarium were inoculated in an artificial medium containing either rose

bengal (RB) or methylene blue (MB) and incubated in a controlled environment (20 plus or minus 2C, 14 hr light, 10 hr dark) for about 35 days. Some of the samples were sunlight-irradiated for intervals of 10-120 min prior to incubation. In Pediastrum cultures, the addition of 0.40 mg MB/liter or 1.50 mg RB/liter resulted in the complete destruction of algae after 7 days. The Peridinium cultures were destroyed with 0.50 mg MB/liter of 2.0 mg RB/liter after 15 to 25 days. In Cosmarium cultures 0.75 mg MB/liter of 1.20 mg RB/liter was required for algal destruction in 20 days. For Pediastrum and Peridinium, the dye concentrations necessary to achieve complete algal destruction in cultures exposed to sunlight were about half those required in cultures not subjected to solar radiation. In the case of Cosmarium, the MB concentrations were the same with or without sunlight exposure, but the incubation time for algal destruction was about half. In all experiments performed, MB showed a greater algicidal effect than RB. (McKeon-FRC)

AERATION AS A TOOL TO IMPROVE WATER QUALITY AND REDUCE THE GROWTH OF HYDRILLA,
University of South Florida, Tampa.
T. N. Cooley, P. M. Dooris, and D. F. Martin.
Water Research, Vol 14, No 5, p 485-489, May, 1980. 6 Fig, 2 Tab, 14 Ref.

Descriptors: *Model studies, *Aquatic weed control, *Aeration, *Water quality, *Nutrients, Lakes, Freshwater, Rooted aquatic plants, Aquatic weeds, Submerged plants, Bubbles, Oxygenation, Nitrogen, Carbon, Iron, Phosphorus, Calcium, Hydrogen ion concentration, Zinc, Magnesium, Trace metals, Essential nutrients, Plant growth, Water pollution.

The effects of aeration upon the macronutrients carbon, nitrogen, phosphorus, iron, calcium, and magnesium and some trace elements were examined in a model lake system. The use of aeration as a technique for the control of the aquatic rooted submerged plant Hydrilla verticillata was also examined. This plant has been recognized in Florida as a nuisance weed since the mid 1960's. Growth of Hydrilla was reduced by 20% fresh weight and 18% dry weight after an average of 21 days of aeration. Decrease in Hydrilla growth was attributed to oxygenation of the water and not the mechanical action of bubbling, as shown in studies with bubbles of pure nitrogen. Aeration caused a deterioration in general water quality. Aeration decreased inorganic carbon and nitrate-nitrite-nitrogen levels, while it caused elevations in dissolved oxygen levels and pH. No effects due to aeration were found on phosphate-phosphorus levels; however, decreases were noted in the concentrations of calcium, iron and zinc. After 7 days of aeration, iron levels decreased to less than 20 ppb. Iron depletion was significantly correlated with reduction of Hydrilla growth, and iron deficiency was suspected as the limiting factor in the model lake-Hydrilla system. (Geiger-FRC)

EFFECTS OF CHANGES IN SURFACE WATER REGIME AND/OR LAND USE ON THE VERTICAL DISTRIBUTION OF WATER AVAILABLE FOR WETLAND VEGETATION, PART I, DYNAMIC MODEL OF THE ZONE OF AERATION,
Arkansas Water Resources Research Center, Fayetteville.
R. N. MacCallum.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-145047, Price codes: A04 in paper copy, A01 in microfiche. Project Technical Completion Report, Publication No 70, June, 1980. 60 p, 7 Fig, 6 Tab, 51 Ref, 4 Append. OWRT-A-023-ARK(3).

Descriptors: *Mathematical models, *Wetlands, *Zone of aeration, *Algorithms, *Vegetation, *Arkansas, Kansas, Computer models, Groundwater movement, Hydrologic models, Model studies, Research and development, Mathematical studies, Mathematics, Vegetation effects, Hydrologic aspects, Hydrology, Planning, Seasonal, Transpiration, Precipitation(Atomspheric).

The primary objective of this study was to develop a dynamic mathematical model of the zone of aeration fo wetlands which describes the vertical distribution of water available for use by vegetation. A mathematical model reported by Green, Dabin, and Khare for simulating one-dimensional vertical groundwater movement in unsaturated soils of the Kansas prairie region, was adapted for use in a wetlands environment, typified by the Eastern Arkansas wetlands forest. The adapted model consisted of two second-order non-linear partial differential equations, and an algorithm for their numerical solution. The original model was extended to include functions for seasonal changes in transpiration and for drainage of excess precipitation. Prior to the addition of these two functions, model reliability was limited to one growth season. Interactions between hydrologic changes and long-term vegetative changes can be studied with the model. The model provides a potentially versatile management tool to assist prediction of the environmental impact of proposed flood control projects. The model was programmed for the IBM System 360 computer, and theoretical data pertinent to the Arkansas Delta region was developed. (Zielinski-IPA)
